THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . . .

An Architectural Causerie.

The Last of Highgate Archway.

Old Highgate Archway has just disappeared, to give place to a new, a more pleasing, and much more convenient structure which itself has been progressing to its final completion while the old landmark has been in course of demolition. Highgate Archway has ever since 1813 served to mark the northern approach to London. Spanning the deep cutting through the crest of Highgate Hill, and made at that period for the purpose of providing an easy and direct route on the Great North Road out of London, instead of by the steep and circuitous road over North Hill, Highgate, it carried Hornsey Wood Lane across the cleft thus formed, and was useful if not beautiful. Before it and the cutting were made the rural districts of Finchley were quite cut off from London by these comparatively Alpine heights, which were, as the old coachmen expressed it, "a murder to horses." Accordingly, in the early years of the century a commercial enterprise was started for the purpose of tunnelling through the hill-top, and the work was in full progress when it was brought to a stop by the collapse of the tunnel. Highgate Hill is a great outstanding knob of London clay, a substance both difficult and dangerous to pierce. The falling in of the works took place one day in April, 1812, happily before the workmen had arrived on the scene of their labours. After this happening, it was decided to make an open cutting, and the existing Archway Road, rather over a mile in length, was thus formed, with the great Archway half way along its course. That now vanished building was scarcely necessary at that time, for Hornsey Wood Lane was never at any period a place of great resort, and the traffic along it could have been diverted at small cost, and with little inconvenience made to cross the Archway Road by a circuitous route passing either its southern or northern approach. Nor, indeed, is the Lane even now more than a quiet byway, and were it on that account alone the old and ugly Archway might well have been suffered to remain. But the advancing tide of London's brick and mortar has brought a vastly increased traffic along the Archway Road, and the heavy piers of the structure, which narrowed the footpaths and occupied three parts of the roadway, blocked local improvements. Therefore it has had to be removed, to be replaced by an elegant iron and steel arch, whose abutments are placed far back on either side of the cutting, which will give room for any conceivable widening that is ever likely to be required. This work has been an undertaking of the London County Council, and bears the arms of the various parishes and districts financially interested.

It must by no means be supposed that the making of the original Archway and of the road leading through it was a public-spirited act. It was the work of a company, whose total expenses were very large and whose tolls, exacted at the toll-gate at the southern end of the Archway Road, were proportionately high. Even pedestrians, not chargeable as a rule, paid their pennies here, and sixpence was levied on every laden or draught horse. It was not a profitable undertaking, even at these rates, and the tolls had a very decided effect in stemming the advance of Suburbia in this direction. In 1861, when the abolition of tolls within a radius of 50 miles from London was a burning question, the company owed the Consolidated Fund no less than £13,000. The Government bought it out for £4,000, receiving £9,000 in instalments spread over fifteen years, after which period the road was to be declared free. The Archway Road was accordingly opened free of toll in 1876.

C. G. H.

HIGHGATE ARCHWAY. DRAWN BY C. G. HARPER.

The R.I.B.A. and the Registration Bill.

The attitude of the R.I.B.A. on the matter of "the statutory examination and registration of architects" has been aptly likened by a Fellow of the Institute at a recent provincial meeting to that of "the dog in the manger," and he possibly had in his mind at the time the statement in opposition to the Bill issued by the R.I.B.A. to members of the House of Commons when the measure was set down for the second reading last month. This statement is on the lines of the petition presented by that body some ten years ago against the Bill, and the old arguments are again raked up, one of the objections being that all who were actually practising architecture prior to a fixed date will be entitled to register, purposely ignoring the fact that any proposed Act of Parliament, in order to receive consideration must protect vested interests. It is also suggested that in spite of the Bill any person could practise architecture under the title of "Surveyor," a fallacy which need not be enlarged upon here.

Again, it is stated that the Bill defeats its avowed objects by exempting the professional members of the Institution of Civil Engineers and the Surveyors' Institution. These two bodies were included in the first Bill, but very naturally objected, and were left out when the Bill was reframed and introduced in its present form, and if the R.I.B.A. were as representative of the architectural profession as the other two institutions are of theirs there might not be such urgent need for statutory registration, as the R.I.B.A. would then be, as it should now be, the *one* representative registering body; but as it only registers less than one-tenth of the architects in the British Isles it cannot be looked upon, in spite of Royal Charters, as otherwise than a voluntary Metropolitan Association, membership in which is a luxury rather than a necessity to the very large majority of architects.

It is difficult to follow the R.I.B.A. in their contention that the public will gain little by the Bill because the ordinary dwelling-house is not erected as a rule under an architect's superintendence; but even if this were so, and only a little is gained, that is worth something, and while it is not supposed that even

under a Registration Act everyone who wishes to build must necessarily employ an architect, yet, when it becomes desirable to do so, the public would have some guarantee of his qualifications, and the tendency would be to employ architects where now distrust prompts the employment of a "practical" man whose claim to that title is that he is a builder.

It is admitted on all hands that the Institute has accomplished much which it admits may be commendable in the Bill from an educational point of view, but its scope is too restricted, and its well-wishers would desire to see it by one stroke constitute itself *the* educational centre for the training of architects.

In the A.A. Notes for June it is stated that the new President, who was one of the framers of the Bill and has strong views in favour of registration, would be personally prepared to tear it up were the R.I.B.A. to frame a better, and this exactly coincides with the statements publicly made by those who so actively propagate the principle in the provinces that if the R.I.B.A. will undertake the matter the younger society will step aside, give them the benefit of what has already been done, and co-operate with them in every possible way; and no doubt, were some definite pledge given, even the Registration Bill Committee would withdraw their measure, but only in favour of another introduced by the R.I.B.A.

But opposition to the measure in such a form as that under discussion only tends to lay bare the inconsistency and indecision of the senior body. To place such a statement before Members of Parliament is to give them no credit for common sense and fair-mindedness. These gentlemen, unlike some members of the Institute, rejoice in the fact that they are free to express their opinions on any matter brought before them with absolute fairness, and they may be trusted to give the matter the attention it undoubtedly deserves. The statement, while emanating from the Council of the R.I.B.A., does not express the feelings of the majority of its members, who, being loyal in every possible way, do feel that here is a matter in which they may be permitted to hold opposite views even if they hesitate in every case to publicly express them. It cannot be denied that the feeling in the provinces particularly in favour of an Act of Parliament (not necessarily the proposed Bill) is too strong to be ignored, and that if the Institute do not take up the challenge many who now hesitate to adopt a definite attitude, hoping to see the Institute move, will throw in their lot with the supporters of the movement, and the Institute must eventually yield to outside pressure or be in its turn ignored.

The point is that the *principle* of statutory examination and registration is one upon which all are agreed: it is only on the method of carrying this principle into practical effect that differences arise, and even this finally resolves itself into a question of detail. It is evident that *an* Act of Parliament is the only practical solution to the difficulty. The Bill now before Parliament is opposed by the R.I.B.A. They are invited to frame a better or to find some other means of doing what practically amounts to extending their own examination to all desirous of entering the profession. They will do neither the one nor the other: they consider neither their own interests nor those of the profession at large, preferring to leave questions of this kind to the younger and more active institutions. The dog-in-the-manger attitude is not an impressive or dignified one, and it is apt to pall even upon its admirers if persevered in too long. X.

On Reflection.

A Profound Mystery.

THE statue of Sir Sydney Waterlow in Waterlow Park, Highgate, which was unveiled by the Princess Louise on the 28th ultimo, adds another mystery to the Metropolis. It is asked, as it was of the fountain in the midst of what was once Piccadilly Circus, What does it mean? Looking to Sir Sydney's connection with the Metropolitan Industrial Dwellings Company the statue might perhaps be taken to symbolise the union of Philanthropy and Five per Cent.; the felt hat may indicate the softness of his heart; and the umbrella carefully folded in its case that his company shelters from the weather; but what is the explanation of the key in his left hand? It may possibly mean that the Metropolitan Dwellings Company do not exact "key money" of their tenants as some of the other dwellings companies are reputed to do, but this explanation appears far fetched and is possibly not the right one. The pedestal of the statue presents another subject for cogitation. To what period of Art do the mouldings with which it is adorned belong, and why are some of the members placed upside down? Was the pedestal designed by the architect to the London County Council, who have charge of the park, or was it designed by the Chief Officer of Parks and Open Spaces in his leisure moments? These are some of the questions which suggest themselves to an outsider, and call for a reply. In every other country in the world (with the exception of England) the design of the pedestal of a statue is looked upon as a matter for grave consideration, necessitating the employment of an architect in co-operation with the sculptor, but in this country a square block of stone with a few perfunctory mouldings is all that is deemed requisite, and it may be safely asserted there is scarcely a statue in London with a well-designed pedestal.

An "Arcadian" Suggestion.

"Now Fleet Street is being widened comes an opportunity to beautify it too." So says the "Morning Leader," and proceeds to show, pictorially, how it can be done. There is some reason to fear that tall business premises will rise on the sites of the old "Punch" office and the shop opposite it which lined the narrow passage leading to St. Bride's. In such a case the new buildings would blot out the view of the church which their one-storied predecessors were specially designed to allow. To obviate such a disaster our contemporary comes forward with a suggestion—an artistic suggestion—that it states "would be an ornamental feature in Fleet Street." We are glad to know this, because in the artist's hands the idea becomes truly horrific. We sincerely trust this arcade of glass and iron, covered with a profusion of rococo ornament and destitute of architectural character or feeling, will not rise to quarrel with the Classicism of Wren's steeple in the background. But possibly we are not intended to take this thing seriously; perhaps it is one of those jokes that our daily papers occasionally work off on their suffering readers, an equivalent to the salad joke put forward some months ago by the "Daily Chronicle" as a test of humour. We are egotistical enough to think we can improve the idea. For if the owners of the ground accept the "Morning Leader's" idea, and forego the profits obtainable by letting offices to the Fourth Estate, with a little more inducement they might relinquish the site for an open space, and, with six trees and a few garden seats, what a paradise might be unfolded to the throngs in Fleet Street! The columns of a building paper could not hope to describe it: only the wealth of imagery permissible in our contemporary's columns would do it justice. There the jaded editor, resting in verdure's shade, could gain the inspiration that begets a "largest circulation," and his overdriven sub, taking his daily doze, would dream of the country and the babbling brooks, the cows and the subtle walks in the glimmering twilight, courting the rosy-cheeked ——. But that is another story.

Desecration of the Tower.

ANYTHING more atrocious than the new guard house at the Tower of London could not well be imagined. Not that the building itself is any worse than the general run of buildings designed in the present age; but to set down this fiery red-brick erection with its staring stone dressings under the scarred grey walls of the White Tower, pregnant with a nation's history, is a piece of vandalism that could only be accomplished in the nineteenth century. It would be interesting to know why a new guard house was needed at all, for no one can pretend that the Tower is an active fortress upon whose efficiency the safety of the City in time of war depends, and the garrison it possesses is there placed more as a courtesy to its past power and grandeur, for convenience sake and as a guard to the regalia, than as an active fighting force. As the years go by the public is being gradually shut out of the Tower altogether, and it is becoming evident that from motives of economy the authorities desire to turn the place into barracks and end its more fitting career as a museum of feudal history. But even the total exclusion of the public from the Tower would not justify the destruction of its beauties by such buildings as guard houses, and it is small balm to antiquarian feeling that the Roman citadel foundations and well have been generously preserved while the new erection remains to shriek our shame and inappreciation to the coming generations.

Widening Piccadilly.

THE advantage of widening Piccadilly by cutting off a piece of the Green Park, as proposed by the First Commissioner of Works, is more apparent than real. Our experience of this thoroughfare leads us to believe that the stoppage in the traffic occurs at either end and not in the middle of the street, which would be the part most benefited by the proposed improvement. The police authorities, however, say that the alteration will benefit them in regulating the traffic and we suppose they are the best judges. But if thousands of pounds are to be spent on Piccadilly the question of widening the Circus end should be seriously considered. It will be very costly, but it is a very necessary work, the need of which is more apparent every day. Doubtless the improvement would have to be carried out by degrees; but if further delayed the ultimate cost would be greater than if commenced to-day.

EVERY MAN'S INALIENABLE RIGHT.

SOME HANDICAPS OF AMERICAN PROVINCIAL ARCHITECTURE.

BY E. C. GARDNER.

BY "Provincial Architecture" is meant all architecture that originates outside of Boston and New York in the East, and a few of the largest cities in other parts of the United States. In this discussion of the subject, domestic buildings are not critically considered, because such criticism would be a sort of invasion of private rights, including the right of every man who builds himself a house to make it as ugly and illogical as he pleases, and because it would be necessary to prepare a special dictionary of terms before an intelligible line could be drawn between the utilitarian art of house building and the fine art of architecture.

Concerning the illustrations, it may be explained that they are not given as especially depraved examples of contemporary architecture. It is needless to say that they are not presented as examples to be followed. The most of them are the familiar, largely imitative, and drearily common-place buildings to be found everywhere. They have been achieved by the individual or combined efforts of architects considered "successful" in their local fields and of enterprising business men who are able and willing to leave their "stamp" on the community which educated them, of shrewd business committees whose prominent qualification for their position is a supposed ability to buy the value of three dollars with an expenditure of two, and of public servants who for the time of their official life are called upon to decide affairs of which they are more or less ignorant and for which, under other circumstances, the training of half a lifetime would be thought necessary—sources from which, instead of platitudes with occasional nightmare attachments, something of permanent dignity and beauty should have enriched the time and place in which they have been produced. Although actual and recent buildings, they are not verbally identified; in fact, that is a matter of no consequence, but the accompanying titles will indicate their relation to the text.

The permanent residents of each provincial city in the older portions of the country have certain characteristic social customs and manners, certain modes of speech, certain business habits, and other external peculiarities, easily perceived but not easily described, which give a local flavour and colouring to each community. These include fashions and tastes in building. But aside from such minor variations there is no important difference in the architecture of provincial cities of a certain class, say those ranging from 50 to 250 thousand inhabitants; and in them all it is, as a whole, so poor, so devoid of the merit that entitles a work of art to respectful admiration and careful preservation, that if it were known that all the buildings in any one of them were about to be annihilated it would be difficult to select a dozen which any person having even a rudimentary knowledge of architecture would care to have rebuilt in its present form. That is to say, apart from association and other sentimental motives, there would be found almost nothing worth saving for its architectural excellence. I believe that is true of at least nine-tenths of provincial cities in the United States.

When we consider the liberality, not to say the extravagance of our large business blocks; the ample, not to say wasteful appropriations for school houses and other public buildings; the enormous sums given to churches, educational and philanthropic institutions; the increasing number of educated architects; and especially when we consider the almost unlimited resources in the way of instruction, investigation and imitation afforded by travel, by literature and by the completeness with which all the best architecture of the world from the time that architecture began to be to the present time has been photographed and brought within our easy reach—when we consider all these things, the general worthlessness of the architecture by which we are surrounded furnishes a most amazing instance of the failure of apparently adequate means to reach a desired end.

Remembering what a permanent and conspicuous influence architecture has had upon national character, how from time immemorial it has been the one art that both reveals and determines the character of its creators and contemporaries at any period, it is certain that no greater service could be rendered to the age

ASPIRATION.

we live in than the cure or mitigation of this extraordinary and discreditable state of affairs.

As regards general influences, vanity is perhaps our most ponderous handicap. This appears to be of the deplorable variety which makes us unwilling to confess our ignorance, even to ourselves; unwilling to admit that what we possess, what we invent, what we preach and practise, is not the very best that has ever been done in the way of possessing, inventing, preaching and practising. Of course this painful accusation applies only to architecture. In all other respects we Yankees are doubtless the most modest people on the face of the earth,

THE "ORDERS" ARE THE ARCHITECT'S FIRST LAW.

FOR PRESENT PROFIT AND A JOY FOR EVER.

always excepting our English cousins. This is not implying that everybody is in the darkness of ignorance and the fog of vanity. There are conspicuous exceptions even among laymen; but in the knowledge of architecture it is certainly true of the great majority. Any doubt on this point may be effectually dispelled by a few hours of intelligent observation along the principal streets of any provincial city, the "taste" therein manifested doubtless indicating something above the average intelligence of the entire population.

Leaving ignorance and vanity out of the question as being practically incurable except by the slow processes of evolution, there are several nearer and possibly preventible causes of our architectural poverty. One of the most serious and discouraging is the attitude of the local newspapers. I have never seen or heard of a newspaper, however high its journalistic standards, however earnestly it strives to be impartial, however faithfully and without regard to profit or popularity it espouses what it conceives to be the right side of questions that have a right and a wrong side, however valiantly it tells the truth in other matters of public and private concern—I have never seen or heard of a paper whose influence upon the architecture of its local field was not damaging rather than beneficial. That isn't the worst of it. For the life of me I don't see how it can be otherwise.

Nothing is more essential to the healthful development of art in all forms than intelligent public criticism; judicious recommendation of the good and frank, explicit, detailed condemnation of the bad. Not dogmatic assertions, but impartial judgments, sustained by clearly stated and well-established principles. Music, the drama, landscape, architecture, painting and monumental statuary are criticised wisely and often most helpfully by the competent writers employed by the best provincial journals. But the moment they touch the architecture that lies nearest them, and of which simple but uncompromising criticism would be valuable, their pens are dipped in oil. As I have just remarked, they must be, because here questions of taste and professional ability are entangled with private personal rights and interests. It will not answer to declare in good set terms that the new bank of Mr. A. is an extravagant monstrosity; that the new church of the United States is an abortion; that the forty tenement flats on Blank Street are a hodge-podge in the external design, a small Ghetto and a large fire trap within; it would be a strange piece of insolence and ingratitude to suggest that the library, museum, gymnasium, or Casino that our liberal fellow citizen has presented to the city or town is from the architectural point of view a monument of ignorance and ugliness. On the contrary, each and all of these buildings are sure to be described as fine examples of the skill of the architect, especially if he is a new-comer in town, and of the owner's or donor's wisdom. The reporter's vocabulary is ransacked for suitable adjectives to describe them, both in the main body of his "copy" and in the still more conspicuous and misleading headlines.

Now, it is undoubtedly true, whether happily or otherwise, that the opinions of the great majority of people in all matters æsthetical are largely determined by the comments and intimations of the public journals. So it happens that in architecture whatever the newspapers approve (and to an extent they are obliged to approve every new growth, even if it is a parasite or a mushroom, or be accused of a lack of proper public spirit) is accepted as good, and, woe the day, is sure of imitation. Even if we leave the owners and the donors out of the case, what would the young architect who is just entering upon a career of usefulness say if the work of his budding genius, which may be truly original, should be characterised in the daily papers as both original and ridiculous? How would the old architects whose "ear-marks" appear on all the streets of the city until through long familiarity they have become agreeable, as the odour of the stable is agreeable to the ostler—how would these faithful but helpless old architects like to be told that they were never anything but builders of average intelligence, who learned to wield the T-square in their youth and to copy some of the mouldings that are shown in the reputable old books on the "Orders," or to appropriate the disreputable details of the "middle ages" between 1850 and 1870?

A complete lifting of this journalistic handicap seems impracticable. A partial mitigation of the evil could possibly be accomplished if the papers which maintain a fairly just and able criticism of other forms of art, a criticism that is instructive to laymen and stimulating to the artists, would refrain from all mention of unworthy architecture, commending cordially and in detail whatever is really worthy of imitation and commendation.

The enormous preponderance of poor, or at best negative, architecture (which is perhaps the same thing) and our inevitable familiarity with it is another conspicuous obstacle in the way of architectural reform. This familiarity is not of the kind that breeds contempt; it rather tends to respectful tolerance and ignorant admiration. A common instance of this is found in the prevalence of certain characteristics in dwellings of the medium class in different cities. The residents of other cities find them

THE COMMITTEE WANTED "SOMETHING RICHARDSONESQUE."

FOR THE STUDY OF LITERATURE, SCIENCE AND—ART.

unattractive, if not positively disagreeable. Those who see them every day find them pleasant and home-like. Familiar examples of this are the flat-headed two-storey-and-attic houses, with "cellar windows in the top;" the two-storey buildings with the so-called French roof; the chuckle-headed gambrel-roofed houses covered from sill to ridge pole with an eruption of shingles; the rectangular red-brick block, with solid white shutters, of Philadelphian suburbs. All these and many more are types of what may be called local fashions. (If Philadelphia is not strictly provincial at present, it has a traditional reputation to that effect.)

Now, a house or anything else may be interesting and pleasing to a great number of people simply because it conforms to a prevailing and familiar mode; but art has no more concern with custom and fashion than it has with politics and sanitation. In minor matters fashions change quickly, and their influence for good or bad is of short duration. But in architecture the eccentricities and vagaries which result from the prevalence of some passing vogue are obtrusively permanent above ground long after the only reason for their existence has been dead and buried. The effect of this is as though all the women who ever wore poke bonnets, hoop skirts or "mutton-leg" sleeves must continue to wear them to the end of the chapter and only the rising generation be permitted to invent and follow new fashions. This might lead to a picturesque assortment of costumes, but it would not be more incongruous, variegated and uncouth than the domestic architecture of a modern city and its suburbs. (Having disclaimed any intention of criticising domestic architecture, I ought to say that the above is introduced simply as the most convenient illustration of the influence of fashion in building, an influence that prevails in all classes of buildings, but is the most conspicuous in dwellings.)

The effect of this thoughtless and more or less unconscious preference for what is familiar is distinctly obstructive to such advance in architecture as ought to follow the vast resources and still vaster ambitions of the time in which we live. It throws into popular disfavour everything, however excellent, that is not actually commonplace. It is obvious that any general and substantial improvement in architecture must depend on the right cultivation and direction of popular taste, and this is always guided by what is conspicuously displayed rather than by a knowledge of what is really good. The improvement in architecture that has followed great conflagrations in the last half century shows how much more rapid this popular education would be if this load of vicious example and precedent could be lifted, even if it has to go up in smoke. Now, this form of handicap is relatively far more serious in the cities which I have classed as "provincial" than in those of more cosmopolitan character, because in the former individual instances of departure from established precedent stand out more conspicuously. This is also illustrated in matters of dress, equipages, and in all minor social customs and conventions.

Undoubtedly, the best architecture the world has known in the past has been devoted to the service of religion, either of the kind known to us as Christian or pagan. At the present time the most important, if not the most admirable architectural monuments that can claim any originality are probably found, not among ecclesiastical buildings, which, when not absolutely bad are mainly imitative in spirit if not in actual form, but among those intended for municipal or other public and corporate purposes. It is for such public buildings that the most logical plea for thoroughness, dignity and elegance can be made; upon these the most lavish outlay is expected. We say with great propriety that it is fitting for a rich and intelligent people—I put the short adjective first advisedly—to manifest its wealth and intelligence in the character of its public buildings, whether they are for local or national use.

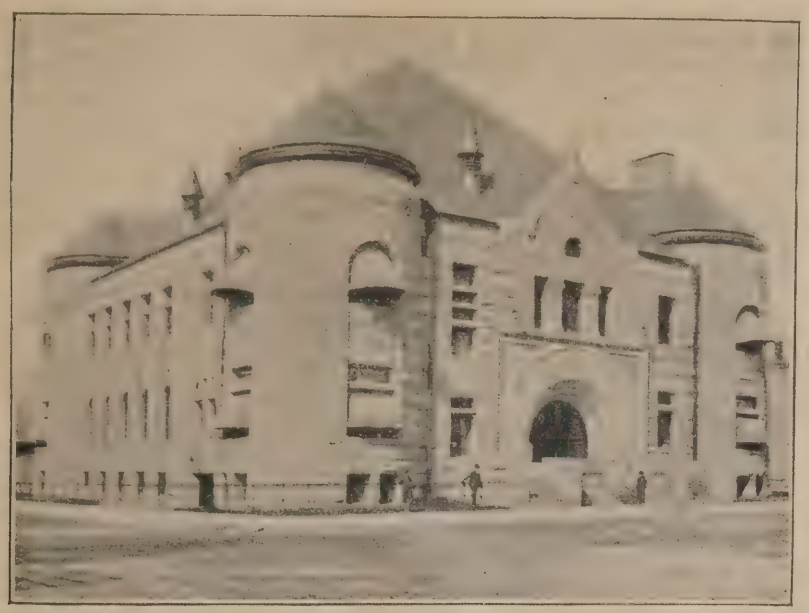
Far be it from me to depreciate the wisdom of our public servants. There is no reason to suppose that the members of city governments, the common councilmen, and the boards of aldermen from among whom the city property committees, or whatever their official titles may be, are chosen, are either more or less ignorant of good architecture and of art than other average laymen, although their ignorance may be more damaging, because more stubborn and aggressive, a generous conceit of his own wisdom and a pachydermatous insensibility to criticism being essential to political success. But the fountain must not be asked to rise higher than its source, and it is futile to expect the best in municipal architecture until its selection is determined by some more trained judgment, by some more special education in the most complex and difficult of all the arts than the accidental knowledge and "taste" of the ordinary "public servant." Even when "experts" are invited to assist in making a decision between rival designs their recommendations are seldom regarded unless they happen to agree with the opinions already formed by the officials who "know what they like" even when they can give no intelligent reason for their preferences, and who are not apt to be altogether pleased by the implied doubt of their wisdom.

It is one of the unsolved puzzles why an

THE PUBLIC SPIRIT OF ITS CITIZENS DETERMINES THE DEVELOPMENT OF A CITY.

PLAINNESS AND DIGNITY ARE NOT INCOMPATIBLE.

otherwise intelligent community should entrust one of its most important functions, one requiring for its wise administration the highest degree of technical skill and special training, to men who know no more of architecture than an unlettered boor knows of astronomy; they have seen buildings ever since they were born, and he has seen the stars. It would hardly be more absurd to appoint from the members of a city government a committee to write medical prescriptions for the patients at the city hospital.



Nearly related to this obstacle is the fact that in small cities there is no proper inducement for the most competent architects to give their services to public work. I am well aware of the ignorance, the vanity, the jealousy, the fantastic notions, the often stupidity and occasional vulgarity of architects; they are mortal men and I may speak of this form of handicap later. But it is also true that there never was a time in the history of the world when there were such ample opportunities for invention, such vast facilities in the way of construction and materials, such a high degree of cultivation among so large a number of architects and such disinterested devotion to lofty ideals as a present. Artistically the States may be behind certain nations of Europe for the moment, but there is no excuse for it remaining so, since everything from the tops of the highest mountains to the innermost recesses of the art schools is accessible. But, as I have said, there is no proper inducement in provincial cities for the best architects to undertake public commissions, for the simple reason that architects are rarely selected for public work on account of the excellence of their plans or of their established reputation for rectitude and ability. The city in which it is my happy lot to reside is not more culpable, less righteously governed, or more indifferent to good architecture than other cities of its class; but I am confident that there has not been a public building of any sort erected by this municipality, since it became the custom to employ architects, the plans for which have been adopted solely for their architectural merit. Various degrees of personal and political influence have been exerted. It is undoubtedly true in cases of competition that the best plans have sometimes been selected, but when that has occurred it has not been on account of their excellence alone; the verdict has been affected by some other motive, not, perhaps, of sufficient weight to have led to the adoption of the least meritorious among several plans, but quite sufficient to have brought in the second or third best if the same influence had happened to go towards them. It would seem possible to mitigate if not entirely to remove this difficulty by the adoption of such competitive conditions as would make sinister influence impossible, but who shall ensure the faithful observance of the conditions? So, after all, the matter comes back to the old, old story of upright men in public places.

An apparent cause of the poverty of provincial architecture is the incapacity of provincial architects. This is not as serious as it seems, for the reason that there are few cities in which there is not at least one thoroughly trained architect, who only needs the opportunity afforded by the larger wealth and enterprise of the great cities to do as good work as can be found where those favourable conditions exist. But there does also appear to be in the smaller cities a larger proportion of nondescript "Practical Architects and Builders" who for personal and supposed economical reasons are liable to be employed as architects by men who care little and know less of what might be done in the way of excellent design even for the most simple and inexpensive structures. Especially do personal motives enter into the question of selecting the architect. A man who would not think of employing a friend or relative to paint his portrait for the edification of his posterity, or even to take his photograph, still less to set a broken bone on account of his friendship or relationship, does not hesitate to give him a "job" in architecture in order to help him in business. The consequence of this kind of personal favour is conspicuous and abundant. It is common enough in great cities, but in them it is less marked and has less influence upon public taste.

Another marked condition in the subject under discussion is the prevalent custom of entrusting important work to some architect away from home. Instead of improving the local architecture by exciting a healthy emulation, this is more likely to have an opposite effect. Fifty, or perhaps in some sections thirty, years ago, there were few but "home-made" architects, evolved from lazy or ambitious carpenters, in the small cities. Then it was inevitable that really good work must be obtained out of town. At the present time, as I have said, there is scarcely a city even among the smaller ones in which at least one architect with as good training as the best schools in this country and Europe can give has not hung out his shingle. If the work that really calls for superior professional skill is sent away from such a competent resident architect he soon decides that there is neither honour nor reward for the prophet who stays at home. Naturally he abandons the field to the second- and third-rate men who always stand ready to rush in, and who never rise above the dead level of mediocrity. Owing to this same sort of prejudice, if local architects are liable to compete with those from outside there is likely to be a

ROMANESQUE AS SHE IS SPOKE.

THE "BROWNIES" IN ARCHITECTURE.

decided bias in favour of the outsiders. This is commonly disavowed, especially by public officials who have political ambitions, but not always. In a recent competition for an important public building in a New England city one of the building commissioners who was to assist in the selection of the plans that were to be submitted openly declared before his appointment was confirmed that he should surely oppose the acceptance of any plan presented by any local architect, regardless of its merit. It is difficult to say which was the most amazing—the fact that local architects should have been willing to compete under such circumstances or that the man should have been appointed to serve on a commission whose members would be gravely compromised by any deviation from strict impartiality. But then his official position was not obtained by popular franchise and he was himself a local architect. I mention this as a clear and I believe a by no means unusual instance of the lack of high ethical standards in the business relations of architects and their possible clients, as well as one of the forms of handicap to which provincial architecture is peculiarly subject.

On the other hand, a more serious blight sometimes comes from the small politicians who endeavour to increase their own chances of popular favour by a pretence of public spirit in the employment of so-called "home talent." This handicap prevails most disastrously in the large towns and small cities whose local business is not sufficient to tempt men of more than mediocre ability. This is all the more deplorable because the best sites for the display of good architecture are found where land is abundant and inexpensive, and where there is an opportunity for the skilful adaptation of the architectural design to natural surroundings, which, though not always grand, may at least be striking, picturesque and generous.

To give one more instance in a list that might be considerably extended, I think it is true that in provincial cities of the middle and larger class there is, in comparison with the great cosmopolitan cities (perhaps on account of the lower cost of living) an increased proportion of untrained, incompetent and unprincipled architects, men who try to obtain work by dishonest means, who seek and accept illicit commissions, and, alas for poor humanity, who fancy it is possible to exalt their own work by disparaging their contemporaries. And it is not alone the local irregularities and rascalities that must be encountered, but work that might be expected to be done by the resident architects of the smaller cities seems to be considered fair plunder by the dishonourable practitioners and professional drummers of the big ones. Men whose reputation at home is still comparatively undamaged, and who would shrink from unprofessional practice where they are well known, appear to feel that any means of thrusting their hands into the public crib of the smaller cities is permissible. That is to say, the line that separates honourable business enterprise from unprincipled wire-pulling and sinister scheming seems to be more easily crossed among strangers.

It is hardly necessary to say that some of these obstacles in the way of good architecture exist everywhere. The only reason for including them in this category is that in "provincial" regions they are greatly exaggerated.

DWELLINGS FOR THE POOR.

THE report of Bailie D. M. Stevenson, who attended the Congress on Cheap Dwellings held at Paris on the 19th, 20th and 21st of June, has been submitted to the Glasgow magistrates and has received their approval. The report stated that although there was divergence of views as to the best methods to be employed, there was absolute unanimity as to the urgent need for dealing with the problem of the housing of what they called the "disinherited classes" on a much more extensive scale than has ever been contemplated so far. The leading French members favoured a great extension of the system of building societies for the erection of tenement houses—"maisons collectives." Some of these societies have been remarkably successful (notably in Paris, Lyons, and Marseilles) on the lines of the Glasgow Workmen's Dwellings Company, but other delegates pointed out that it was hopeless to expect the work to be done adequately by semi-philanthropic agencies, seeing that for Paris alone not less than five hundred millions of francs—£20,000,000 sterling—would be required, and therefore that legal sanction ought to nable local authorities and savings banks to lend the necessary capital to such societies at the rate of interest current for public funds. The question of model lodging-houses—"maisons garnies collectives"—was very fully discussed. The reporter, M. Paul Langer, after investigating the work done in a number of countries, had come to the conclusion that the houses erected by Lord Rowton in London, where lodgings for men were provided at 6d. a night, ought to be copied and extended as rapidly as possible in all large cities. Bailie Stevenson explained to the Congress that, whereas Lord Rowton's lodging houses had only been recently erected and were for men alone, the Corporation of Glasgow had built separate lodging houses for men and women thirty years ago, at which the nightly rent was from 3d. to 4½d. per person; that a family home had been erected by the Corporation five years ago for the accommodation of widows and widowers with children dependent upon them, and that, although the family home does not yet show profit, it is on the fair way to do so, while the whole enterprise—capable of housing 2,700 to 2,800 lodgers—yields an overhead annual return of fully 5 per cent. on the capital invested. Wednesday, June 20th, was given up to the discussion of cottage homes—"maisons individuelles"—and the best means for enabling workmen and artisans to become owners of them.

A most interesting discussion was that on the subject of "Under what form is the intervention of the State, of municipalities, or of public bodies possible and desirable in the construction of cheap dwellings?" The reporter in this case was M. Eugene Rostand, of Marseilles, Member of the Institute of France, President of the Savings Bank, &c., who summed up the result of careful inquiries into the whole question in France, Great Britain, Germany, Belgium, Holland, Denmark, Sweden, Austria, Russia, and even Brazil, in three conclusions:—I. That the direct intervention of public authorities as formulated by the Socialist schools is incapable of examination, based as it is on a collective hypothesis which has never been properly defined, or on a similarity which does not exist between needs in respect of housing and needs in respect of public services, such as the post office, railways, lighting and drainage. II. That the direct intervention of public authorities as formulated by the State schools—"écoles étatistes"—(a) Is in itself illegitimate; (b) Is useless; (c) Would be less productive; (d) Would be incapable of rendering the service more cheaply. III. That public bodies have, nevertheless, a precise and considerable part to play in the movement for the amelioration of the housing of the people. M. Rostand laid particular stress on his second conclusion, and the bulk of the audience appeared to agree with him.

In the discussion which followed, Bailie Stevenson, as representing the Corporation of Glasgow, strenuously controverted the second proposition on the following grounds: (a) That a city can have no higher duty than the proper housing of its citizens, particularly those who are least able to look after their own interests; (b) That it is hopeless to expect philanthropic enterprise to provide anything like the amount of capital required; (c) That experience of the public enterprises carried out by the Corporation of Glasgow, such as gas, water and tramways—the explanation of which, by the way, came as a great surprise to the audience—proved, on the contrary, their superiority over similar works executed by private bodies. (d) That the very opposite results had been obtained in Glasgow, where, notwithstanding similar prophecies, there had been no need to "falsify the natural play of things at the expense of the ratepayers."

After further discussion, a compromise was arrived at: the first and second conclusions were withdrawn, and the Congress agreed that it was not wise, meanwhile, to adopt any absolute generalisation; that it was preferable to remit the whole question back for further consideration to the bodies who had sent delegates, seeing that the form of intervention by the State and by municipalities is susceptible of variation, according to the constitutions of the respective countries, their habits and customs, and the gravity of the evil requiring to be remedied; and that, therefore, the whole matter had better be reported upon again, and discussed at the next Congress, to be held at Dusseldorf in 1902, in the light of the further information which will be forthcoming.

Alterations to Holy Trinity Church, Stepney. Dr. Tristram, Q.C., Chancellor of the Diocese of London, in the Consistory Court of London, granted last week the faculty asked for by the vicar and churchwardens of Holy Trinity, Stepney, to authorise alterations and improvements in the church. It is desired to form a chapel at the north end of the east aisle of the church, to place a holy table there for use for small congregations, to erect vestries on either side of the south end of the church and a parish room on top of them extending across the south end of the church, and to enlarge the chancel. The work will cost about £2,000, which sum is to be raised by contributions.

MANCHESTER SANITATION.

MR. G. V. POORE, writing to the "Times," calls attention to the highly successful issue of an experiment conducted at Manchester. The difficulties of Manchester in getting rid of their accumulations of refuse have been unusually great, because the ordure from nearly 80,000 small houses has to be systematically removed and dealt with.

It was in 1886 that the city of Manchester bought the moorland known as Carrington Moss, separated from Chat Moss by the Ship Canal, with the object of providing an outlet for its refuse. The Carrington estate is 1,100 acres in extent, and was mainly an unmitigated peat bog, having an average depth of about 13ft. Considerable sums have been spent on the construction of a wharf and farm buildings, the cutting of deep trenches to facilitate drainage, the making of roads and the provision of narrow tram lines. In 13 years this estate has received more than half a million tons of refuse from Manchester—ordure and muck for fertilising, clinker and hard material for road making—and to-day the city finds itself in possession of one of the most fertile tracts of land in the country, the whole of which is let to first-rate tenants at an average rental of £2 per acre. These tenants use some 25,000 tons per annum of manurial matter, for which they pay the Corporation at the rate of 1s. 3d. a ton, and thus the Carrington estate returns some £3,500 per annum to the ratepayers, while the outgoings tend gradually to dwindle. Carrington is not a "sewage farm." The muck is dry, and is spread on the surface of the land and ploughed in in the ordinary way. There is no excess of water. Sewage farming in which the living humus is drowned by tons of water leads surely to agricultural bankruptcy. Mr. Poore has had ocular proof of the fertility of this reclaimed land. The hay harvest was just over and had been a good one, and the standing crops of wheat and oats, potatoes and carrots would be hard to beat in any part of England. The wheat was especially good, and one field of 17 acres, which Mr. McConnell, the manager, estimated would yield over 40 bushels to the acre. Much of the land is now passing into the hands of nurserymen and market gardeners.

The physical change which has taken place in this bog as the result of the agricultural and other operations which have been carried out upon it is very interesting. The downward drainage by the deep trenches and the upward drainage by the heavy crops, which to a large extent prevent the rain from percolating, have resulted in the sinking of the surface and the general compression of the bog so that the land tends steadily to get firmer. Formerly, when ploughing it was necessary to put "pattens" upon the horses' feet in order to prevent them from getting "bogged," but this necessity now seldom arises. The farmhouse at Carrington stands on solid and deep foundations, but that the land around it is gradually sinking is well shown by the fact that it is found necessary to provide an additional step for the back door at recurring intervals. Mr. Poore suggests that this great experiment merits systematic observation by men of science. A few "surface" wells for the periodic examination of the water by chemists and bacteriologists are much to be desired, and the changes of earth temperatures, the progressive alterations in the physical condition and the flora and fauna of the soil ought to be systematically recorded. The success attained at Carrington Moss has induced the Corporation to purchase some 2,500 acres of Chat Moss, which is now being subdued under the experienced guidance of Mr. McConnell, so that eventually the Corporation will be in possession of a fertile estate of 3,600 acres. Allowing 10 per cent. for roads and other works they will have about 3,240 acres under cultivation, or land capable of producing annually 13,000 quarters of wheat and 8,000 tons of straw where none grew before. Assuming that the land is capable of receiving 20 tons of refuse per acre *in perpetuo*, the city will be in possession of a "destructor" capable of consuming about 65,000 tons of organic refuse per annum, and each ton of refuse will ultimately return about a bushel and a half of wheat and 2½cwt. of straw (the chief ingredients for 100lb. of bread and perhaps 1,000 straw hats).

NEW SCHOOL AT LEEK.

THE Technical and High School at Leek, illustrated in one of our inset plates, was opened on July 28th, when the foundation stone of the William Carr Gymnasium (Nicholson Institute) was laid. The school buildings have been erected for the Leek School of Science and Technology and High School and County Silk School. The gymnasium is the gift of Mr. William Carr, of Leek.

The school buildings are of simple proportions, with embellishments sparingly introduced. The front is built of thin Wall Grange sand-faced bricks, the window frames being put in on the outer face and painted white. The lunettes over these windows—under the arches—are filled with decorative modelling by Mr. A. Broadbent. The subjects on the front include literature, science, art, music, agriculture, commerce and physics with chemistry. There are other subjects on the east side, such as needlework, weaving, manual instruction, dyeing, cookery and astronomy. A covered portico connects the existing school of art with the front entrance to the new schools, which is surmounted by Justice on one side and Time on the other. A number of old cottage buildings have been pulled down, enabling spacious quadrangles to be formed on the south front and on the west side of the new school buildings. These will be planted and laid out as town gardens for the use of the public. The playgrounds for the day scholars will be formed on the north side of the new buildings, looking out towards the park and the Roches, &c.

On the east of the new schools the erection of the William Carr gymnasium has been commenced. Mr. Carr has generously provided £1,000 for the erection and furnishing of this building. It has an octagonal tourelle at the front angle, which merges into a circular frieze to be sculptured by Mr. Broadbent in stone: subject, The Olympian Games. The roof will be of copper. The gymnasium itself is 70ft. in length by 28ft. in width, and has a raised platform at one end and a gallery for spectators at the other. It has also spacious dressing rooms and a lavatory with shower-bath, &c. Two decorated plaster ceilings—taken from the ancient manor house in the market place, recently pulled down—were acquired by Sir Thos. Wardle, who has presented them to the gymnasium, where they will be fixed. The fitting up and apparatus of the gymnasium will be fully up-to-date, as in the most modern military gymnasia.

The accommodation in the school is as follows:—On the ground floor: Chemical laboratory, 31ft. by 22ft., with benches for twenty students, blow-pipe table, shelving, &c., four fume closets, combustion counter, demonstration table and sliding blackboard and eight nests of bain-marie dye pots for experimental dyeing. Attached to the chemical laboratory is the balance room, 15ft. by 7ft., with shelves and stone slabs for the balances. The domestic school (cookery and laundry) is 27ft. by 22ft., and is fitted up with desks, demonstration table, kitchen range and gas stoves, sink, cupboards, shelving, sliding blackboard, laundry tables, &c. The physics laboratory is 27ft. by 20ft., and has a demonstration counter and platform with sliding blackboard, long side table, cupboards with sinks, three double benches for twenty students, apparatus cupboards, blow-pipe table, suspension rail, &c. The manual instruction room and weaving shed are lighted by north skylights. The manual instruction room is 29ft. by 20ft., and contains ten double wood-working benches, one master's desk and platform and sliding blackboard, one side-table cupboard, tool racks, timber cantilevers, &c. The weaving shed is about 30ft. square, and contains a Crossley's gas engine indicated 8 brake h.p. of the latest type, two lines of polished steel shafting, &c., and various power and hand looms and machinery connected with silk working and spooling, &c. The engine is enclosed in a pilastered plate-glass screen with wire-wove glass roof. The ground floor also comprises chemical and other store rooms, boys' lavatories and cloak rooms, separate entrances for boys and girls, a crush hall (in which are placed the male students' lockers), corridors, &c. The height from ground floor to first floor is 16ft., but the weaving shed and manual instruction rooms are higher. A mezzanine floor is formed off the staircase, giving a mistress's common room and cloak room, &c., and a bay for the girl students' lockers. All the appointments of the administrative rooms — fire-grates and fenders, coal boxes, inkstands and gas fittings have been designed by the architects. The first floor varies in height from 14ft. to 18ft. On the first floor is the lecture theatre, 31ft. by 22ft., with steep gallery constructed on the "isacoustic curve" principle, which ensures every student seeing over those in front of him. This room is furnished with electric lantern, lantern screen, diagram screen, sliding blackboard, fume closets, demonstration counter, dark blinds to the windows, &c. Opening from the lecture theatre and giving access to the Nicholson Institute reading room is the preparation room, which also adjoins the head master's room, 13ft. 6in. by 15ft. The head master's room is furnished in the same way as the head mistress's. On the north end of the first floor is the kindergarten classroom, 34ft. by 20ft., furnished with the newest and best appliances in kindergarten single desks, tables, chairs, &c. It has also portable blackboards, stock cupboard, teacher's desk, &c., and the walls are hung with a selection of Fitzroy pictures. The west classroom is for thirty-two students, and is 25ft. by 22ft. The east classroom is for thirty-five students, and is 20ft. by 23ft. The girls' cloakroom, lavatories, &c., are upon this floor. On the upper floor, which is about 13ft. in height, is a large classroom or continuation of the domestic school for needlework, dressmaking and millinery, 43ft. by 20ft., a music room, 16ft. by 13ft., and an administrative office, 21ft. by 14ft. (which gives access to the Nicholson Institute galleries). This contains some curious painted chestnut wainscotting from the Chateau de Lormant, near Bordeaux, formerly the residence of the Archbishops of Bordeaux, whose arms appear on the panels. The Black Prince lived in this chateau, and his son, Richard of Bordeaux, was born there. The wainscotting was rescued from destruction by the architect, Mr. Larner Sugden. It had been torn out of the chateau and made into a fowl-pen at a farmhouse.

Messrs. W. Sugden and Son, F.R.I.B.A., of Leek and Hanley, are the architects for the buildings and their furnishing and equipment. The builders are Mr. T. Grace and Mr. M. Carding, of Leek. Messrs. Truswell and Sons, of Newcastle, have put in the heating apparatus. The furnishing has been done by Messrs. Overfield and Co., of Leek, and the Bennett Furnishing Company, of Glasgow. The wood used for the fittings is Orham stained green and French polished. The decorative metal work is by Messrs. Ramsden and Carr, of Fulham. The laying out and planting is being done by Mr. M. Mellor, of Leek. The rooms throughout have glazed brick dados and distemper colouring in cheerful but subdued tints. The outlay on the new buildings when finished, with caretaker's house, &c., will amount to £7,000, exclusive of the gymnasium. The cost of furnishing has been about £1,800 in addition. The cost of the site was £2,000 and about £1,300 has been spent in removal of old cottages, &c. This amount has been raised by Urban Council loan, grants from the County Council, Mr. Carr's gift and other public subscriptions, &c., but a deficit of about £2,000 still remains to be raised.

New Government Buildings.—The House of Commons voted the following amounts last Thursday:—£53,000 for miscellaneous legal buildings; £16,000 for expenditure in respect of science and art buildings; £24,000 for constructing a new harbour and refuge at Peterhead; £456,403 for rates and contributions in lieu of rates in respect of Government property, &c.; and £202,685 for expenses of erection, repairs and maintenance of public buildings in Ireland, and for other purposes.

PARIS EXHIBITION.

HEATING AND VENTILATING SECTION.

By OSWALD WHEELER, A.M.I.M.E.

THE section of the great French and International show relating to Heating and Ventilating Appliances is more of interest to observers of national customs and ideas than of service to those who wish to see what their rivals are doing. It is not worth a special journey, though it should not be missed by the engineer who goes to see Paris and its wonderful fair.

The stands of practically all the French firms of heating and ventilating engineers who exhibit are in a separate building—"Chauffage et Ventilation"—on the riverside, near to the Alma Bridge, on the opposite bank of the river to "Old Paris." In the adjoining building of "Hygiene" is the Cordier ventilating fire-grate, perhaps the only genuine heating and ventilating appliance in the section. It should be a good one for French wood fires, but is unsuited to our bituminous coal. The flames play slightly on and the hot gases pass between a row of vertical but somewhat sloping forward pipes about 1½ inches in diameter, inside which the air passes up to a long air box at the stove top, parallel with the hearth. From the ends of this box the air enters the room by shuttered grilles. A very similar design was, and we believe is still, made in the United States, and a few were brought to England; however, they were much too powerful for our climate and our fuel, though they may serve well in the north of Scotland, where peat and wood fires are still fairly usual. The casting of the grate is well worth the notice of the practical ironfounder, and attention should be given to the method of sweeping the chimney.

The "Chauffage et Ventilation" building mentioned above contains apparatus for heating water for domestic and industrial purposes, as well as apparatus for heating buildings. Practically all the French exhibits are in this building. Some of the potters—sanitary and otherwise—have porcelain and faïence stoves and chimney-piece grates, but being clay-workers, and not engineers, their articles are shown in the Pottery section on the Quai d'Orsay. The exhibits of other nations are found in the space allotted to each in the "Decoration et Mobilier" section—decoration and furnishing of public buildings and dwellings—on the Esplanade des Invalides. Here the German, Austrian, &c., equivalents of our Waring, Heal, Howard, Johnson and Appleyard, &c., show suites of furniture in rooms, and the heating appliances (ventilating ones are very scarce) are usually the stove or grate which the national custom demands. Some of the German grates are copies of English ones, and in looking at all these continental appliances one must be careful to accept nothing as the article considered by the maker to be the best, in being the most scientific, with all the latest improvements. In the German section certainly the appliance is more likely to be in accordance with the latest arrival of the passing phases of "Art," and in all cases must the balance be weighed between the claims of reason and fancy, sustained practice and unproved theory. The exhibits of Messrs. Boyle, Blackman, Musgrave, and Lumby, Son and Wood are all close to each other on the upper floor, not very far from the Great Hall (Salle des Fêtes) on the Champ de Mars; the catalogue is not clear, but squares 4 and 5 on Plan V. will nearly locate them. Doulton's and Jennings' stands are close by. The radiators of the Swiss firm Sulzer are on the ground floor, near to the entrance to the Swiss Village. Some of the smaller nations have put the articles in the national pavilions on the riverside. The American exhibits are not all together, but many of the best are on the upper floor, close to the English and Irish firms abovementioned.

The catalogue is made on a system that everyone does not at first drop into. The stands are not numbered, as is usual in an English exhibition, and the catalogue list does not agree with the rotation of the stands. The catalogue mark is "Groupe XII., classes 66 à 75." The names of the exhibitors are arranged in alphabetical order, and as you walk round and notice some article you find its official description under the name of the firm exhibiting it. Each country has its own list of exhibitors, and the countries also are in alphabetical order in French. First on the list come France, of course; then the French colonies Algeria and Tunis, their islands in the West Indies and Pacific, and then other nations in the following order: Germany, Austria, Belgium, Spain, United States, ourselves—Grande Bretagne, including Canada, Australia, and all our Colonies. A series of maps of the Exposition grounds are on the first few pages of the catalogue, and these maps are divided into squares, marked A, B, C, &c., across the page, and 1, 2, 3, &c., down the page. In the list at the right hand side of the name and entry is the number of the map and the letter and number of the square in which the stand may be found; thus, PL. 1.—D. 3. The letters PAV. mean that the article will be found in the pavilion of the nation of the exhibitor. The cataloguing is not always accurate, especially in the foreign lists, for the catalogue seems to have been printed before the articles were in their places: those arriving too late were crowded out of the assigned quarter, and had to be put wherever room offered. The French lists are reliable. The maps also have printed on them Gr. XII., &c, and Cl. 74, &c., on the buildings which contain the respective groups and classes.

The French exhibit, taken as a whole, shows that in that country, just as in our own, low-pressure steam is the coming, in fact we may say the crowned, king in popular favour. The French engineers are fond of gill surface, either cast-iron gills encircling wrought-iron pipes, as shown by Messrs. Grouvelle and Arquembourg, of Paris, or of cast iron throughout, as made by the same firm and several others. This firm says the expansion will not break the gills, and that the results are highly satisfactory. In the main one concludes that the French are rather behind us in this matter, and it may be expected that extended experience will show them, as it has shown us, that gills can easily be overdone, and that plain pipe surface gives the highest efficiency for the longest period of time. The boilers and fittings for low-pressure steam seem to be all right; some fittings seem too light to be durable, though this is doubtless due to the difference between the national ideas of form and shape. The Paris Gas Company has a fine stand at one end of the building, but the virtue of the majority of the articles ends with their good looks, for their use will tend to increase the revenue of the company more than the comfort of the buyer. Gas appliances for heating various things seem to be popular in Paris, and the geysers are worth examining. Coils are not approved of, long straight pipes being used. Some geysers supply either hot or cold water from the same tap, by means of double passages. Geysers and steam kettles are found on several stands.

There are several absurdities and monstrosities of course. The Société de Chauffage Hygienique show a gas-heated steam boiler, whose steam is carried by pipes to tall thin iron tubs of water heated by this steam; no doubt they will soon find that results quite as good and much more economical are to be had by heating the water direct, or by using steam direct. There are also stoves for burning coke or charcoal whose winding passages and gills and fins will soon become so choked with dust that they will not work. In fact, one must never forget that the waste that Nature seems to have made necessary and unavoidable in all the imitation appliances designed by man is just as delusive as it is plain to see, and thus tempts men to try to obtain the impossible. And in looking at the French appliances we must remember that in their large towns separate houses are rare, and flats the regular and standard domicile.

The Godin stand of Colin et Cie should certainly be seen by every ironfounder and metal enameller: it is the largest and best collection of enamelled ironware that the writer has ever seen. The firm make baths and stoves for the English market, and report good business with stoves. The baths are enamelled white, although those for themselves are of a French grey tint, a pure self enamel and much more durable than the mixture that makes the white that is demanded here in England.

Mechanical ventilators are represented by the radial pressure fans of Farcot in the "Chauffage et Ventilation" building, and by the screw-bladed fan of the Société Industrielle de Creil in the machinery section near the electric plant on the Champ de Mars, not far from the Salle des Fêtes and the wine exhibits. Both are very good. The Creil is the only screw fan in the Exposition; its blades are correctly formed, and in this and several other points is ahead of all rivals. Farcot fans are also at work in the Agriculture Section, but they are not numerous enough to give first-class results in so huge a building.

The continental articles are scattered all over the place, in the pavilions of their respective nations, in the "Mobilier and Decoration" and in the "Industries Diverses" sections. The stoves are always good-looking, and may usually be taken as highly finished articles of the standard national style.

The English and Irish articles (there are no Scottish) are placed on the upper floor of the enormous building on the Champ de Mars. They are not far from the "Education et Enseignement," which we would call the schools, nursing and hospital departments. Many of the American stands are here too, and the combined show, despite the atrocious nickel ornament on the American cooking stoves, compares well enough with the French show on the riverside. Messrs. Lumby, Son and Wood have a fine stand of boilers that well sustain the reputation of their native land. Messrs. Hartley and Sugden have a rather larger show in a little building of their own, with coloured leaded glass window panels, outside the Great Britain annexe on the Esplanade des Invalides, Plan No. 1, square F.3. Messrs. Boyle, the redoubtable champions of natural ventilation, are, perhaps ironically, placed side by side with the Blackman Ventilating Company, who are equally in earnest and successful with mechanical ventilation. The Boyle articles are well got up and finished, but the Blackman stand is larger and shows a portion of a drying-room. Messrs. Musgrave have a nicely-arranged stand of well-finished stoves, and evidently have a large French connection. They also show a basement air heater or calorifer with a fan for blowing the air over it, as applied to a school in the south of Wales. The fan is not a true screw, and could certainly be improved on, and one would think the calorifer could also.

The American stands adjoining are all interesting: the one most worthy of attention is that of the J. L. Mott Ironworks, of New York. The radiators are of good appearance, easy to keep dusted and clean, have a simple but very good joint. The boilers, too, are good for hot water at least, though British people may doubt the suitability of some of them for steam. The Magee Furnace Company shows a combined hot air and water generator.

The chief American section (that on the Esplanade des Invalides) is all ventilated by small screw fans with four brass blades, driven by electric motors. Each one stands on a bracket on the partitions between the stands, and propel the air diagonally along the causeways. They keep the place very pleasant and cool and are a good example of successful mechanical ventilation.

Our Colonies' exhibits are behind the white building of Algiers, under the Trocadero, on the left as one looks across the river to the Tour Eiffel. In the "Chauffage et Ventilation" catalogue our Colonies have no separate list—they are indexed under "Grande Bretagne."

There are eighteen books of catalogues, at 3f. each. No. 14 is the volume for heating and ventilation, and also for woodwork, furniture, wall decorations and tapestry, faïence, tiles and glazed bricks. If you cannot speak French, write, or, better still, print, on a piece of paper, "Catalogue Général Officiel, Tome XIV.," and present it to the young woman at one of the numerous tables or kiosks where catalogues, views and souvenirs are sold. She will hand it to you in return for the money.

There is no need to fear being overcharged, fo the French are certainly honest.

The benches and garden seats in the Exposition grounds are all free, just as on the Boulevards, but the chairs must be paid for. The Exposition is divided into four quarters, and a chair ticket is available for the day in its own quarter only. However, the price is only 1d., and 4d. a day for a seat anywhere is very cheap.

THE HOUSING QUESTION.

IMPORTANT CONFERENCE OF THE SANITARY INSTITUTE.

A LARGELY attended and thoroughly representative conference on the Housing of the Working Classes was held on Monday and Tuesday in last week in the lecture hall of the Royal Medical and Chirurgical Society, Hanover Square. The conference was convened by the Council of the Sanitary Institute and was attended by delegates from local authorities in all parts of the country. According to the programme the discussion on the first day was to deal with "Unhealthy Areas and Displacement of Town Population," and on the second day with "Improved Houses for Town Dwellers" and "Improved Means of Communication," but, as a matter of fact, the speakers for the most part seemed to discuss any aspect of the housing problem that appealed to them, and the special question of means of communication was hardly touched on at all.

The Chairman's Address.

The chair on the first day was occupied by Mr. R. Melville Beachcroft, L.C.C., who, in opening the proceedings, expressed a hope that the question of the housing of the poor would be recognised as a non-party one. Speaking of the work done by the London County Council, he admitted that their great Boundary Street Improvement, which involved the displacement of 5,400 persons and the substitution of a model colony of municipal dwellings for 15 acres of dirty hovels, was an event which not only invited but demanded criticism. For a time it was believed that the results achieved were not such as to justify a repetition of clearances on a similar scale, but a year or two ago other large areas, namely—one in Somers Town and another in Clare Market—were initiated, and were now in course of being dealt with, whilst quite lately three new schemes had been adopted, involving further large displacements, so that additional heavy calls upon the ratepayer in the same direction might be immediately looked for. Whatever conclusion might ultimately be arrived at, it might perhaps be taken as satisfactory that the net cost of the clearances effected so far by the L.C.C. compares favourably per head with that incurred by the Metropolitan Board of Works. The latter carried out 20 clearance schemes, displacing 25,217 persons at a net cost of £59 per head, while the cost per head of clearances effected by the Council under the Housing Act works out at about £50 a head. The difference might fairly, he thought, be attributed to the special compensation provisions of the Housing Act of 1890—in fact, the Council's valuer had more than once stated that the effect of those provisions was to make it anything but a profitable transaction to own slum property required under the Housing Act.

Buying Out Trade Interests.

On the other hand, every large clearance by the London County Council must involve the buying out not only of the slum owners but of trade interests, and it was this which caused the loss to the ratepayer. The commercial value of land in the central districts when cleared was always largely in excess of its value as a site restricted to the erection of dwellings. For example, the sites on which the existing dwellings of the Council had been erected by them stood in their books at a total value of £95,000, while the commercial value was estimated by their valuer at £230,000; the difference between these two figures represented the cost which had to be borne by the ates. The question whether the present method of dealing with unhealthy areas was the best one was not, however, a purely financial one, but largely depended on the effect it had on the overcrowding difficulty. The question put by Lord Rosebery, "What is to be done with the residuum which you displace?" had still to be answered. It was easy to pass a resolution, as the County Council did a few months ago, that in future they would find accommodation for a number equal to those they displace, but not so easy to avoid displacement until new accommodation was provided; the crux lay in providing accommodation for those displaced who ought to be accommodated on the spot before the actual displacement; and, in his opinion, no clearance scheme should be allowed to pass which failed to make this provision. These persons belonged naturally to the poorest class, and in the new buildings hitherto provided the rents were too high for them and the restrictions too great. As overcrowding was the cause of an area becoming insanitary, it followed that a strict application of the law against overcrowding ought, in at all events the great majority of cases, to effect the required cure. If an area was found actually unfit for human habitation, instead of buying it up the local authority should be able to insist that the houses on it should cease to be occupied until the area had been reconstructed. The owners would then be driven to find the means of reconstruction themselves, and the only duty, condemnation once made effectual, that would then devolve upon the local authority would be to see that accommodation was found for those displaced whose business necessitated residence on the spot. Experience showed that a very small proportion of those living on an insanitary area actually needed to live on the spot (out of 6,000 disturbed in connection with the new street from Holborn to the Strand only 774 belonged to the class whose work rendered residence on the spot a necessity), and the Borough Councils, who would now have the same power that the London County Council had of providing dwellings under Part III. of the Housing Act, ought to be able, with the knowledge at their disposal, to meet the wants of these.

Enforcing Existing Laws.

He noticed with pleasure the recent circular of the Local Government Board reminding local authorities generally of the very large powers they possessed for securing the proper sanitary condition of all premises within the area under their control; and, although recent decisions might go to prove that amendment of some kind of Part II., as well as of Part III., of the Housing Act was required, the fact remained that if the existing law against overcrowding were but rigorously enforced not only would there be no unhealthy areas to deal with, but a stop would be put to the influx of population, and rents would go down. So far as the metropolis was concerned, the danger ahead of them was not so much how to deal with unhealthy areas within their border, as how to prevent them from being created just outside that border. It was high time that both the London Building Act and the Public Health (London) Act, 1891, were made applicable to districts within, say, ten miles of London and other populous towns.

Mr. T. BLASHILL pointed out the difficulty of arriving at any satisfactory solution of the housing problem in London so long as a great clearance scheme could cost £50 per head of the population displaced. As an alternative to this costly method he advocated a scheme for compelling owners of areas pronounced insanitary to form themselves into a syndicate, and for casting the onus and cost of clearance upon them. This scheme could, he contended, be carried out at a cost of less than £11 10s. per head to the public authorities.

The Housing Act of 1890.

Mr. W. HOLDER, of the Hull Corporation, made some suggestions for improving the action of Part II. of the Housing of the Working Classes Act, 1890. His Corporation looked upon Part I. of this Act as cumbersome and costly, and preferred to carry on its cleansing and reforming work by the simpler and more reasonable machinery provided under Part II. Last year they pulled down 96 houses in Hull. An amendment of the Act they found desirable was that when once the first action for closing of an insanitary dwelling is adopted no evasion of the subsequent demolition order shall be permitted if the premises cannot be made sanitarily safe as a dwelling house. They in Hull were much hampered by legal gentlemen advising their clients that they can avoid a closing order by converting what was a dwelling house into a stable, office, or warehouse. An obstructive owner could then prevent an entire renewal by placing a stable in the middle of a number of demolished houses. In many places slum properties existed in the best neighbourhoods and business centres. The enforced demolition of the whole benefited the owners, because in the place of the rookery the area was entirely denuded of its foulness, and it became opened out for the better class of properties and erections, and yet this might all be upset by the action of one owner converting an old, decrepit slum house in the centre of this plot into a stable. This should not be permissible. Another amendment would be the enlarging of the definition of "dwelling house:" when it was defined as "any inhabited building" the restriction enabled an unlet dwelling house to stand as a menace to the respectability and renewal of neighbouring houses.

Homes for the Very Poor.

Mr. J. DOUGLASS MATTHEWS, F.R.I.B.A., read a paper and exhibited plans designed to show the practicability of providing the very poor with healthy dwellings at low rents, without loss to the community. The plans showed three classes of tenements: No. 1, a one-room apartment with bed recess, to be let at 2s. 6d. per week; No. 2, a living room with parents' bed-room and cubicle for a child, and also scullery, to be let at 4s. per week; No. 3, a living-room with parents' bed-room, two cubicles for children, also scullery and detached W.C., to be let at 5s. 6d. per week. Each of the suites opens direct from the landing of a fireproof staircase—in the centre of the building—and is fitted with a ventilated food cupboard, dresser, coal store and sink which also serves the purpose of a lavatory. The chief feature in the plans is that each tenement is self-contained, and the sleeping places open out of the living room. The parents' bed room is sufficiently large for all practical purposes, and is enclosed the full height of the room. The cubicles are large enough for sleeping and dressing, and the enclosure next the room is only 6ft. 6in. high, thereby allowing cross ventilation. As the fireplace in the living room would be constantly in use, the chimney would be a valuable extractor of foul air. The buildings are designed in height and space to accord with the London Building Act, so that every portion will be amply lighted, and good play yards are provided in the rear. The requirements of the Public Health Act are also respected. The method of construction is of the simplest character, at the same time being substantial, and provision is made to guard against the rough usage of the probable tenants and to minimise constant repairs.

These dwellings, Mr. Matthews maintained, could be erected at a price which would give a return of 7 per cent. on the capital. The scheme required, however, that the public authority should purchase sites in close proximity to the centres of trade, and let them on building leases for sixty years, at a ground rent equal to that which would be given for working-class dwellings in the suburbs, say 5s. per foot frontage (£7,000 per acre); further, that the public authority should advance to the lessee, at 3 per cent., and that the inhabited house duty should be remitted.

There were many other speakers, including Dr. Sykes (St. Pancras), Mr. Cooper (Aberdeen), Mr. Godbold (West Ham), Mrs. M. Dockrill (Dublin), the Lord Provost of Glasgow, who spoke of the difficulties of adopting the Housing of the Working Classes Act in Glasgow, Mr. Alderman F. Lupton (Leeds), who explained the Leeds procedure of buying land for housing and re-selling it on stringent conditions, Mr. Harper (Cardiff), who inveighed against the Local Government Board

and its ways, and Mr. Alderman Purcell (Liverpool).

Mr. Anderson (Liverpool) moved and Mr. Smith (St. Pancras) seconded a resolution declaring that the present method of dealing with insanitary areas was extravagant and unsatisfactory and suggesting that Parliament should provide some inexpensive tribunal on the spot for deciding what areas were insanitary and enabling local authorities to proceed at once to deal with them. After some discussion, an amendment moved by Mr. H. M. Close (St. Pancras) and seconded by Mr. Holder (Hull) was agreed to in the following terms:—"This conference is of opinion that the present method of dealing with insanitary areas is extravagant and unsatisfactory, and urges Parliament to provide some less expensive and more expeditious mode of procedure."

In the afternoon the members visited the L.C.C. dwellings at Millbank, Westminster, and on the Boundary Street area.

An Animated Discussion.

At the second day's Conference Sir Sydney H. Waterlow presided. The room was crowded, and the proceedings were animated throughout. Towards the close of the three hours' discussion Dr. Wynter Blyth, who occupied the chair for the latter part of the meeting, imposed a five minutes limit upon the speakers, but in spite of this time could not be found for all who wished to address the Conference. Sir Sydney Waterlow devoted his opening address chiefly to an account of the work done by the company of which he has been chairman for thirty-seven years. They had spent a million and a quarter of money in the erection of 5,600 tenements, occupied by nearly 30,000 persons. The first four blocks, built in 1862, each contained 70 rooms, and cost £42 per room. There had been a gradual increase in the cost until this year it reached £75 per room; the increase was mainly due, Sir Sydney thought, to the fact that more money had to be paid to the workmen for shorter hours and less work. The outgoings in the shape of rates had also greatly increased. There could be no doubt that the heavy increase at each quinquennial assessment deterred capitalists from promoting new building companies. At the present time the average rent charged by his company was 2s. 3d. per room per week, but in the newest buildings they had to charge 3s. per room, and the rooms had all been readily taken up at that price.

Dwellings Outside London.

Speaking of the Act passed this Session enabling the London County Council to erect working-class dwellings "outside their district," Sir Sydney Waterlow expressed the opinion that such a scheme would not accomplish the result anticipated by some. The cost of the dwellings would be as great as, if not greater than, in London, and the time spent on the railway or in the tramcars would be a serious loss. The cost of living would be higher, and in his opinion it was not good policy to separate the weekly wage class from the more wealthy parts of the community. The Government should be more liberal with reference to the charge they made for money advanced on mortgage by the Public Works Loan Commissioners. The plan upon which he had always acted was to attempt in the first place to meet the wants of that portion of the working class who are earning from 25s. to £2 per week. As the pressure of this class in finding decent homes was lightened, and better accommodation provided for their use, the class immediately beneath them would shift into the quarters they vacated, and this would be repeated until the lowest of all, those who were least likely to appreciate decent homes, would slowly but surely receive their share of the benefits enjoyed by those above them. Improved dwellings for the working classes meant a reduction of death-rate: in the dwellings erected by his own company the death-rate in 1899 was 11·5 in the thousand, as compared with 19·8, the average death-rate in the County of London. The loss of rent was very small indeed; the class they were trying to help were worthy of being helped, and it would be a good thing if many more companies could be started with the same objects, for what one company can do may be done by another company.

The Kind of Dwelling Needed.

Mr. H. Percy Boulnois, who was unable to be present, sent a communication which was printed and distributed to the members. Dealing with the question of the best kind of dwelling to be erected for the poorer labouring classes, Mr. Boulnois maintained that most of the dwellings hitherto erected had been too elaborate and too expensive in rental to attract those for whom provision was really required. The accommodation must be simple and even unattractive, or otherwise a better class tenant would be attracted; the rent aimed at should, if possible, approach some such unit as one shilling per room per week. Could this be done under existing circumstances without taxing the more fortunate or harder working members of a community? It certainly would not if the price of land exceeded a certain limit, but he believed it could be done with land of the value of about 15s. per square yard.

The building might be either of the "block" type, or preferably rows of self-contained cottages, two or three storeys in height, with two- or three-roomed tenements. The rooms must not be too large or lodgers would be introduced, there need be no larder, as this class of tenant had veritably to live "from hand to mouth." There need be no copper for washing, as what little fuel was bought was used for cooking and washing might now be done at the nearest public washhouse. The living room might be the kitchen and there should be a small scullery fitted with a sink and cold water tap. There was no need for a hot water tap, as this meant a boiler and extra fuel. Any hot water required would be heated in a kettle or pot on the sitting room range, which should, of course, have a small oven and hot plate. Each tenement should, if possible, have a separate W.C. All the plumbing must be the best possible, but no lead must be used, and everything must be strong and unbreakable. The buildings should be of plain but good brick. There was no necessity for plaster on the inner walls; with good brickwork a bright colour wash was all that was required. The floors should be of concrete, with grooved and tongued floor boards or pitched joints, and absolutely impervious. There should be as little woodwork as possible, and the doors should be thick "ledged" doors not easily broken. The windows should have very small panes of glass so that repairs might be very cheap, but they must be large and easily opened for light and air. All stairs, window heads, door sills, and any "dressings" should be of concrete. Only in this direction of cheapening construction could the problem be solved.

Mr. Whitmore (Hackney) spoke of the unfairness of landlords raising their rents immediately after each quinquennial assessment, and reducing them just before the next assessment, so as to save rates; also of raising rents when they were compelled by sanitary authorities to execute repairs. Such practices should be made illegal. He advocated the establishment of some authority to fix the rent of all property of less than £40 a year, and also an enactment to enable local authorities to borrow money repayable over a period of a hundred years. These drastic proposals Mr. Whitmore wished to embody in a series of resolutions, which were duly seconded by Mr. Thomas Adams, of Plumstead. It was evident, however, that the Conference generally was not in sympathy with these views, or the way in which they were put forward, and the "previous question" was moved and carried. From the dangerous paths of political wrangling the Conference was recalled by a most admirable and practical address by Alderman Thompson, of Richmond.

What Richmond Has Done.

Alderman Thompson explained what had been done at Richmond in the building of workmen's cottages by municipal effort. But he thought the right principle was not to rule out any form of enterprise, municipal or private, which aimed at relieving the house famine by providing more and cheaper houses for the working classes. There was practically a "corner" in building land on the outskirts of London, and this ought to be broken down. If you could compel owners to sell land for building at reasonable prices, others would come into the market and there would be a general reduction in prices. The land now was let out a little at a time and fancy prices were paid. If they could get 10,000 acres at £500 an acre they could house a million people quite cheaply. Land should be in the hands of the local authorities empowered to lease it to private individuals or companies who were willing to put up sanitary houses. In great cities it was only possible to erect block dwellings, but at Richmond they had been building six-roomed cottages which let at 7s. 9d. a week, and allowed a good margin of profit with land at £1,000 per acre, paying London prices for materials and wages. Alderman Thompson proceeded to speak with some indignation of the Local Government Board, which issued an insulting circular asking local authorities to do their duty, and at the same time put all manner of obstacles in their way. Some of the regulations of the Board were very absurd and unnecessary: they said that if you put a third bedroom in a cottage you must have a 14in. wall to carry it, but a 9in. wall was quite sufficient. If they could borrow money at 2½ per cent. for 60 years for the building and 100 years for the land they could let their houses at 1s. per room per week, which should be regarded as a standard price. He concluded by moving: "(1) That in the opinion of this Conference the Local Government Board should at once extend the period of repayment actually granted to local authorities for building loans under Part III. of the Housing of the Working Classes Act, 1890, to the full statutory period of 60 years, and that they should relax and vary the restrictions on building cottages, especially in the direction of enabling more rooms to be provided at a less cost per room where this can be done without prejudice to considerations of sanitation and safety; and (2) that Parliament should be asked to extend the period for repayment of housing loans to 100 years in the case of land and to facilitate the advance of money by the Public Works Loans Commissioners at the market rate of interest for the purpose of housing the working classes."

The L.C.C. Architect.

Mr. W. E. Riley (superintending architect of the London County Council) followed with some criticisms of the various working-class dwellings illustrated at the Paris Exhibition and some details about the work carried out by the L.C.C. Cheapness of building, he said, was essential in dwellings of this class, but he strongly urged the desirability of giving the best internal finish possible, so that everything might be sound and sanitary. Then, if money allowed, it might be spent on adorning the exteriors, but that should be quite a secondary consideration. In designing workmen's dwellings they needed a fixed minimum standard; then everyone should try and do better in each case. Mr. Riley exhibited and explained various plans and gave some particulars as to cost. The average return on the housing operations of the London County Council was 3½ per cent.

A Private Company's Work.

Mr. E. Bond, M.P. (Chairman of the East End Dwellings Company), gave an account of the experience of his company in providing dwellings for a class rather left out by other companies and by the London County Council, viz. people who did not earn more than 15s. to 21s. a week. It was no use putting up buildings unless they were going to pay. Therefore there was no use in building model cottages delightful to the eye and pleasant to show to the ignoramus, who was apt to think a great work had been done because some cottages had been erected and let at 8s. or 10s. a week. The problem was an economic one: it was a question of wages and of rent. They had to consider what was the best accommodation that could be given to allow a reasonable return for the outlay. To the man or woman who was earning a very poor wage indeed you could only give a poor house. You could not put up houses that did not yield a return on the money

borrowed. The great difficulty in London was not so much the cost of land as the rise in rates of wages and the prices of building materials. When his company began their enterprise the cost was £50 to £60 per room, now it was £70 to £80. Local Government Board restrictions—some of which were wise, though others were needlessly stringent—and the increase in rates were other difficulties. He thought the problem was best faced by private enterprise; but whether by private or by public enterprise they must make up their minds to allow people to live in single-room tenements and to dispense with ornament, making the buildings as sightly as possible by means of coloured bricks. It was impossible to supply a self-contained tenement at rents the people could pay. The experience of his company was that they could not let their rooms at less than 3s. 6d. per room.

Municipal Dwellings in West Ham.

Councillor TERRETT, of West Ham, gave an outline of the work that is being done by the West Ham Corporation. With a rapidly increasing population and rates at 9s. in the pound they had great difficulties to face, but they had tackled the housing question and were now committed to a scheme for housing 1,200 families. In the matter of cost they did better than the London County Council, which had to pay 8¾d. to 10d. per foot cube for its Millwall dwellings. The West Ham Corporation built double tenements consisting of three rooms and a scullery downstairs and a similar tenement upstairs, with separate entrances from the front and back, at a cost of 6¾d. per foot cube for the first 20 and 7d. for the last 34. They built by direct labour, paying as much or more than London Trade Union rates and using the very best material. The tenements were lighted by electricity in each room, and for this the tenants paid 6d. per week. They were now building 90 more dwellings and putting a bath in the scullery; the cost would work out at about 6¾d. per foot cube, and the average rental would be 2s. to 2s. 2d. per room, not including the scullery. These tenements consisted of four rooms and a scullery upstairs and three rooms and a scullery downstairs, and they hoped to get about 8s. for the upper flats and 7s. for the lower ones. The rooms were large, the front room downstairs measuring 15ft. by 11ft. 6in., and one of the bedrooms 9ft. by 12ft.

Mr. C. J. HAIR, A.R.I.B.A., urged the importance of providing new dwellings before destroying the old. Municipal bodies tried to please everybody and make their schemes pay, but they could not do it. He related his experience in the erection of model dwellings at Southampton, frankly warning the Conference against some of the mistakes that had been made in connection with that scheme.

A Lincolnshire Eldorado.

Mr. W. E. HARRIS delighted the meeting with a racy account of what he and others had accomplished in Lincolnshire. They bought freehold land and built on it at a cost of £30 per room, the tenant becoming his own freeholder by paying monthly instalments. This, Mr. Harris explained, was "none of your Jabez Balfour business," and the prospect he unfolded was such a rosy one that a member of the Conference was led to ask what was the single fare to Lincolnshire. The meeting was in a somewhat hilarious mood by this time, but it listened with respectful attention to Mrs. DOCKRILL'S earnest plea for the poorest class, who were often overlooked in these housing schemes.

Mr. A. B. MCDONALD, the city engineer of Glasgow, gave a few details about Glasgow tenements, the cost of building which did not exceed 4¾d. or 5d. per foot cube.

Mr. G. BERNARD SHAW (St. Pancras) contested Mr. Bond's dictum that a scheme which did not yield a monetary profit was an unfruitful one. In view of the vice and crime and disease resulting from overcrowding, the provision of healthy homes was a wise expenditure of public money.

Dr. COLLINS, L.C.C., pointed out that local authorities were bound by the Local Government Board and the Home Office and the methods of these authorities varied from time to time. The housing question was a sanitary one. It was not for Dives to leave Lazarus at his gate covered with sores, or Lazarus might spread pestilence, which knows no geographical limits and laughs at Local Government Board regulations.

Mr. ISAAC YOUNG, of Battersea, discussed the question from a sanitary inspector's point of view, and Mr. A. M. FOWLER, of Manchester, whose argument was cut short by the operation of the five minutes limit, was understood to defend the system of back-to-back houses widely adopted in Leeds.

Dr. CHALMERS (Glasgow) called attention to the case of an almost forgotten class—those who would not go into the model dwellings, the thriftless and indifferent who would not comply with any standard of discipline. How to deal with these was a problem still unsolved.

The resolutions proposed by Alderman THOMPSON, to which several amendments were proposed and in turn rejected, were then put to the meeting and carried. A suggestion to extend the sitting was rejected, and the Conference closed with votes of thanks to Sir Sydney Waterlow and Dr. Wynter Blyth.

In the afternoon a visit was paid to Richmond, where the delegates inspected the dwellings erected by the Town Council and were afterwards entertained at tea by the Mayor. Most of the delegates also availed themselves of the opportunity afforded by the Sanitary Institute of inspecting an interesting collection of plans and models bearing upon the subject of the Conference, which were displayed at the Parkes Museum, Margaret Street, W.

PERMANENCE OF PIGMENTS.

FOR a period of from three hundred to four hundred years white lead has been the mainstay of the painter for the preparation of his paints, and notwithstanding the introduction of such pigments as barytes, zinc white, Charlton white, lithopone, patent white leads, &c., it still retains, says the "Decorative Gazette," its foremost position, and there are many painters who refuse to use any of the substitutes which are put on the market from time to time and puffed up on the strength, perhaps, of a chemist's laboratory tests. It is not claimed that white lead is a perfect pigment, but, so far, experience has shown that it is superior to anything else in regard to permanence. The question in regard to the use of white pigments, as regards the permanence of paint made with them, is how long does it take to test it in this respect—one month, one year, two years, or any number of years? The advocates and manufacturers of new white pigments make their tests on a small scale and over a comparatively short period of time, and perhaps finding them then to be good proceed to puff them up as permanent. But it is just possible that the conditions under which the experiments were conducted are not those to which the article will be subjected in actual practice. A paint has to stand for five, six or eight years, or often longer, the action of the weather, sun, rain, sleet, hail, frost, wind, fog, and so on. Experimental tests can hardly be carried on for such a period of time that the paint can be exposed to these influences for a sufficiently long time, and therefore the scepticism of the laboratory tests by the painter is not to be wondered at. A paint applied to a house might look well for four years, and it would be pronounced permanent; another twelve months' exposure sees, however, the formation of cracks, and when the house wants repainting this old paint has to be burnt off. A case has been known where a house has been painted with a mixture of barytes and zinc white. After some years it still appeared good, and it was given a coat of white lead, and this was repeated two or three times; then, at the end of twenty years, the paint began to crack and leave the wood. Evidently the barytes and zinc paint would not last twenty years, although one hears many encomiums as to the great permanence of such a combination. Zinc white has been described as a permanent paint material. Well, it may be for inside work, but let it be used for outside work. It will stand for four or five years and look well. Put another coat on, and again after another five years it also looks well. Put another coat on, and now, perhaps, the effect of time begins to tell, and the paint begins to crack and chip and leave the wood. Evidently a test extending over ten years is not enough to test the durability of zinc white. How is it with white lead? Well, cases might be cited of places painted and repainted with genuine white lead and good linseed oil for a period of over one hundred years, and the paint is as good to-day as could be wished. It is this circumstance that induces painters to pin their faith to white lead and to look askance on the short-lived tests of the many substitutes which have been brought out during the past twenty-five to fifty years. The accumulated experience of a hundred years is not to be placed against that of only perhaps ten years.

Correspondence.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

KENDAL.

SIR,—I am taking a great interest in the correspondence going on in your valuable journal on the subject of Architects' Assistants' Salaries. I agree with "Hopeful" that it is, to a certain extent, the fault of the assistants themselves that they are underpaid. I do not agree with "Junior" that an assistant just out of his articles could not get 25s. to 30s. a week, but would have to take 20s. to 23s. All pupils in the office in which I am are started with a salary of 30s. a week when out of their time. Three or four who have left our office since I went have all of them got situations at 30s. to 35s. a week, although they were not turned 22 years of age. I agree with "Vigilans" that there should be a society formed to raise the standard of assistants' salaries. By this means assistants would have some grounds on which to base their charges.—Yours, &c.,

INTERESTED.

To the Editor of THE BUILDERS' JOURNAL.

ST. ALBANS.

SIR,—I have followed the opinions on the above subject in your valuable paper with great interest, and feel bound to take exception to the view expressed by "An Art Worker." To commence with, he quotes an isolated case, and furthermore has the effrontery to compare our salaries with those of "ordinary clerks in business establishments!"

Surely, in view of our long and expensive training, and the fact that we are members—however humble—of a worthy profession, this is indeed the "comparison odious." Our work is most highly skilled, embracing as it does an infinity of subjects, and I have yet to learn that any special ability and training are necessary to become an "ordinary clerk."

It would be far more to the point to have the views of the "young fellow" himself upon the adequacy of his salary.

I shall be most pleased to render to "Vigilans" any assistance in my power towards his practical scheme.—Yours, &c., REFORM.

The Mining Department of the Yorkshire College is in need of more accommodation. It is proposed to erect a building for the special use of the department. There is a suitable site in connection with recently acquired land in College Road, which the Council of the College are prepared to assign for the purpose. It is suggested that the building should be of three storeys. On the ground floor, according to the provisional sketch plans prepared by Messrs. A. Waterhouse and Son, the architects to the College, there will be an assaying laboratory, the professor's private room a balance room and a small research laboratory; on the floor above a lecture room, a diagram room and a preparation room, and on the top floor a museum. These plans, however, are subject to modification. It is estimated that £4,000 will be required to cover the cost of the building and its equipment, and the Mining Committee has decided to appeal to those interested in mining for subscriptions.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Party Wall.

EALING, W.—X. Y. Z. writes: "I am proposing to make some additions to a house in London, which involves rebuilding a party fence wall as a party wall. I have served notices under the London Building Act, 1894, upon the adjoining owner and occupier. The former has consented to the alterations, but the latter will not consent, and refuses to appoint a surveyor to represent him as provided by the above Act. He says Sec. 91 does not apply to the adjoining *occupier*. Can you tell me if he is right in this, and, if so, what is my remedy?"

The word "owner" in the 91st sec. includes a person in occupation otherwise than (1) as a tenant from year to year, (2) for any less term, or (3) as a tenant at will. If the adjoining occupier holds in any of these three ways he is not an "owner," and is not bound to appoint a surveyor: otherwise he is, and if he makes default for 10 days after service of the notice X. Y. Z. may appoint one in his place. If the adjoining occupier is not an "owner," X. Y. Z. can proceed without any reference to him.

H. P. B.

Architects' Remuneration.

HALIFAX.—FAIRATION writes: "I thank H. B. P. for the trouble taken in trying to answer my questions in your issues for July 11th and 25th. It pleases me to find the replies given, so far as they go, favour my position in reference to the use and allowance for old materials. I am only sorry that I have not apparently made my queries sufficiently clear for him to grasp the awkward position I am placed in by my clients attempting to cut down payment. I took the work to carry out according to the services stated by Clause A in extracts from account sent herewith, my clients accepting same, subject to payment on amount of outlay. The commencement of operations was delayed for a considerable time between the tenders being received and actual works commenced. Additions arose as per Clauses B and C in office account, payments of which are not demurred to, except less cost of old materials refused. In carrying out the foregoing work, old buildings on the site had to be measured and particulars got in detail of materials which might be available for incorporation in the new erections, thereby saving the expenditure of money that would have had to be incurred for new materials in their absence, and handicapping myself in specifying their use, as it is much easier to have a free hand in describing entirely new work than to be encumbered by an incongruous mass of old materials arising from demolished buildings. Extra labour was thus incurred and more pains were required to be taken in detailing old materials for re-using, which only tended to reduce the commission to the architect. Consequently, if the value of old materials are not chargeable for remuneration, some payment should be forthcoming for services involved in enabling contractors to allow for same in estimating, and the clients saving thereby in actual money out of pocket in building new erections. H. B. P. says that the note appended to my original query increases the confusion, as it would seem from it that the old materials, or some of them, consist of work not taken down, but allowed to remain so as to form part of the completed building. It was far from my intention to convey such an idea, and in letting several professional friends read the note they understood it in the light I wished to convey, viz: Old work taken down and the materials re-usable in new erection. The contractor was stopped when the new erections were only part done, and I was called upon to measure him off and make out a statement as to work executed and value of materials on the ground at the time of stoppage, I stating that this was a service not contemplated in sending in terms and should be allowed for; but the legal adviser says this was necessary to be done, to show how the contractor stood, the querist stating that the work could have been completed without getting out a statement, and if there was anything in hand at completion of work it could have been handed over to contractor or his representatives. In any case it is only fair the services rendered should be paid for, being over those contemplated, and might have been called upon to be carried out by an independent surveyor. As far as the schedule for professional practice and charges of architects are concerned, if they are not law, they ought to be available, as showing morally that an architect ought not to be called upon to do all kinds of additional services not originally contemplated without receiving reasonable payment for same. The contractor died and trouble arose with his creditors in winding up the contract, certain matters having nearly gone to arbitration, yet I am informed that neither for the extra services connected with foregoing, nor if I had had to attend an arbitration, would there have been any renumeration due to me: so it would seem that all sorts of services and labour can be piled upon an architect without any redress so long as the employers simply state in accepting terms that the same are approved subject to paying an outlay. Measuring off extras and deductions, as required in this case, are usually allowed for, and half commission paid for latter, seeing plans and specifications were prepared and tenders got in, and additional drawings necessitated in carrying them out, which, if not allowed for, proves a dead loss and money out of pocket to the architect, as well as an incentive to make deductions as small as possible, seeing his commission is lessened thereby. Measuring up works in London and many large towns is carried out by the quantity surveyor as a separate business and charged to employers independent of architect's renumeration.

"The following are the extracts from office account: — *Clause* (A): *Terms.* — Making survey and taking levels of present premises and surroundings, as well as plotting and making plans with levels denoted thereon, showing same prior to commencing new work; getting out preliminary and contract plans, sections and elevations, also draft and fair copied specifications for the several trades, together with a set of duplicates of foregoing for the guidance of clerk of works and contractors in carrying out the new works, as well as superintending the carrying out of same to completion, including visiting contractors' workshops; preparation of detail and working drawings, ascertaining amounts due and certifying cash on account; interviews and correspondence, as well as attendances upon committee; preparation of quantities for the different trades, obtaining particulars and getting out builders' accounts, — per cent. on £—. (B) Ditto, ditto, in taking down and rebuilding old erection. (C) Ditto, ditto, on additional work incurred in increased accommodation. (D) Measuring off extras and deductions and getting out accounts."

We can only refer our correspondent to our previous answers. He undertook to do certain work on the terms that he should be remunerated by a percentage on the outlay. We have told him what, in our opinion, is the meaning of "outlay" in this particular case. For that work he can get no more than the agreed-on percentage. If he has done other work, not included in the contract under which he became entitled to that percentage, he can claim payment for it.

H. P. B.

Colouring Parchment.

CREDITON.—J. E. B. writes: "How can plans prepared on parchment be coloured so as to get an even tint?"

Before colour is applied to plans on parchment the surface of the parchment should be rubbed over with pounce, which is a white powder, and the colour should be mixed with ox-gall. Both materials can be obtained at an artists' colourman's shop. It is impossible to get the colour absolutely even, and the enquirer may have to go over the work again and again to get a satisfactory depth in tone. Walls are best blacked in in ink.

E. D.

Terms.

DUDLEY.—A STUDENT writes: "Will you kindly tell me the meaning of the following terms in the building trade which I have come across in my reading:—(1) Double-faced moulded skirting; (2) Stone Lime—what is the difference between this and other lime? (3) 'Stubbing'; (4) Steining to wells; (5) Fletton Bricks."

(1) We are unacquainted with the term, which we are inclined to think is incorrectly stated. A double moulded skirting consists of two or more members. (2) "Stone" lime is a London nickname for grey chalk lime, obtained in the south of England from the lower chalk beds, principally from Sussex, Surrey, Hampshire, &c. It is a fat lime, good for use in mortar, but feebly hydraulic. (3) It depends in what connection "stubbing" occurs, but a common meaning for "stubbing" is "grubbing up." (4) Steining to wells means the lining of brickwork, ironwork, &c., to a dug well. (5) "Fletton" bricks are now a well known variety coming from various firms at Fletton Siding, Peterborough. Our correspondent will learn that bricks from various districts sometimes acquire a reputation for certain qualities, and are then called by their place of origin. "Fareham" reds and "Staffordshire" blues are instances.

Cornice.

MANCHESTER.—ANXIOUS writes: "I should be pleased to have your opinion of the brick cornice shown on the sketch enclosed (not reproduced), which is the gable of a villa residence. Should the lines of chimney shafts continue unbroken through the cornice or the cornice be continued through the chimney shaft."

We see no reason for the employment of a cornice here, and therefore advise our correspondent not to use one. The application of cornices has become one of precedent without understanding. In this case, however, the needful line of shade can be obtained by extending the eaves over or the cornice might be replaced by a very flat band of ornament stopped against the chimney shaft. Constructional lines should always be emphasised rather than weakened.

Haig-Brown Memorial at Charterhouse.—A memorial bronze statue of the Rev. Dr. Haig-Brown, for many years Master of Charterhouse, has been erected outside the chapel at Charterhouse School, Godalming. The execution of the memorial was placed in the hands of Mr. Harry Bates, who, however, died before he had completed his task, and it was finished by his pupil, Mr. Henry Poole, under the supervision of Mr. Onslow Ford. Dr. Haig-Brown is represented as seated and wearing his gown. In his right hand is a rough model of the school chapel, an indication of the fact that he was the founder of the new buildings.

No. 17 Fleet Street.—At last week's meeting of the London County Council the General Purposes Committee reported that in regard to No. 17 Fleet Street, commonly known as Wolsey's Palace, which the Council has agreed to purchase and restore at a cost of £27,300, the freeholder was now claiming £21,349 as the amount of the purchase money instead of £20 000, the difference being stated to be the amount of the vendor's expenses and liabilities paid or incurred in pulling down the back and side walls and rebuilding a portion of the party walls, as well as the surveyor's and architect's fees. Having carefully considered the matter the committee recommended that the vendor's solicitors should be informed that the Council was not prepared to authorise the expenditure of a larger sum in the purchase and restoration of No. 17 Fleet Street than that agreed upon in April last. After some discussion, in which several members spoke strongly against such a high price being given for the building, the recommendation was adopted.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*Remember, therefore, and write it on the very tables of your heart, that you must never, when you have to judge of character in national styles, regard them in the decadence, but always in their spring and youth.*"—JOHN RUSKIN.

The Decoration of St. Paul's. THE following letter, signed by Messrs. J. M. Brydon, John Belcher, A.R.A., John F. Bentley, W. D. Caröe, Edward W. Mountford, Thomas E. Collcutt, Mervyn Macartney, Ernest George, Edward S. Prior, Ernest Newton, J. Oldrid Scott, Leonard Stokes, A. Sugelow, James Brooks, E. R. Robson, Alexander Graham, Basil Champneys and J. J. Stevenson, has been addressed to the Dean of St. Paul's:—"Dear Sir,—Interest in the progress of the works at St. Paul's remains unabated, and it will be a source of satisfaction to all admirers of Wren to find that some portions of the stencilling and some of the wooden rosettes which are attached to the stonework have been removed from beneath the dome. We venture to express the hope that the experiments now in hand will result in the cessation of work which, in our opinion, is out of sympathy with the character of the building and injurious to its dignity. We would specially direct attention to the panels which have been introduced, without reference to Sir C. Wren's intentions, into the spandrels upon each side of the diagonal arches of the octagon. A new and prominent feature is also being added to the building which is open to grave question—namely, the red and gilded iron railing now being placed upon the main cornice. If a railing be necessary in this position to enable the mosaic and painted decorations to be seen we respectfully submit that it should be something extremely light, after the manner of many good examples in Italy, and that it should be devised so as to carefully abstain from affecting the proportions of the building or interfering with the design of the attic. The railing in question seems to us to have both these defects, and in this regard differs from the old railing at the west end, which not only avoids any interference with the architecture, but is a thing of beauty in itself. We trust that this new railing may be reconsidered in greater sympathy with the architectural demands and qualities of our metropolitan cathedral and, if possible, abandoned."

Art Masters. THE twelfth annual general meeting of the members of the Society of Art Masters was held last week in the Lecture Theatre of the Victoria and Albert Museum, South Kensington. The chairman, Mr. W. Wallis, in the course of his presidential address, pointed out that Parliamentary action in connection with their work had centered in the Education Bill, the further progress of which was deferred until next year in order that it might be considered during the recess. The most satisfactory feature of the Bill was the provision making it compulsory on local authorities to spend the whole of the beer money for educational purposes. But therewith arose the anxiety as to the proportions in which the money would be allocated—whether art instruction, hitherto insufficiently subsidised, was to gain or suffer. The importance of art instruction in relation to industries appeared to be most inadequately appreciated by Parliamentarians, and it was of the greatest necessity that their society should do their best to remedy such a state of things. The tendency to look upon schools of art as separate institutions was distinctly on the decline, and they were more and more becoming branches of large schools appearing under the fascinating name of technical schools. There was no want of evidence that in many places workmanship was regarded with greater favour than draughtsmanship. Lectures now appeared to be accepted as the substitute for practical instruction in art. It was essential that governing bodies should include experts and that art masters should have entire control over their departments in order to check retrograde modern tendencies. The report of the council and the statement of accounts having been unanimously adopted, Mr. Shelley was elected chairman for the ensuing year and Mr. Stevenson vice-chairman.

Covent Garden Theatre. IT is proposed to considerably alter and improve Covent Garden Theatre before the next season. Mr. Edwin O. Sachs is the architect, and the alterations are estimated to cost £15,000. The whole of the stage is now being cleared away. The scenery will in future be pulled up and down by electric motive power. The scene dock is being lowered to the street level, while the roof of the stage is being raised 20ft. Formerly one opera only a day could be set, whereas scenery for three operas will next season be hung there, balanced by weights, so as to be easily pulled up or down. The centre of the stage will be one enormous platform, divided into four parts, each worked by electric motors. The new stage will be quite flat, the "rake," of which managers were at one time so proud, being hopelessly old-fashioned. By touching an electric button scenery can be raised without folding; the wardrobe will all be handy on the stage level, and electric elevators will bring "properties" from the rooms above. The electric light also will be entirely rearranged. Important alterations will likewise be made in the auditorium. The side stall entrances will be abolished, and two more pit-boxes will thus be formed. The central entrance and "Fops' Alley" will be retained, and there will be two new exits beneath the pit-boxes on either side of the proscenium. The proscenium itself will be abolished. Lastly, a new asbestos curtain will prevent any danger of fire between stage and auditorium.

Celtic Gold Ornaments. A SUMMARY, prepared by the Treasury, of facts and correspondence with respect to certain Celtic ornaments found in 1896 at Limavady, in the north-west of Ireland, has been issued as a Parliamentary paper. It states that the gold ornaments in question had been found in 1896 by a farm labourer whilst ploughing the lands of Mr. Gibson, near Limavady. They passed into the hands of Mr. Gribbon, a jeweller, of Belfast, by whom they were sold to Mr. Day, a collector of antiquities and a member of the Royal Irish Academy, who sold them in 1897 to the Trustees of the British Museum for £600. In answer to a question in the House of Commons on March 29, 1898, the Attorney-General for Ireland stated that on the facts, so far as he had been able to ascertain them, these articles were, in his opinion, treasure trove and belonged to the Crown. Ultimately a committee was appointed by a Treasury minute, dated October 24, 1898, to investigate the matter, and, in answer to an opinion of the Irish law officers that the ornaments were *primâ facie* treasure trove and the Trustees were bound to give them up to the Crown if required to do so, the Trustees contended that the ornaments had been found in a field which, until the last 60 years, formed part of the bed of the sea; that in these circumstances the articles could not have been hidden with a view to their recovery; and that they are not, therefore, treasure trove within Blackstone's definition of that term. On February 2, 1900, Sir R. Webster, Mr. Atkinson and Sir R. Finlay gave the joint opinion that the question whether the ornaments were treasure trove or not was a question of fact, depending on whether they were originally hidden or merely lost, but even if the evidence before the committee of enquiry was established treasure trove ought to be found in this case; that assuming the ornaments were treasure trove they could be recovered from the Trustees of the British Museum, and that they were not prepared to give an opinion as to whether the Trustees would have any remedy against Mr. Day. With regard to certain additional information which had been obtained as to the place in which the ornaments were found and the circumstances of the discovery the law officers of the two countries gave the following further joint opinion on March 20:—"Upon the facts now stated being established we are of opinion that the articles in question should be adjudged to belong to the Crown as treasure trove." This further opinion was, on May 17, forwarded by the Treasury for the consideration of the Trustees of the British Museum. Sir E. Maunde Thompson, replying, on May 31, on behalf of the Trustees, said they were bound to hold possession of the objects unless the claim of the Crown to them as treasure trove should be legally established. Even if the claim of the Crown to the ornaments as treasure trove should be established it should be a matter for grave consideration whether the rights of the Crown should be exercised by the removal of the ornaments from the national museum of the United Kingdom. The Treasury, on June 15 last, instructed their solicitor to take steps to obtain a judicial decision on the question whether the ornaments are treasure trove.

The New Great Seal. THE reasons for making a new Great Seal within the past year are simply that the wear and tear of the old one, which was engraved in 1878, have superannuated it, and the task was entrusted to Mr. de Saulles, the Mint engraver. The designs were approved by the Queen, and have now been modelled. The seal on its "principal" side represents the Queen seated on her throne, the arms of which are supported by lions. Her Majesty is crowned, vested in a richly-embroidered robe and habited in the royal ornaments with the ribbon and star of the Order of the Garter. In her right hand she holds the sceptre, her left reposes on the arm of the throne. At her feet is an ornamented cushion embroidered with the rose, shamrock, and thistle, placed on a footstool. The throne is adorned with a wreath of laurel confined by a ribbon. On the Queen's right is a figure of St. George, fully armed, and bearing a lance with pennon. On her left stands St. Michael resting on his sheathed sword. The panels supporting these figures bear respectively the sword and scales of Justice surrounded by laurel leaves. The Counter-Seal represents the Queen crowned, mounted on her palfrey, and in the royal mantle. In her right hand she holds the sceptre, in her left the orb. In the field to the right are the royal arms on a shield encircled by the Order of the Garter with its motto. Above is a scroll with the words "Dieu et Mon Droit," and on either side the rose, shamrock and thistle. Below, in the distance, is the sea, with an ironclad and a sailing vessel, suggesting the naval strength and trade of the United Kingdom, which are further indicated at the base by the presence of a trident, dolphins and conventional waves, which are continued in the ornament on either side the lower part of the Counter-Seal. The general treatment is Renaissance.

The Start of the Housing Question. THE housing question, as far at least as the Metropolis is concerned, is, says the "London Argus," of comparatively modern growth. It was no further back than 1844 that the first practical effort was made to grapple with the problem. That year witnessed the foundation of the Society for Improving the Condition of the Working Classes, with the Queen and the late Prince Consort as its most prominent patrons. The objects of the society were very comprehensive. They were: 1st—By arranging and executing plans, as models for the improvement of the dwellings of the poor, both in the Metropolis and the manufacturing and agricultural districts; by establishing the field garden and cottage allotment system, and also friendly or benefit and loan societies upon sound principles, and reporting the results with a view to rendering them available as models for more extended adoption. 2nd—The formation of county, parochial and district associations, acting upon uniform plans and rules. 3rd—The establishment of a system of correspondence by means of which clergymen, magistrates, landed proprietors and others would be encouraged to render assistance in their own districts. Through the efforts of the society model buildings were erected in Bloomsbury, Hatton Garden, Drury Lane, and other parts of London, and in addition valuable work was done in arousing the public to the impor-

tance of an improved system of artisans' dwellings. An offshoot of the movement was the Metropolitan Association for Improving the Dwellings of the Industrial Classes, which was the first organisation to work on joint-stock lines. This body erected in St. Pancras and Spitalfields blocks of buildings which were not unworthy forerunners of the Rowton Houses of our own day.

Local Trading. Cosmopolitanism has been one of the great curses of modern architecture, and we sympathise considerably with the writer of the following letter that appeared recently in the "Sheffield Independent," but still, whatever may be said, materials cannot often be obtained so cheaply from local firms as from large Metropolitan ones, and often local work is not equal to that required. Fairplay writes:—"Allow me to ventilate a matter which is felt by a large body of citizens to be a rank injustice to many Sheffield tradesmen. Taking one of many parallel cases, it is to be regretted that there can be found in the city of Sheffield architects who specify material and fittings (which are required for the various buildings which have been and are now in progress throughout the city) to be supplied direct from firms in other towns, and in many cases actually order the goods themselves, to the great detriment of the local tradesman, thus depriving the builder, the joiner, the ironmonger and other trades of the business and profit they are entitled to. Does the architect, may I ask, pocket the profit himself, which should, in all fairness, belong to others, or why does he specify the goods must be purchased from such and such a firm in Birmingham, Wolverhampton and other towns, the same firms being enriched at the expense of the ratepayers of Sheffield? To say the least, it savours much like some secret commission business. It is to be hoped this kind of unfair dealing will be promptly checked, as it affects directly and indirectly all classes of the community. Those who find the money and those who engage architects will be doing a common duty by insisting in their terms and agreements with them that Sheffield tradesmen get fair play. Let the architects have fair play also, and stick to their profession. Sheffield tradesmen, if allowed, can supply goods equally as well and cheap as outside firms in every particular, and no idle excuse of economy that might be raised in defence can screen those who are guilty of such practices."

Housing in Liverpool. A conference of delegates from trade unions, co-operative societies, places of worship and other bodies interested in the housing problem was held recently under the auspices of the Liverpool Housing Committee. The committee has for its object the promotion of the erection by the municipality of healthy and comfortable houses for the people. The overcrowding difficulty is of long standing in Liverpool, as evidenced by a pamphlet issued in 1871 by Dr. French and the Rev. Charles Beard, in which it was stated that at least one-third of the population of the city lived in houses the arrangements of which were a menace to both morality and health. Of course a great amount of insanitary property has been demolished, but in many cases this has made things worse, because the people who inhabited the condemned dwellings are driven into crowding the immediate neighbourhoods still more. The following resolutions were carried unanimously: "This conference urges upon the Legislature to take the following steps towards simplifying the housing problem:—(1) To confer upon towns and urban district councils full powers to acquire and hold land without their boundaries. (2) To extend their borrowing powers as follows—(*a*) time for repayment of loans to be not less than 80 years for urban districts and 100 years for towns, so far as concerns the portion of the loan allocated to building, and even a longer period for that portion secured upon the sites; (*b*) disabilities contingent upon the extent of existing municipal debts to be removed; (*c*) suspension of sinking fund operations for at least three years to be allowed, or a longer period, subject to sanction of the Local Government Board; (*d*) money to be advanced by the Government at 2½ per cent. per annum. (3) To remove any restrictions as to building upon areas cleared under Parts I. or II. of the Act of 1890, or any other special or general Act. (4) To reform the incidence of local taxation so as to throw a considerable share of the cost of all improvement schemes upon urban land values. (5) To relieve rural district councils from need of any consent other than that of the Local Government Board. (6) To confer powers on all councils to compulsorily acquire land on the basis of assessable value after six months' notice to the owner, with power of appeal on the owner's part. (7) To remove medical officers of health from any other than central control."

Bleak House, Broadstairs. It was recently suggested that Bleak House, Broadstairs, an interesting relic of Charles Dickens, should be purchased by the authorities of Broadstairs and converted into a museum. It is somewhat unfortunate that the name "Bleak House" should have been bestowed upon this building, because it is in no way connected with the novel bearing that name. In an article published in the "Pall Mall Magazine," in July, 1896, Charles Dickens the younger states that not a line of "Bleak House" was written in the "tall house near the Coastguards' station, formerly known as Fort House, although a good deal of 'David Copperfield' was." The house itself is a somewhat singular-looking structure, and the exposed situation has probably dictated its name. The name "Fort House" which it originally bore seems to suggest that it stands on the site of some disused fort—even if it may not have been built out of the remains of a fort.

Reports on Competitions. Mr. Campbell Douglas, writing to the "Glasgow Herald" with reference to the Stobhill Hospital competition, says:—"I think it is a difficult thing for an architectural assessor thoroughly to master the manner in which a number of men have endeavoured to solve the problems set before them, and for future guidance in such matters I should like to make the following suggestion, viz., that in some way or other all competitors might be invited to send in criticisms of the other works, and this would form an exhaustive analysis of competitive designs, such as it has never yet been the good fortune—so far as I know—of any promoters to have had within their reach; and our employers—the public—would reap as much benefit as the profession from this suggestion being entertained; and I do not think the difficulties to be overcome would be insuperable."

New Barrack Accommodation. It is stated that the War Office has decided upon an important and extensive scheme for providing additional barrack accommodation for the British Army on the home station. It is stated that it has been determined to keep the Army at its present strength for some time to come. It is, therefore, intended to provide additional quarters for the auxiliary forces. The programme, so far as it refers to the Western military district, is that new barracks are to be built on the Brickfields at Devonport, and another on the War Office ground adjoining the barracks at Crownhill, about two miles from Plymouth, on the Tavistock Road. The new buildings will consist of hutments similar to, but of much more substantial character than, those at Aldershot, and each barracks will comprise about sixty distinct buildings, including four for officers and thirty-two for non-commissioned officers and men, besides married quarters, recreation rooms, canteens, &c. It is also understood that the War Office authorities contemplate the provision of other quarters in the Plymouth district for a brigade division of Royal Field Artillery, which will necessitate the erection of between sixty and seventy hutments. The new barracks at Devonport and Crownhill are to be commenced at once, and finished by the first week in November.

Professional Practice.

Bristol.—At the last meeting of the general committee for the restoration of Bristol Cathedral, Archdeacon Robeson brought forward a report he had drawn up in conjunction with the Rev. W. Mann and Mr. F. Richardson Cross, the hon. secretaries, dealing with the progress of the restoration. The report stated that at the public meeting which inaugurated the work on June 13th, 1892, the requirements brought before the meeting, and for the accomplishment of which the generous support of the citizens of Bristol was solicited, were as follows:—I. Restoration of the central tower and Elder Lady Chapel. II. The internal rearrangement and fittings of the choir, including (1) The reconstruction of the stalls; (2) Marble flooring and steps; (3) Altar table and communion rails; (4) Reredos; (5) Choir screen; (6) Side screens; (7) Bishop's throne. III. Lighting of the Cathedral. IV. The provision of a new organ. Most of these works had now been executed, and they had contributed greatly both to the permanent solidity of the Cathedral fabric and to the seemliness and dignity of the interior. But as the work of restoration proceeded the extremely dilapidated and even precarious state of the more ancient portions of the external structure, especially on the southern and eastern sides of the choir was forced upon the attention of the committee and of the Dean and Chapter, and they decided to make no further general appeal to the citizens for the completion of the remainder of the interior fittings (such as the reredos with sedilia, the Bishop's throne, the choir screen and the organ) until they could assure them that the building itself was in a sound and substantial condition, worthy of the Cathedral of a great city. This view of the matter was placed before a second public meeting on March 4th, 1896, and the efforts of the Restoration Committee since that time have been directed towards this object. Those efforts were materially assisted by a third meeting on June 29th, 1899. The work has been carried out under the guidance of the late Mr. Pearson by Messrs. Cowlin. Wherever the original stonework was in a sound condition it is stated to have been carefully and religiously preserved. During the progress of the work just described, but independently of the Restoration Committee, a costly reredos has been erected. The committee suggest that the sedilia, the completion of the choir screen, the Bishop's throne, a more dignified pulpit, and an organ more suited to modern requirements may well be the objects of private gifts, or be offered as memorials of distinguished citizens or benefactors of the Cathedral. The total sum contributed amounts to £19,331 17s. 10d. Of this, £13,152 4s. 6d. has been paid to the builders, Messrs. Cowlin and Son. Their work includes the following items:—Restoration of central tower, £4,895 17s. 3d.; Elder Lady Chapel, £1,866 12s. 5d.; northern side of cloisters, £712; and the entire restoration of the exterior fabric of the choir, choir aisles, Berkeley and Newton Chapels and south transepts, with roofs, parapets, pinnacles, &c., £4,490. The reconstruction of the stalls cost £1,407 10s.; the marble flooring and steps, £1,367 15s.; and other internal improvements, £1,125 14s.

Brynmawr.—The new parish church of St. Mary, Brynmawr, was consecrated recently. The former structure, consecrated in 1872, did not long withstand the climatic vagaries of this exposed neighbourhood, for Mr. T. Nicholson, architect, Hereford, in September, 1891, concludes his lengthy report as to its state and condition with the remark:—"Wretched in design, slight and flimsy as a building, beggarly in aspect, this church comes not within the category of structures worthy of restoration; and far gone as it is in general dilapidation and decay, its reparation would be a wasteful expenditure of money, and hopeless would be the task of converting it into a sound and satisfactory state." Steps were taken with the view of rebuilding, and last year the Bishop laid the foundation stone of the new church, which has been built by Mr. J. Jenkins, of Brynmawr, under the

superintendence and from designs prepared by Messrs. Nicholson and Hartree, of Hereford. The first design for the new church was made in 1891, and plans and specifications were prepared, but for various reasons the work was delayed. Ultimately these plans were abandoned, being considered too costly, and in October, 1895, the plans for the present building were prepared. The old church, which consisted of a nave, chancel, west porch, and north lobby, was pulled down to make way for the present structure. The style of the new church is of the Decorated Period, at the end of the 13th and beginning of the 14th centuries. It consists of a nave at present 60ft. long and 25ft. wide, with north and south nave aisles of similar length and 10ft. 8in. wide, all capable of future western extension. An organ chamber is placed on the north side, and a vestry and porch on the south side of the chancel, also a temporary porch on the south side of the nave. The general walling is built of native stone from the Gilwern quarries (the north and south aisles with such stone from the old church as could be utilised), arranged externally as hammer-dressed random-ranged work, the internal treatment being similar, but of a smoother and finer description. The present temporary west wall of the nave and aisles is built of 14in. brickwork, having three of the windows from the old church inserted in it, and owing to its exposed position slate is hung on the outside. The roofs are constructed of wrought open timber framed work, the construction visible internally, boarded over on the upper side of the rafters then overlaid with felt and covered with Bangor slates, the chancel roof, in addition, having moulded ribs, cornice and curved braces. Over the whole area of the building is spread a thick layer of concrete, and thereon laid in the chancel and nave and aisle gangways encaustic tiles from Messrs. Godwin and Hewitt's Victoria Tile Works, Hereford, and under the spaces occupied by the sittings in red deal block flooring. The nave is seated with the benches preserved from the old church, altered and adapted, and the aisles filled with chairs. A large 4-light tracery window occupies the east end of the chancel, and the nave aisle is lighted by 2-light windows, all the windows above the springing of the heads being filled with tracery. A sedilia, credence and piscina are placed in the south wall of the chancel. The pulpit was purchased from the vicar and churchwardens of Sutton, Surrey, and the font from Messrs. Jones and Willis. The future enlargement of the church will comprise the extension of the nave and aisles 17ft. towards the west and the building of the south porch.

Cardiff.—The corner-stones of two new branch libraries for Roath and Grangetown have just been laid. The site of the new building at Grangetown is situated at the junction of Clive Street and Redlaver Street. It will have accommodation for 150 readers and 7,000 volumes in the lending department. The building, which has been designed by Mr. E. M. Bruce-Vaughan, F.R.I.B.A., whose plans were adjudicated to be the best of those received in open competition, will cost £2,750, of which sum £625 has been spent in preparing the foundations. The site itself cost £520. The building is being erected by Messrs. D. Thomas and Sons, contractors. The site of the new library at Roath is at the junction of Four Elms Lane and Newport Road. The building, which is being erected from the competitive designs of Messrs. Teather and Wilson, architects, Cardiff, is placed upon the triangular site in such a way that the wider portion would be retained for future extension. Storage room will be provided for 7,000 volumes, and this can be extended, if found necessary, to shelve 12,000 volumes. There will be accommodation for 200 readers.

Chester.—Mr. Justice Grantham and a special jury recently heard at Chester Assizes an action brought by John Macnamara, architect, Altrincham, to recover certain fees and damages for libel from John Henderson Brown, retired Manchester cotton spinner, residing at Riverside Hall, Altrincham. Mr. Brown is a man of considerable wealth, and on retiring from business he decided to invest, so it was stated, about £30,000 in land and buildings. He commissioned plaintiff to buy land at Altrincham and prepare plans and quantities for the erection of a new Altrincham Post Office and several shops. During the erection of the post office a rupture took place between the parties in consequence of the plaintiff using Accrington bricks where defendant had stipulated for Ruabon bricks, and Mr. Brown summarily dismissed plaintiff. In a letter to a third party the defendant complained that Mr. Macnamara had not treated him fairly, and reflected on his ability as an architect. The jury awarded plaintiff £1,474 for architect's fees and work done and £250 for libel.

Dewsbury.—New premises of the London and Yorkshire Banking Company, Limited, were opened recently, at the junction of Northgate and Corporation Street. Mr. J. Lane Fox, of Bond Street, Dewsbury, is the architect. The premises consist of a banking room, 34ft. by 31ft.; manager's room, 12ft. by 12ft.; fireproof strong room, 10ft. by 12ft., on the ground floor. The whole of the basement is set apart for storage purposes, and is lined with white glazed bricks. The entrance is situated at the junction of Corporation Street and Northgate, the doors being of oak, studded with brass. On the first and second floors there are eight offices, with the requisite lavatories and w.c.'s on each floor. The upper floor contains caretaker's rooms, including living room and two bedrooms. The ground floor is in grey granite from the Aberdeen quarries, the upper storeys being in Holmfirth dressed ashlar with bands of granite. Offices on the upper floor will be let off and known as Bank Chambers, and are reached from a separate entrance from Corporation Street.

Ipswich.—Extensive alterations and improvements are being made to the Tacket Street Congregational Church, Ipswich, the principal addition being named "Langston Hall," in memory of the first pastor. Some small cottages in Cox Lane have been pulled down, thus providing an admirable site of about 12 rods for the new Langston Hall. With respect to the present chapel, the proposal is to take down the part of the gallery now used for the choir, and to place the organ—which was built in the gallery—on the ground floor. The pulpit will be set back about 6ft., and the choir will be seated on either side on the ground floor. The organ, which has already been taken down, is to be enlarged by Messrs. Bishop and Sons. On the site of the building which stood at the rear of the chapel a church parlour, minister's and deacons' vestries, a kitchen and other buildings are to be erected. The church parlour will be 32ft. 6in. long by 24ft. wide, with a recess at one end—raised two steps higher than the main floor level—5ft. deep and 14ft. wide, the approach to the new building being direct from the ground floor. It will be fitted up for holding small meetings, and for carrying on the work of the various organisations connected with the church. The heating chamber is to be considerably improved, a large vault discovered at the back being utilised for the purpose. Externally the church parlour will be constructed in Bath stone dressings and Kentish rag facings to match the existing building. The architects are Messrs. Eade and Johns and the builder is Mr. Fred. Bennett, Ipswich.

Liverpool.—A sitting of the Liverpool Consistory Court was held last week before Chancellor Espin. The most interesting business was the granting of a faculty for the restoration or rebuilding of St. Saviour's, Falkner Square, Liverpool, after the recent fire. All but the outer walls were destroyed by the fire. The plans produced by Messrs. Willink and Thicknesse, architects, showed that while it was proposed to retain the classic style of the old building great improvements and embellishment would be introduced. The restored church would have the chancel and entrance, with baptistery, reversed, another departure from the old structure being the abandonment of the gallery. Thus in the restored church the entrance would be from the west end. There were about 4,000 people in the parish, and the proposed seating for 700 would be sufficient. The estimated cost was £9,500, of which nearly £8,000 had been already raised, the insurance, including the organ, being for £4,800. The Chancellor thought the experience here fortified his injunction in favour of insurance, and yet he had met with a church destroyed by fire which was not insured though it had cost over £12,000. The faculty was decreed in the terms of the citation.—The Rev. G. W. Wall, vicar, was granted a faculty for the placing of stained glass in a three-light window of the north aisle at the cost of Mr. J. Gallagher, J.P., in memory of his two infant daughters.—The Rev. M. F. B. Binney, vicar of St. Nicholas', Sutton, near St. Helens, was granted a faculty for the erection of an oak and tiled lych gate, at a cost of £300, by the vicar's wife, in memory of her parents; and for placing stained glass in two windows, at a cost of £100, in memory of William Blinkhorn, of Sutton Grange, by his widow and daughter.

London.—The Wood Street neighbourhood will shortly be provided with adequate fire protection, in contrast to what has been the case for a long time past. The successive disastrous fires in the district, and finally the Cripplegate conflagration, forced home the importance of erecting a fire station in the area, and in consequence of the representations made to them the Fire Brigade authorities a year or so ago definitely grappled with the matter by acquiring from the trustees the freehold site of Lady Holles School in Redcross Street, E.C., at a cost of £31,000. Upon this site a station, intended to take the place of the one in Whitecross Street, is now in course of erection. It is anticipated that the new building will be ready for occupation by November next. The site has an area of about 4,660ft. super, with a frontage of 90ft. The architect's estimate for the building was £12,062, but on its becoming necessary to erect the building as soon as possible the Works Department of the London County Council produced an estimate of £627 in excess of that amount, and it was decided to build on the latter estimate instead of inviting tenders. The new station will be built to the first floor level of Portland stone with granite plinth, and above the first floor level of red brickwork. The engine room will be 33ft. by 47ft., and will be lined with glazed bricks. It will contain standing room for a horsed escape, a steam-engine and a hose cart ready for immediate use, and the chief run out will be exactly opposite Jewin Street. The stabling for six horses will be at the rear of the engine room, with a "run in" central with the horsed escape. Through and top ventilation will be used and the room will be well lighted. The watch room will have a floor area of 180ft., and the recreation room an area of about 400ft. super. The staircase over will lead into the engine room, and the lift will be in the staircase well. A well-fitted laundry, a battery room, 14 coal cellars, a large cellar for the station officer, a workshop, an oil store, storage of wood and a cellar for steam coal will be in the basement, but the space beneath the steam-engine and the horsed escape will be solid to prevent the horses from being frightened at the hollow sound usually experienced with basements. The first floor will contain officers' quarters, quarters for coachmen, and a common bath room; while the other floors will provide excellent accommodation for the men, with two common bath rooms, &c.; and the roof over the stables will form a drying ground and playground. The building, which will be lighted throughout by electricity, is being built under the direction of the superintending architect to the L.C.C., Mr. W. E. Riley.

Prestatyn.—The new public hall for the seaside town of Prestatyn was opened recently. The building is conveniently situated in High Street, about a hundred yards from the station, and the façade includes several shops, with rooms over them which are intended for the Liberal Club. A tower 40ft. high surmounts the entrance to the hall, a wide vestibule leading by two doorways into the floor of the hall and by a short staircase to a gallery constructed over about one-third of the floor space. By means of what may be termed "aisles" the

floor space is considerably increased, and the clerestory is supported by two arches and is pierced by three windows on each side. The platform is partly within an arched recess, the exits from it to the ante-rooms being ingeniously concealed behind the wall from which the arch springs. Ample and convenient ante-rooms are provided, there being communication between all of them and the stage. Provision is also made for the use of the building for dinners, tea parties, &c. The hall is well lighted and ventilated, and may be heated by a high-pressure hot-water apparatus. It will seat about 800 persons. Mr. Thomas Jones was the designer and builder.

Stockport.—The Stockport Guardians have adopted the report of a special committee on the proposed new infirmary. The following resolutions were adopted by the board, viz.:—1. That the new infirmary be erected upon the northern side of the site at Stepping Hill. 2. That the buildings consist of a central administrative block, containing the necessary offices, with residential quarters for the medical officer, steward, matron, and the general staff, also kitchen, stores, boilerhouse, &c., sufficiently large for an infirmary of ultimately about 500 beds. That two double pavilion blocks—one on each side of the central or administrative block and connected therewith by a central corridor—be erected; the block for males to accommodate about 156 beds and that for females and children to accommodate about 166 beds. That a separate block (30 beds) be erected as a home for the nursing staff, and that in addition porter's lodge, receiving wards, patients' clothes stores and mortuary be erected. 3. That the buildings be lighted by electricity. 4. That a communication be addressed to the Local Government Board asking for their general approval of the scheme proposed by the committee. 5. That upon receipt of the Local Government Board's general approval the board invite competitive plans for the erection of an infirmary of the size and description indicated at a cost not exceeding £130 per bed; and that in submitting designs the architects be requested to adhere as far as possible to the recommendations contained in the committee's report. The committee, in accordance with the instructions of the board, submit the names of the following six architects who should be invited to submit competitive designs, viz.:—Messrs. Mangnall and Littlewood, Manchester; Mr. W. H. Ward, Birmingham; Messrs. W. and Segar Owen, Warrington (architects Warrington Union Infirmary); Mr. Arthur Marshall, Nottingham (architect Wolverhampton Workhouse, Nottingham Workhouse); Messrs. Giles, Gough and Trollope, London (architects Bethnal Green Infirmary, Central London Sick Asylum Hospitals, &c.); Messrs. Newcombe, Morton and Knowles, Newcastle-on-Tyne (architects Gateshead Workhouse).

Tullibody, Clackmannan.—A new public hall for meetings and social gatherings is to be erected for Tullibody and Cambus. It is intended to include in the building a reading room, library, and recreation room. The hall will be erected on a convenient site at the head of the Cambus Road leading to Tullibody. It will have accommodation for 250 persons. A small wing at the rear of the extreme north-west corner will contain well fitted up retiring rooms for ladies and gentlemen, besides a lobby and separate entrances to the platform. The cloakrooms, with lavatories adjoining, are to be placed on either side of the entrance hall, while the reading and recreation rooms will enter from the corridor off the main entrance. The large hall will be heated by hot-water pipes and the other rooms by open fire-grates. It is estimated that the erection of the building will cost about £1,400. The architect is Mr. G. A. Kerr, of Mar Street, Alloa.

Whitechapel.—The refuse destructor erected by the Whitechapel District Board of Works in Wentworth Street was opened last Thursday and the foundation stone of an electricity supply station laid. Hitherto there has been a temporary electric station, and the installation has only sufficed for partial public lighting. The new building will meet demands for electricity, not only for increased public lighting but for private illumination and motor purposes. Altogether £100,000 has been borrowed to cover the cost of present buildings and future extensions. The refuse destructor has been built by Messrs. Manlove, Alliott and Co., Nottingham, under the supervision of Mr. M. W. Jameson, engineer to the Whitechapel Board, who is also designer of the electric supply station. It has been constructed on the most approved modern principles, and will not really cost the ratepayers a penny. This happy result is worked out by valuing the steam supplied its neighbour at £3,125 a year. Coal, based upon present prices, would doubtless make the figure much higher. Then there are the residuals useful for road-making and builders. The destructor consists of twelve cells, each of which is guaranteed to consume not less than 10 tons of refuse every 24 hours. The heat thus produced is to be used to work six boilers, each evaporating not less than 2,000lb. of water an hour, and the steam obtained is to be employed in driving the electric lighting machinery. The destructor, however, does not afford all the steam that is required, hence eight Babcock and Wilcox boilers are also to be installed. The electrical equipment is by Messrs. Mather and Platt.

Winchester.—William Burrough Hill, architect, High Street, Southampton, recently sued George Ayling Barnard, architect, of Winchester, for £8 8s. 8d., the balance of fees due for professional services rendered as a witness in a recent action. For the plaintiff it was stated that the action was the outcome of a case heard in Winchester, in which, after three days' hearing, His Honour gave judgment for the present defendant. The claim was against a Mr. Hutchens for an architect's bill, and carried with it costs on the £20 scale. Mr. Hill was the chief witness called on Mr. Barnard's behalf, and had to rebut the evidence of two other architects. Mr. Hill now claimed at the rate of 5 guineas per day and 3 guineas for a qualifying fee, which Mr. Barnard contested. Offers had been made to submit the matter to any architect Mr. Barnard might select, but that gentleman had declined. Mr. Hill, in his evidence, stated that for expert evidence of the kind he was accustomed to receive 10 guineas per day. There were a lot of accounts and plans to be dealt with in the action. Defendant had telegraphed asking him if he would accept half the fees in the event of the action being lost, and he had refused. Defendant stated that in the action he recovered £37. Mr. Hill's charges were £19 18s. 6d., which he considered excessive. Three guineas a day was quite sufficient for the work he did. His Honour, in giving judgment, said that he had never heard of such a disgraceful attempt to get rid of liability which had been incurred. He, as the Judge who tried the case, felt it right to say from the Bench—and he thought it ought to be said in justice to Mr. Burrough Hill—that until Mr. Hill's evidence was given in court he (the Judge) was very much prejudiced against the then plaintiff in that action. If it had not been for the high standard of Mr. Burrough Hill, and the opinion he was able to give of the difficulties and details of those plans, he (the Judge) would have most materially cut down Mr. Barnard's claim in the action, and he would have got considerably under £10. After correspondence and interviews, for Mr. Barnard to dispute the claim of Mr. Burrough Hill was inconceivable, and he regretted very much to see such a step taken by any gentleman who put himself forward as being in the profession of an architect. He believed that the defendant was not a member of the Institute of Surveyors, and therefore he was glad that it did not reflect in any way on the Institute. The plaintiff had shown a praiseworthy reluctance in bringing the case into court, and defendant had evidently relied on Mr. Burrough Hill's disinclination to come into court and, putting it vulgarly, wash the dirty linen. Judgment entered for plaintiff, with costs.

The Rebuilding of Mafeking Church.—Mr. Francis R. T. Balfour, Canon of Bloemfontein, calls for contributions for this worthy purpose. The rectory was destroyed during the siege, and the church seriously damaged.

Surveying and Sanitary Notes.

Letting Infected Houses.—Taking houses or lodgings for holiday purposes being very general just now the "Law Times" directs attention to the very stringent statutory provisions which have been made for the benefit of the public and their protection against infectious diseases. It is enacted by Section 128 of the Public Health Act, 1875, that any person letting a house or room which has been occupied by any person having an infectious disorder without having the house or room properly disinfected is liable to a penalty of £20, and Section 129 of the same Act enacts that "any person letting for hire or showing for the purpose of letting for hire any house or part of a house, who, on being questioned" by any intending tenant "as to the fact of there being or having been therein for six weeks previously any person suffering from any dangerous infectious disorder, knowingly makes a false answer, shall be liable" to a similar penalty or to a month's imprisonment with hard labour. The adoptive Infectious Diseases Prevention Act, 1890, s. 7, respecting the obligation to disinfect, may also be usefully referred to by lodging-house keepers.

Vestries and Public Improvements.—The case of *Gibbon* v. *The Vestry of Paddington* came before Mr. Justice Stirling in the Chancery Division last week. In this matter the vestry sought, under powers given by Act of Parliament, to take compulsorily certain portions of four shops belonging to the plaintiff in Moscow Road, Bayswater, for the purpose of public improvement by widening the road. They duly served notice to treat upon the owner, and negotiations ensued, but the parties could not come to an agreement. Subsequently, the vestry decided only to take part of the premises, but the plaintiff objected, and contended that if they took part they were legally bound to take the whole. Mr. Justice Stirling said he was bound by previous decisions, in which it had been held that if a substantial part of the premises was taken for such a purpose, so that the portion remaining could not be used for the purpose for which it was intended, the owner might compel the vestry to take the whole. He held that in this case a substantial portion would be taken, and therefore the owner could compel the vestry to take the whole. Judgment for the plaintiff accordingly.

Death-rate in Model Dwellings. — The medical officer of health for the parish of St. Martin-in-the-Fields has recently presented to the vestry a very significant report on the sanitary condition of Turner's Court, leading off St. Martin's Lane. The court consists of eleven old houses, which accommodate no fewer than 155 persons. Light and fresh air are wellnigh excluded from the lower rooms of four of the houses by a high wall but 4ft. 3in. distant, and all the houses need constant supervision to keep them habitable. It is not surprising therefore to find that the death-rate in this court is abnormal, and the following table of death-rates is instructive:—

	Turner's Court.	Peabody Buildings.	Whole of Parish.
1895	38·7	12·3	16 5
1896	64·5	12·3	16 2
1897	83·9	17·6	15·2
1898	19 4	8 8	14·4
1899	32·3	15·8	14 1
Average for five years ..	47·8	13·4	15·3

Walthamstow's New Park.—Last Saturday week Mr. Sam Woods, M.P., formally opened the new recreation ground adjoining "The Winns" Manor House in Forest Road, where William Morris was born. The grounds cover an area of nine and a half acres, and abound in spots of sylvan beauty. There is an ornamental lake. A children's playground is to be added, fitted with a gymnasium, a gardener's lodge is in course of erection and a pavilion is being built in the cricket ground, which will

contain accommodation on the ground floor for refreshments, while dressing-rooms, bath-rooms, &c., will be provided. The house is a plain but roomy building, believed to date back to 1760, and it is intended to convert it into a technical institute or museum. Meanwhile it is to be thoroughly repaired, a verandah will be constructed along the whole length of the back of the house, one of the largest chambers will be converted into a refreshment room, another will be used as a branch library and a third as a reading room. The additional property purchased by the District Council cost £4,000 and £7,000 is being expended on the various additions and improvements. A set of public baths were also opened by Mr. Woods. The baths are situated in the High Street, and have been erected at a cost of about £15,000 upon land bought by the Council for £400 nine or ten years ago. The swimming pond is 130ft. long by 35ft. wide, and there are also eight first-class baths for men, fourteen for women, a number of second-class baths, two club-rooms, and numerous offices. In the winter the swimming bath will serve as a public hall, with accommodation for 2,000 persons.

Builders' Notes.

Housing at Birmingham.—At the last meeting of the Birmingham City Council it was decided to purchase land in Yardley Road for the erection of workmen's dwellings. It is proposed that these shall take the form of flats.

Building at Linlithgow.—The Dean of Guild Court passed the following plans last week:—Compounding shed and boiler house proposed to be erected by Nobel's Explosive Company on their property at High East Port; a billiard room proposed to be erected by Mr. McCombie of St. Michael's Hotel; cottage, proposed to be built by Mr. Meek, shoe merchant, on land bordering on the Bo'ness Road.

Collapse of Buildings in Flookburgh, Cark.—A couple of unusual accidents occurred recently. Messrs. Blair, builders, are engaged in building a storehouse, and had got to the height for the roof beam to be laid on to the wall. For some cause or other the outer wall suddenly collapsed, the beam and about 4 square yards of wall falling with a crash. About seven men were working at the time, and one or two had narrow escapes. The other case of collapse was the roof of Messrs. Butler's smithy. It was found that one of the principal ribs had given way, and the strain thus produced had broken the other beams. The great top stones and rigging fell no further than the first room.

The Death of Mr. James Binnian, of Kidderminster, occurred recently, at the age of 86. Mr. Binnian was a native of Kidderminster and the son of a Mr. William Binnian, builder and contractor, who went to Kidderminster in the early years of the present century from Wales. After leaving school he was apprenticed to the building trade. When his apprenticeship was completed Mr. Binnian spent a short time in Birmingham. More than sixty years ago he joined his father in business, the firm being known as Messrs. William Binnian and Son. Upon the death of his father Mr. Binnian carried on the business himself, and early in the "sixties" he took into partnership his son Thomas, the name of the firm being changed to James Binnian and Son. The business has been carried on in the same place in Mill Street for more than seventy years. The firm had a full share of the building work in the district, and Mr. Binnian was once elected Mayor.

Damage to a Telegraph Line.—Sheriff Reid has decided an action in Edinburgh Small Debt Court which is the first of the kind in Scotland. The Postmaster-General claimed £9 8s. 1d. from Adam Loch, contractor, Shandwick Place, Edinburgh, in respect of damage done to the telegraph line below a street in Leith, where defendant was carrying on building operations. Plaintiff alleged that the telegraph line was melted by the heat from a tar boiler which defendant was using. It was contended for the Postmaster-General that, under the Telegraph Act, Mr. Loch was liable, and authorities from the English Courts were quoted in support of the contention. On the other hand, the defendant pleaded that in respect he did not know that the telegraph line was there he should not be held liable. He had only carried out his operations in accordance with the recognised custom of his trade. Sheriff Reid held that defendant was liable, and gave a decree for the amount claimed.

Injured by a Falling Wall.—At the Birkenhead County Court, before His Honour Judge Gwynne James, John Hamilton and Eleanor Hamilton, his wife, of Birkenhead, sued George Henry Morris, of Birkenhead, for injuries received by a wall falling down. The evidence went to show that defendant was the owner of a wall abutting on Mr. and Mrs. Hamilton's premises in Holt Terrace, Birkenhead. This wall was in a very ruinous state, and threatened to fall down at some time or other, being thus dangerous to passers-by. Mr. Hamilton drew defendant's attention to the wall, and suggested that it be attended to. Defendant said that he did not want to repair it just then; he was negotiating with the Birkenhead Corporation for the sale of the wall. The climax was reached when the wall fell, and injured Mrs. Hamilton, who had to be attended by the doctor for seven weeks. His Honour, in giving judgment, said that it was time something was done to make the wall safe. He awarded £15 damages to complainants, and costs.

An Arbitration Case.—At Haverhill County Court, before His Honour Judge Bagshawe, Q.C., William George Jarvis, builder, of Clare, sued Robert Free, maltster, Mistley, for £33 13s. 1d. for work done and materials supplied. For the defendant it was stated that by agreement the parties referred the matter to arbitration. The arbitration was held by Mr. Grimwood, of Sudbury, but the defendant had no opportunity of being represented, no notice having been given him, and he applied at the Divisional Court, where an order was made setting aside the award. It was contended, however, that the agreement to refer to arbitration still stood, and defendant was quite willing that it should. The plaintiff urged that the award having been made the agreement was put an end to. His Honour thought it would be highly improper to remit the case back to the gentleman whose award had been set aside, and he suggested that a fresh arbitrator should be appointed, to be agreed upon between the parties, and this arrangement was accepted.

Case of a Board-school Wall.—At the Portsmouth County Court recently His Honour Judge Gye had before him a case in which the plaintiff was Mr. W. H. Collins, who is the occupier of a piece of land in George Street, Buckland, and he claimed £50 damages from the Portsmouth School Board, the possessors of an adjoining piece of land, for alleged wrongful interference by the erection of a wall overhanging his land, and also asked to have the wall pulled down, and for an injunction to restrain the defendants from continuing to interfere in his use and enjoyment of the land. The wall round the board school in George Street bulged and hung over the plaintiff's ground adjoining; in order to keep this wall from falling over altogether, struts were erected upon the plaintiff's land. As a result of the placing of these struts, which was done during the absence of the plaintiff, his building work was claimed to have been interfered with. The defendants contended that it was idle for the plaintiff to say that he had sustained damage. Plaintiff could have built on the land during the period in question, but did not do so simply because his men were employed on another contract. There was, it was contended, no damage upon which the plaintiff could put his finger. By October everything that the plaintiff could complain of had been remedied. The jury returned a verdict for the defendant board, and costs on the higher scale were granted.

Show-case or Structure?—At the Lambeth Police Court last week, W. H. Ricketts, a builder, of Bedford Road, Lambeth, was summoned by the London County Council for unlawfully retaining a structure to which Part 7 of the London Building Act, 1894, applied. The defendant, in the early part of last year, put up a large show-case in the forecourt of his premises. The attention of the Council was directed to the matter, and a notice was served upon the defendant under Part 7 of the London Building Act, which provides that wooden structures are not to be erected without a licence from the Council. A second notice was served upon the defendant under Part 3 of the Act, the structure being beyond the general line of frontage. The defendant then wrote to the Council saying he was not aware that such structures were not allowed by the Council, and asking them to allow it to remain for a time, to enable him to dispose of it. He called attention to the fact that the case was quite empty, and was labelled for sale. The Council replied allowing defendant two months from November 13 for the removal of the structure. Nothing more was heard of the matter until April last, when the Lambeth Vestry drew the attention of the Council to the fact that the defendant was retaining the show-case in his forecourt, and was using it for the exhibition of various builders' requisites. These proceedings were afterwards instituted. The case was 8ft. 4in. long, 6ft. 6in. wide and 10ft. high. Evidence was called on both sides, the defendant stating that the notice, "This case for sale," had been on the case all the time. It was not fixed in any way to the premises. The articles which it contained were simply stored in it. He was still trying to sell the case, which he did not require for any purpose of his own. In the result decision was given in favour of the Council, and an order made to remove the structure within 28 days. The defendant was also ordered to pay a nominal penalty of 3s. and £2 2s. costs.

Breach of By-Laws.—At Stratford, James Lees Thompson, builder, of 25 Upper Road, Plaistow, was recently summoned by the Barking Urban District Council for committing a breach of one of their by-laws which requires builders to give notice to the Council of the completion of any buildings within a reasonable time. Some of the houses built by the defendant, and numbered from 50 to 70 Cook Street, Barking, had been occupied since February 3rd, and up to the time of the trial no notice, it was stated, had been given to the Council. The defendant had been written to on several occasions, pointing out that a breach of the by-laws had been committed, but these letters had been ignored. Defendant pleaded guilty, but said he had sent a verbal notice to the Council. The Bench inflicted the maximum penalty of £5 and costs 9s.—At the Kirkham Petty Sessions John Wilkinson was summoned by the Fylde Rural District Council for erecting a building before depositing plans, and with using the said building as a house. For the Council it was stated that the defendant had erected several buildings in the district. Some time ago he built a laundry at Marton Moss. He presented plans for an addition to this and for three dwelling houses. Sanction for these was refused. He then proceeded to build, but not in accordance with the plans, and the addition was used as a dwelling house. The Council asked for a daily penalty in that case, but was willing that it should be suspended for fourteen days to give defendant time to get a house. For the defendant it was stated he intended the additions to the laundry to be a retiring room for the workers. The defendant let the laundry to another man, who did not require the additions, and thought they might be used as a dwelling house. It had been arranged that the house should be given up as a dwelling house, and hope expressed that the defendant would be considered ignorant of the by-laws. A fine of £1 and costs was inflicted in the first case and £1 and costs in the second, with a continuing penalty of 10s. a day, to be suspended for 14 days. Costs were also allowed.

Purchase of a House.—The case of *Metcalf* v. *Hosegood* came before Mr. Justice Stirling in the Chancery Division last week. This was an action for rescission of a contract to purchase Thorney House, Palace Gate, Kensington, and some adjoining land at the price of £88,000. The action arose in the following circumstances:—The property in question was conveyed to the defendant by a deed dated

February 1, 1898, and part of it was subject to certain restrictive covenants. The defendant, shortly after he purchased the property, commenced building operations with a view of erecting flats upon it, but encountered some difficulties in prosecuting his undertaking. He had a dispute with the London County Council as to the building line, which, however, was ultimately adjusted. He had another dispute with the trustees of the late Sir John Millais, the owners of an adjoining house, as to the access of light. He fell ill, and partly for that reason, partly through some financial difficulties, discontinued the building operations which he had begun. Lastly, on December 7, 1898, a gentleman named Rogers and the trustees of Sir John Millais brought an action against him (*Rogers* v. *Hosegood*) to restrain him from erecting flats on the site of Thorney House and the adjoining plots of land, on the ground that such erection would be a violation of the above-mentioned restrictive covenants. The pleadings in that action were completed, and the action set down for trial in May, 1899. In the spring of 1899 a Mr. McManus interested himself on behalf of the defendant in the sale of this property. On May 1 he had an interview with Mr. Farmer, an estate agent in the City, and asked him to submit the property to the plaintiffs, who carried on business as architects and surveyors, as one suitable for the erection of flats. At the meeting McManus produced to the plaintiffs plans and particulars of flats to be erected on the site. The plaintiffs' then entered into negotiation for the purchase of the property, with the view of erecting flats thereon. During the course of the negotiations the plaintiffs' solicitor had produced to him an abstract of the deeds containing the restrictive covenants. He also obtained the opinion of counsel on the covenants. The plaintiffs' case was that at no time during the negotiations was the existence of the action of *Rogers* v. *Hosegood* brought to their notice, but that, on the contrary, they were expressly told by McManus, in answer to inquiries on the subject, that there was nothing to prevent the building of flats upon the property. Ultimately the agreement for sale and purchase was entered into, and a deposit of £1,000 was paid by the plaintiffs. On November 21, 1899, the present action was commenced on the ground that the existence of the action of *Rogers* v. *Hosegood* had been concealed from the plaintiffs in circumstances which amounted to a misrepresentation of fact entitling the plaintiffs to avoid the contract. Mr. Justice Stirling, in giving judgment, said that he accepted the plaintiffs' version of the case, and found that McManus had represented to the plaintiffs that there was nothing to prevent a block of residential mansions from being built on the site. That was an untrue statement of fact, because the existence of the action of *Rogers* v. *Hosegood* did prevent the erection of such a block. His lordship further found on the evidence that the statement was untrue to the knowledge of McManus. It was said, however, that the representation was not material, because the existence of the restrictive covenants was disclosed. In his lordship's opinion it was material, notwithstanding such disclosure. At the time when it was made the plaintiffs and McManus were discussing the purchase not as lawyers (there was no lawyer present), but as men of business. The representation was that there was no obstacle to proceeding with the building of flats such as would have arisen from the opposition of the London County Council as to the building line or Sir J. Millais's trustees as to light. If the existence of the action had been disclosed his lordship could not doubt that it would have affected the decision of the plaintiffs, as men of business, whether they would or would not enter into the contract. His lordship further came to the conclusion that McManus must be treated as the defendant's agent, and consequently that the plaintiffs had made out a case for rescission of the contract.

Additions to Abbeydore Workhouse, entailing an expenditure of £2,865, have been approved by the Local Government Board. Messrs. W. P. Lewis and Co. are the contractors for the work.

Keystones.

A Memorial Window at St. Andrew's Church, Bristol, has been erected.

A New Academy at Linlithgow is to be erected. Mr. Fairley is the architect.

The Glasgow Central Stores, Limited, are erecting a large block of premises in Argyll Street, Glasgow.

One Hundred and Fifty Workmen's Dwellings at Edinburgh are being erected between the High Street and Cowgate.

A Clock Tower and Drinking Fountain has been erected at Maidenhead in commemoration of Her Majesty's Diamond Jubilee.

A Memorial to the late Mr. W. O. Foster, of Apley Park, Bridgnorth, is to take the shape of an institute for science, art and technical classes.

Workmen's Dwellings at Liverpool are proposed to be erected in Kempston Street, Gildart's Garden's and Fontenoy Street. The City Council will ask the Local Government Board for permission to borrow £30,000 for the purpose.

The Bristol Society of Architects held their annual excursion last Monday week. Cleeve Abbey was first visited. At Dunster the members partook of lunch, after which they visited the Castle and church. Dinner was had at Minehead.

A New Soldiers' Home has been opened at Warley by Major-General Sir William Gatacre for the men quartered at Warley Barracks, Brentwood. The establishment of the institution is mainly due to the efforts of Mrs. Stephenson, wife of General Stephenson.

The Ruskin Exhibition at Coniston has been very successful in its first week. The wiping-off of the old debt remaining on the Coniston Institute is assured, and sufficient is expected to be realised to raise an architectural monument to Mr. Ruskin in the form of a museum.

The Present Gaiety Theatre and Restaurant will be demolished in the next year or two in connection with the Holborn to Strand Street. The work of building their successors will be begun as speedily as possible on the site of property lying between New Church Court and Catherine Street, Strand.

Ripon Town Hall has been re-opened after extensive improvements from the designs and under the supervision of the City Surveyor, Mr. W. Edson. The plaster, tile and mosaic work has been done by Mr. W. F. M. Blackburn and the joiner's work, glazing and painting by Mr. E. Johnson, both of Ripon.

Restoration of Hessle Church.—Structural and other alterations are about to be made in the old parish church of Hessle, by which it is hoped that some of the architectural features of the church at present obscured will be opened out, and increased accommodation secured in the interior of the building.

New Law Courts for Leeds.—It is proposed to erect in Leeds new law courts. Birmingham has expended on law courts, exclusive of the value of the site, upwards of £113,000. Leeds is urged to act on the same lines, providing a new site for law courts and devoting the Town Hall to municipal purposes.

Art Library for Liverpool.—The Liverpool City Council have accepted a bequest under the will of the late Hugh Frederick Hornby, cotton broker, of a valuable art library and a collection of engravings, autographs, &c, for the use of the public, together with £10,000 to assist in providing a suitable building for the collection.

St. Illtyd's Church, Llantwit-Major, was opened last week after undergoing restoration in its western part. The fabric has been restored as closely as possible to the original Early English architecture. The restoration has been carried out from plans prepared by Mr. Halliday, the diocesan architect, and has cost nearly £11,000.

A Ruskin Memorial Tablet.—The Society of Arts is about to set up one of the society's memorial tablets on the house, 54 Hunter Street, Brunswick Square, W.C., in which John Ruskin was born. The necessary permission has been obtained from the ground landlords (the board of the Foundling Hospital) and the lessees, and the tablet will be erected as soon as it has been prepared.

Isolation of the National Gallery.—In answer to Lord Balcarres in the House of Commons last Friday, Mr. Akers-Douglas said the purchase of property, with a view to creating a clear space of not less than 40ft. wide to the west of the National Gallery, had been agreed to, in principle, by the Government and the vendors; and negotiations were now in progress as to the settlement of the price to be paid. The purchase should be shortly completed.

Bangor Cathedral Undermined. — Bangor Cathedral was recently the scene of a startling incident. During the service the sacristan discovered that near the west end of the building the tiled floor was opening and gaping all around him. The sermon was stopped and the congregation dismissed. The phenomenon is supposed to have been produced by the recent heavy rainfall and the great heat combined. It is, however, significant of the treacherous character of the cathedral subsoil, and, to a certain extent, justifies the fears of some people as to the safety of the venerable structure.

Ironwork in Catherine Court.—An attempt is being made to destroy the remains of a gateway of Catherine Court, in Seething Lane. It is a good specimen of Renaissance ironwork. The tenants are attempting to stop the breaking down of it. The agent's pretext or reason for doing away with it—if not altogether, at any rate from the spot where at present it proves a refreshing relief from the surrounding ugliness—is that the gate is rotten, and consequently dangerous. There are half-a-dozen means of arresting, or at any rate neutralising, the decay and of making the structure safe.

Roman Potter's Kiln Discovered. — Mr. Thomas May, a Warrington antiquary, states that a discovery of a very interesting character, from an archæological point of view, consisting of a Roman potter's kiln and a large deposit of potters' waste, has just been made at Stockton Heath. The potters' waste was mixed with soft clay and charcoal, and was at a distance of 4ft. to 6ft. east from the fire-holes, and about 3ft. below the sod. The whole mass was about 5ft. long, 3ft. wide and 2ft. 6in. deep, and it included fragments of urnæ (jars), mortaria or pelves (mortars), patellæ (dishes), ampullæ (water bottles), urcei (pitchers), &c., in common soft red and black or smoke-tinted (Upchurch) ware, and a few pieces of grey and indented ware.

New Mission Church for Leeds.—At Burley a new mission church at the foot of Cardigan Terrace is being erected. The foundation stone of this church—to be known as St. Columba's Mission Church—was laid last week. The cost is estimated at about £2,000, of which some £1,310 is already promised. Mr. Percy Robinson, the architect, of Leeds, has designed a structure of brick in the Gothic style to seat 500. In addition to the church, a schoolroom with kitchen and ante-rooms, as well as a bell-turret at the west end of the building, are provided for. The contracts are let to Mr. J. T. Wright, Leeds (bricklaying); Messrs. J. Ledgard and Son, Ventnor Street, Leeds (joinery); Messrs. Mountain and Son (plastering); Mr. A. Ackroyd (painting); and Messrs. Teal and Somers (heating apparatus).

Sir W. B. Richmond on Art.—Sir W. B. Richmond, R.A., opened the second annual fine art exhibition in Sayes Court Hall, Deptford, last week. He said it was his strong belief that art in its various forms was the expression of a nation's greatness or its littleness. No great people that had ever lived had been without their literary, musical and artistic characteristics, and it was a striking proof of the greatness of England that it had produced the greatest landscape painter the world had ever seen. He much regretted that so little attention was paid to the artistic education of

the average man. Art, in his opinion, was inherent in the race, and there was not the slightest reason why the teaching of drawing should not be held to be of as much importance as the teaching of reading and writing.

Malmesbury Abbey Restoration.—The work of the restoration and rebuilding of this venerable structure is proceeding steadily. The work is being carried out in three sections, two of which are partially accomplished. The first and most important task was the restoration and strengthening of the six bays of the eastern portion, which are used as the parish church, and in this was included the preservation of the ruined remnants of the original east end. In the second section the chief object was the reparation of the south-west buttress, necessary for the stability of the edifice. These works, it is anticipated, will involve an outlay of £10,000, and a similar amount will be needed to fill up the yawning chasm between the existing nave and the west front. It was by the fall of the west tower in pre-Reformation times that the three western bays of the nave were destroyed. The present abbey dates from the twelfth century, but a church had been built on the same site five centuries before.

English-made Clock for Toronto.—At the Bell Foundry of Messrs. Gillett and Johnston, Croydon, last week, a third bell to be put up by the Municipal Corporation of the City of Toronto to commemorate the completion of the New City Hall Buildings, which were begun in 1889 and finished in the year 1899, was cast. The competition for the work had been first thrown open to the world, and then confined at the second stage to three English firms, of which Messrs. Gillett and Johnston were successful. The clock is to have four 20-feet faces and three bells; the hands are to be of copper, the minute being 9ft. and the hour 5ft. long; the frame of the works is 9ft. by 3ft. Of the bells, three in number, the largest was cast a fortnight ago, and weighs 5 tons 7 cwt., having an inscription setting forth the reason of its erection, and containing in all over 700 letters. The bell is 6½in. in thickness at the sound bowl, the diameter being 6ft. 8in., and 6ft. in height. The middle bell weighs, or will weigh, 27 cwt., and the bell cast last week is to weigh 18 cwt.

City and Guilds of London Institute has conferred the diploma of "Associate of the City and Guilds of London Institute" on the following matriculated students who have this year successfully completed a full course of instruction at the City and Guilds Central Technical College:—Civil and Mechanical Engineering, R. Freeman (Siemens Medal), J. M. Bowrey, A. Bromley-Smith, J. F. Butler, A. H. Clark, W. H. C. Clay, R. H. Collins, A. E. Culley, F. Dennis, B. M. Duke, C. W. Jones, A. J. Knight, S. Leslie, A. J. Munro, F. Osbourn, W. J. Rusdell, J. W. M. Topley, H. B. Unwin and J. A. Wickham. Electrical Engineering, T. L. James (Siemens Medal and premium), V. M. Allen, F. C. M. Berge, J. H. Brown, H. Burgh, H. H. Crockford, B.A., W. A. Del Mar, E. Fawssett, P. Good, S. Gowan, H. J. Humphreys, A. P. Hutchinson, H. L. E. Kennard, W. J. Line, F. G. Maunde-Thompson, G. H. Montgomerie, J. A. Parker, H. J. Thomson and M. A. Wood. Chemistry, E. J. Denney, P. V. Dupré, J. A. Fortesquieu, J. B. Gall, T. H. Page, T. R. Starkey, J. H. West and W. B. Woodbridge.

Crystal Palace School of Art (Ladies' Division) held its annual distribution of prizes recently. This year the school has been removed from the north to the south end of the Palace, where better light and much more accommodation have been secured, and the change has given general satisfaction. The art work of the students was exhibited in the classrooms. The scholarship for the year 1900-1901 was awarded to Miss Constance Bright, who also won the medal for portrait or costume painting. The following other medals and certificates were presented:—For drawing from life or modelling from life, Medal, Miss Isabel Ritter, who likewise obtained the certificate in the class for portrait or costume painting; certificate, Miss C. Bright. For drawing or modelling from antique, Medal, Miss Isabel Ritter; certificate, Miss C. Bright. For painting, landscape, animals, &c., Medal, Miss M. L. Kendall; certificate, Miss Ethel French. For original design, Medal, Miss Eva Marsh; certificate, Miss Isabel Ritter. Certificates were granted in several other classes. The prize for drawing from still life was obtained by Miss Una M. Beaumont.

School Board Accommodation.—The annual report of the School Accommodation and Attendance Committee of the London School Board states that the number of children scheduled by the visitors in May last, including 57,305 over thirteen, attending school was 885,017. The number of children scheduled by the visitors in May, 1899, including 57,456 over thirteen, attending school was 888,466. The number of children of three to thirteen scheduled this year, plus those over thirteen, attending school was less by 3,499 than the corresponding number of children for 1899. The number of school places estimated to be required in May, 1900, was 781,553. The number of permanent school places existing on March 25th last was 752,881. On the same date the number of projected school places was 51,819. In addition to those, there were 18 sites projected or in possession upon which the Board of Education had not been asked to sanction any specific number of school places. The total number of places existing or projected in March last was 804,500. In the excess of deficiency of school places, subdivision by sub-division, the result for the whole of London was a net excess of 22,947. In calculating the deficiency 14,989 places in temporary schools had not been included.

New Patents.

These patents are open to opposition until September 11th.

1899.—Heating Stoves.—14,292. WILLIAM YOULTEN, 159 Victoria Street, Westminster. A stove is divided into two grates, one intended for coal or other fuel and the other for gas, and is constructed so as to revolve about a vertical axis by means of top and bottom pivots. The gas supply can be utilised to ignite the fuel. To prevent the heat from the gas fire igniting the coal when the latter is not in use, a hollow fireclay partition is placed between, the hollow being filled with non-conducting material. It is claimed that the stove allows of an apartment being heated by gas or solid fuel as desired.

Carbide of Calcium.—16,763. C. H. WORSNOP, 6 Carlton Place, Halifax. A mixture of paraffin wax, cocoa butter and sugar in equal parts is heated until fluid and carbide of calcium immersed in the hot liquid until impregnated. The resulting material is called "Acetyloid," and, it is claimed, is unaffected by water, except under pressure.

Glazing for Roofs.—17,366. W. LAWSON, 15 Posterngate, Hull. Covers or cappings are secured to glazing bars by a tubular rivet with open ends in combination with a smaller rivet or bolt.

Bricks for Flat Ceilings, &c.—17,398. P. ROWALD, 22a Marienstrasse, Hannover, Prussia. For the construction of fireproof ceilings and floors hollow bricks are made with flat, roughed tops and bottoms, with sides ogee shaped on section, so that they fit exactly with each other side by side. It is claimed that this shape avoids all side pressure on the joists or T-irons supporting the floors.

Cement Tiles.—17,470. H. BRÖCKER, Markranstädt, near Leipzig, Germany. For the purpose of securing a perfect adhesion of the lap to the body of the tile a cutter scrapes away from the upper surface of the tile, which has been previously smoothed down and covered with colouring powder, a thinner or thicker layer of material in the places in which the laps are to be formed by the putting on of a fresh body of cement.

Decoration of Ceilings, Walls, &c.—18,012. P. TAYLOR, Glendale, Woodham Walter, Maldon. Panels of glass have wall-paper or other material secured on the backs. The panels are secured in position by strips or beads.

1900.—Imitation Stone, Tiles, &c.—6,455. L. HATSCHEK, Vocklabruck, Upper Austria. Slabs or tiles are made from fibrous asbestos and cement or hydraulic lime. The shape or surface is varied by means of presses.

Filtering Sewage.—6,957. A. PUECH, Mazamet (Tarn), France. A filter is formed by gravel on metal supports, which, while contributing to the physical purification, provides two regions, the one aërobic and the other anaërobic, thus bacteriologically purifying.

Interlocking Brick.—9,725. E. H. VORDTRIEDE, 2,019 Sidney Street, St. Louis, Mo., U.S.A. The brick has a rib or ridge along one face adjacent to the edge of the brick and a groove of same curvature along the opposite face. Recesses in one or other of the other faces and keys interlock the bricks.

Fireproof Floors or Ceilings. — 9,738. V. SCHULZ, U6 No. 19, Mannheim, Germany. The metal insertions to stiffen the concrete are made of U-shape.

Ventilating Appliance. — 9,813. J. W. THOMAS, 32 Queen Victoria Street, E.C. To avoid a wind sucking air out of a building so as to cause reduced pressure inside an adjustable valve is arranged in a hood or turret. A pointer on a scale shows when to regulate the valve.

Working Stone.—9,967. T. STIGLIZ, 17 Pressgasse, Vienna IV., Austria. This invention consists of a machine for working stone surfaces in which the tool receives a reciprocating motion in a direction vertical or inclined to the surface to be worked and at the same time a rotation in one direction, the tool being adjustably attached to a sliding block which is movable vertically and horizontally along guide rails.

The following specifications were published on Saturday last, and are open to opposition until September 18th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—7,457. CRITCHLOW, filter-presses. 12,223, WOOD, combustion furnaces. 14,577, ADAMS, water and waste-water closets and fittings. 15,453, COLE, valves. 15,551, DAVIDSON, means for supporting electric incandescent lamps. 15,623, ELLIOT, brace for drilling purposes. 15,629, WILLSHEAR AND AMOS, refuse destructor furnaces. 15,988, SEFTON-JONES (*Soc. Anon. des Engrais Complets*), quick removal to a distance of town refuse and its conversion into manure. 16,200, OPPENHEIMER (*Actiengesellschaft Mix and Genest*), holders for electric incandescent lamps. 16,880, TOMLINSON, purification of sewage by biological means. 17,253, CUTMORE, water-tight connections for speaking and other tubes or pipes. 17,376, GILES, acetylene gas purifiers. 17,794, KAY, method of forming sloping roads or footways, subways, passages, &c. 18,011, STONE AND CHEELD, wood-planing machines. 18,187, FONTY AND FONTY, apparatus for unloading heavy timber from waggons. 18,497, TREY, construction of drawing boards and blackboards. 18,533, COX AND HARVEY, fire-irons. 18,584, MILNER, water valves. 19,835, HAIGH, tread for wheels, stairs, &c. 21,409, KAPRALIK, cocks or valves. 23,068, RICHARDSON, heating apparatus. 24,911, LEVICK, work-sets for tools and machinery.

1900.—250, ENGELKE AND MEYER, dry gas meters. 520, PRIDMORE, machines for making sand moulds for castings. 1,703, BALDWIN, knobs suitable for use as bedstead knobs, fender knobs, door knobs and drawer knobs. 3,564, MAYER, smoke prevention and combustion of gases in fires for domestic purposes, and furnaces for heating and raising steam. 6,403, WILTON, appliance for arresting and collecting sparks and particles issuing from chimneys. 7,056, VAUGHAN, construction of tanks for water. 8,263, DILWORTH AND CARR, valve applicable to heating apparatus. 8,419, GOLBY (*Schüller*), artists' frame for painting. 8,467, HADDAN (*Chisholm*), excavators. 8,468, HADDAN (*Chisholm*), excavators. 8,665, JOHNSON (*Wellman-Seaver Engineering Co.*), furnace charging apparatus. 8,670, MARKS (*Compagnie Générale de Travaux Sanitaires, Soc. Anon.*), furnace for

incinerating dirt and refuse of towns. 8,672, Cavenaugh, automatic smoke preventers. 8,796, Barr, multiple sawing machine for cross-cutting deals or battens into paving blocks. 8,934, Burns, smoke-preventing apparatus. 9,565, Bachmeyer, jet holes for the gas supply of burners of Bunsen kind. 10,137, Krayn, electric lamps. 10,155, Laird, furnace for heating drills by means of liquid fuel or gas. 10,347, Häckel, windlass for venetian blinds or other loads. 10,371, Hart, bolts, rivets, screws, &c. 10,467, Prunell, means for operating the taps of gas lights. 10,729, Hauenstein and Cleckner, method of producing pictures in relief. 10,730, Harris, fire escapes. 10,788, McCloskey and Kay, devices for use in the construction of wire fencing.

Masters and Men.

The West Bromwich Master Builders' Association paid a visit to Bristol last week, where they inspected St. Mary Redcliff Church, St. Peter's Hospital and the Council House.

A Glassworkers' Strike in Belgium has occurred. Eleven out of 19 factories in the Charleroi district, have closed, 10,000 men being out. The strike will probably deal a fatal blow to the glass industry of Belgium. Many large manufacturers have decided to take this opportunity for definitely closing their works, which suffered much by the increased price of coal.

Cardiff's Lock-out Clause.—The agitation by the Cardiff Master Builders' Association for the inclusion of a lock-out clause in the Corporation contracts has ended in a victory for the organised workmen of the town, who had opposed it on the main ground that it would be prejudicial to their interests, as it would provide the employer with a weapon which might be used against the associated workers, and which formed no part of the code of working rules now governing the building trades in the borough. The question had been much debated, and the Corporation had practically expressed a desire to follow the precedent of the London County Council in the matter. At the last meeting of the joint committees of the Public Works and new Town Hall, to whom the matter had been referred, the Town Clerk stated that he had analysed the contract forms in use by the London County Council, and also those adopted by the Borough Councils of Manchester, Leeds, Nottingham, Huddersfield, and Newcastle. In none of the contracts made by those corporations was there a reference to a lock-out. On the suggestion of Alderman David Jones it was agreed that a lock-out clause should not be inserted in any contract made by the Public Works Committee, as well as in the contract for the new Town Hall.

Workmen's Compensation.—A Parliamentary paper has just been issued containing statistics of proceedings under the Workmen's Compensation Act, 1897, and the Employers' Liability Act, 1880, during the year 1899. In the majority of cases, compensation being settled by agreement or by informal arbitration, and no memorandum being registered, no official information is available. With regard to the Employers' Liability Act, the state of things is similar. The first table given shows the number of cases under the Workmen's Compensation Act dealt with in England and Wales during 1899 by County Court Judges and County Court arbitrators. The total number settled in County Courts during the year was 999, of which 828 were decided by award of the Judge, 98 by award of an arbitrator appointed by the Judge, and 73 by acceptance of money paid into Court. There remain 348 cases which were withdrawn, settled out of Court, or otherwise disposed of in such a way as not to enable the officials of the Court to state definitely the results. Of the 999 cases finally settled within the cognisance of the Courts, the decision in 753 was for the applicant and in 246 for the respondent. The number of cases under the six heads of employment to which the Act of 1897 applies are:—Railway 104, factory 686, mine 233, quarry 51, engineering works 114, building 159—total, 1,347. The Parliamentary paper says it would appear that in mines the Workmen's Compensation Act, 1897, has practically displaced the Employers' Liability Act, and in railway works has taken about half the cases; while in factories, quarries, buildings, and engineering works the reduction in the number of cases is comparatively small. In the English, Scotch, and Irish lists there are 69 cases in which the point at issue is stated, including 11 which are noted as involving two points each. In 26 out of the 69 cases the question that arose was whether the workman's employment was one to which the Act applied. In 18 of these its application to a factory was in dispute; in five cases its application to a building was questioned; while the three remaining cases had reference one to a railway and the two others to engineering works. In 13 cases the critical question was the meaning of the words "arising out of and in the course of his employment"; whilst in five of these 13 cases, and also in two other cases, the meaning of the term "serious and wilful misconduct" was at issue. Six cases turn on the question of who are "dependents." The remaining cases are scattered over various points in the Act—three as to the meaning of "personal injury by accident," two as to "average weekly earnings," two as to "incapacity for work," &c.

Engineering Notes.

The Electric Tramway System in Norwich on the overhead traction has been opened. There are 25 miles of line.

Sawdust Briquettes for Heating.—In Austria a new form of fuel, invented by Joseph Fialla, is reported to have been introduced with promising results. It consists of sawdust briquettes for use for domestic heating purposes. The dust is heated to dryness, and then to the point where the tarry elements begin to exude. These are used as the consolidating matter, the hot sawdust passing on steam-heated tables to a press which forms them into briquettes, 5in. by 3in. by 1½in., weighing about ½lb. It is said that they give 4 per cent. of ash and that their heating power is equivalent to that of lignite. The press used in Mr. Fialla's factory makes nineteen bricks per minute, and with 300 days of work has a capacity of 6,000,000 briquettes per year. Experiments have shown that the cost of manufacture is 8d. per 1,000, while the selling price is 4s. per 1,000.

Tramway Extensions in London.—At last week's meeting of the London County Council the report of the Highways Committee recommending that powers should be sought in the next session of Parliament for a large extension of the tramway system of the Metropolis was adopted. The proposals are for the construction of new tramways of a total length of about 16¼ miles on the north side of the Thames, at an estimated cost for the tramways and necessary paving and other works of about £461,300, and for street widenings of about £544,330; while, as regards the south side of the Thames, the total length of tramways is about 12 miles, the cost of construction and paving works is estimated at about £374,500, and of the street widenings at about £449,000. The total estimated outlay involved, including the cost of extra cars and car-sheds, is £1,941,800. As to the street widenings, it is intended that the Improvements Committee shall contribute out of funds applicable to improvements sums amounting in the aggregate to £355,000, and the road authorities £326,000. The remainder of the cost of the street widenings, £312,067, is to be charged to the tramways account as part of the first cost of the several tramways. It is proposed that the new lines shall, with one exception, be constructed for horse traction, unless in the meantime effect shall have been given to the provisions in the company's lease relating to the conversion of the system from horse to electrical traction. The estimates provide, however, for rails of sufficient weight to permit of their being used for electrical traction when that system shall have been adopted on these tramways.

Electric Tramways for Liverpool.—The reconstruction of the Liverpool tramroads and the change from horse to electric haulage is being carried on at a rate which, it is claimed, has not been equalled anywhere. The City Corporation having decided to adopt the overhead trolley system an experimental line from St. George's Church to the Dingle (about two and a half miles) was opened on November 16, 1898. The experiment proved a great success, and the work of reconstruction commenced. Last year no less than 30 miles of track were relaid. Up to date 80 miles of track have been reconstructed with overhead installation, and the officers hope to complete the electric tram system over the whole city this year. At first it was hoped to lay a mile of track per week, which had never been done before, but during the past few months the rate of progress has been two miles a week. Powers have been obtained to lay 114 miles of track, but Mr. Bellamy, the general manager, doubts whether the whole will be constructed. He says, however, that by the end of this year the Corporation will have cars adequate to carry 100 million passengers a year, while by the early summer of next year they will be able to cope with 150 millions. The Corporation have 116 horse trams, 39 omnibuses, and 160 electric cars, besides 2,600 horses. As to fares, passengers can now travel from two to two and a half miles for 1d. At the end of the year 1d. will take a passenger from the pierhead to the old borough boundary, and 2d. to the extreme bounds of the extended city. It is hoped that in another year a uniform 1d. fare will be established, when passengers will be able to travel nearly eight and a half miles for 1d.

CLAY IN MODERN BUILDING.

THE use of burned clay in nearly all classes of modern building construction is to-day more extensive than at any time in the history of the building trades, and there are many reasons which indicate that its use is destined to increase greatly in the years to come. In all the varied forms in which the substance is thus employed its abundance makes its use a matter of economy, and at the same time it is the most efficient material obtainable and has a wonderful adaptability to the varied building uses. As to its ability to withstand climatic conditions there has never been any question, for no better material for resistance to heat and cold is obtainable. Like all other building materials, in the hands of ingenious craftsmen clay is directed into many different channels of usefulness. Its strength is not to be questioned, and all kinds of burned clay are readily beautified in form and colour.

To meet the modern demands there have been many improvements in brickmaking. Shape, texture and colour have all been greatly improved, and at the same time there has been a decided reduction in the cost of production by the improvements in brickmaking appliances. Perhaps the advances toward adapting this building material to the exact requirements of builders have been greater than in any other building material. To-day brick architecture may well be regarded as the foremost feature of building construction from an æsthetic point of view, as well as from a practical and economic one.

Just what departures along building lines will in the future be opened up to the brick trade would be hard to say, but in view of the varied uses to which this building material is already applied there can be no doubt that our enterprising brick manufacturers will readily, aided by the skill in their employ, adapt their product to all new requirements of the building trade. Pure clay, the leading essential to perfection in this line of production, is one of the useful products of which we never hear anything regarding its depletion. The raw product for the continued advances in brickmaking, therefore, leads us to look forward to many further in this already excellent building product.

New Companies.

Selby Brick Company, Limited.

This company was registered on July 23rd with a capital of £10,000 in £1 shares to carry on the business of brick and tile makers, builders' merchants, &c. The first directors (to number not less than three nor more than five) are G. Keeble, J.P., A. J. Keeble, J. T. Keeble and S. G. Richardson. Registered office: Cowgate, Peterborough.

Ford Limestone and Brick Company, Limited.

This company was registered on July 24th with a capital of £1,500 in £1 shares to acquire part of the business carried on at Claxheugh, near Sunderland, as the Ford Limestone and Brick Company, and to carry on the business of brick, tile and pipe manufacturers and merchants, &c. Registered office: The Works, South Ford, Hylton Road, Sunderland.

T. W. Harvey and Sons, Limited.

This company was registered on July 23rd with a capital of £9,000 in £10 shares to acquire the business carried on at 180 and 181 High Street, Cheltenham, as T. W. Harvey and Sons, and to carry on the business of iron merchants, ironmongers, &c. The first directors (to number not less than three) are T. W. Harvey, T. W. Harvey, jun., and A. J. Connop. T. W. Harvey may retain office and act as managing director so long as he holds 100 shares.

Brockie-Pell Arc Lamp, Limited.

This company was registered on July 12th with a capital of £80,000 in £1 shares to adopt an agreement with the Brockie-Pell Arc Lamp, Limited (registered in 1896), and to carry on the business of manufacturers of and dealers in electric arc lamps, electric incandescent lamps, and electrical appliances; and the business of an electric lighting company in all its branches; as quarry owners, stone merchants, builders and contractors, &c. The number of directors is to be not less than three nor more than seven; the subscribers are to appoint the first.

Desford Coal Company, Limited.

This company was registered on July 16th with a capital of £70,000 in £1 shares generally to carry on the businesses of colliery proprietors, coalmasters, ironmasters, brick, pipe, tile and coke manufacturers, coal and fuel merchants, miners, smelters, ironfounders, engineers, and manufacturing chemists; to get and deal in ironstone, limestone and clay; makers of briquettes, pig and manufactured iron, steel, timber and lime. The first directors (of whom there shall be not less than three nor more than seven) are H. Bramall, R. M. Knowles, W. J. Lamb, E. Pilkington and J. Stone.

Nottingham Patents Company, Limited.

This company was registered on July 21st with a capital of £1,000 in £1 shares to acquire Patent No. 75 of 1897, granted to W. T. Norris for improvements in chimney-pots, with an invention by the said W. T. Norris for improvements in ventilators or air inlet valves for drains and the like, and an inspection pipe for drains, and to take over the business of the Nottingham Patents Company. The first directors (to number not less than three nor more than seven) are A. Ball, A. Hitchin and S. Williams. Registered office: King Street, Nottingham.

Upper Hanley Pottery Company, Limited.

This company was registered on July 18th with a capital of £10,000 in £1 shares to acquire the business carried on by J. Wilcox and Sarah Hollinshead as the Upper Hanley Pottery Company, and to carry on the business of earthenware and china manufacturers and merchants, &c. The first directors (to number not less than three nor more than five) are to be appointed by the subscribers, provided that any one director so appointed shall have the right to nominate J. Hollinshead in his stead. Registered office: Upper Hanley Works, High Street, Hanley, Staffordshire.

Associated Portland Cement Manufacturers (1900), Limited.

This company was registered on July 10th by Ashurst, Morris, Crisp and Co., 17 Throgmorton Avenue, E.C., with a capital of £5,000,000 in £10 shares to adopt and carry into effect an agreement made between the British Incorporators, Limited, and this company, and, generally, to carry on the businesses of manufacturers of and dealers in all kinds of cements, limes, plasters, artificial stone, and as dealers in all materials used in the manufacture of the same; makers of whiting, sacks, bricks, tiles, terra-cotta goods and building materials of all kinds; as quarry owners and stone merchants, builders and contractors, &c. The first directors (of whom there shall be not less than ten nor more than forty) are to be elected by the signatories W. Barrier, D. J. Prosser, G. E. Sanders, W. H. Cuell, E. A. Lloyd, E. T. Church and H. W. Brown.

Hosea Tugby and Company, Limited.

This company was registered on July 13th with a capital of £100,000 in £1 shares to acquire as a going concern the business and undertaking heretofore carried on by H. Tugby at the Briton Potteries, Moira, near Ashby-de-la-Zouch, Leicestershire, and at the Canal Potteries, Old Kent Road, London, under the firm of Hosea Tugby and Co., as manufacturers of sanitary pipes and other earthenware and sanitary appliances; to acquire brickfields, beds of clay, terra-cotta earths and other substances of a like nature; as ironmasters and manufacturers, smelters, steel converters and manufacturers, engineers and ironfounders, timber and builders' merchants, &c. The first directors (of whom there shall be not less than three nor more than five) are H. Tugby, Moira, Ashby-de-la-Zouch; W. J. Kirkley Birkenshaw, Bank Buildings, Derby; and H. R. Tugby, Pepys Road, St. Catherine's.

COMING EVENTS.

Wednesday, August 8.

INSTITUTE OF SANITARY ENGINEERS.—Meetings of Examination and Literary Committee at 2.30 p.m., General Purposes and Finance Committee at 3.30 p.m., Election Committee at 5 p.m., and Council at 7 p.m.

Saturday, August 25.

NORTHERN ARCHITECTURAL ASSOCIATION, NEWCASTLE-UPON-TYNE.—Visit to South Shields.

CONTRACTS OPEN.

TAUNTON CORPORATION WATER WORKS.

The Taunton Town Council are prepared to receive TENDERS for the CONSTRUCTION of a STORAGE RESERVOIR and other Works at Luxhay, Pitminster, about six miles from Taunton.

Drawings may be inspected and specification and schedules of quantities and forms of Tender may be obtained at the Offices of the Engineer, Mr. F. W. ROBERTS, Taunton; or of the Water Works Manager, Municipal Offices, Taunton, on and after the 4th instant, upon payment of £2 2s., which will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, upon the form supplied, addressed to the Town Clerk, Municipal Buildings, Taunton, and endorsed "Tender for Reservoir," must be delivered on or before MONDAY, the 27th day of AUGUST instant.

The lowest or any Tender will not necessarily be accepted.

Dated 1st August 1900.

GEORGE H. KITE.
Town Clerk.

COUNTY BOROUGH of CARDIFF.
NEW TOWN HALL AND LAW COURTS.

The TIME for delivery of TENDERS for the above Works has been EXTENDED to MONDAY, the 17th day of SEPTEMBER, 1900.

By order,
J. L. WHEATLEY,
Town Clerk.

Town Hall, Cardiff,
July 1900.

BOROUGH of SHOREDITCH.

The Shoreditch Vestry invite TENDERS for the ERECTION and COMPLETION of a REFUGE DWELLING in Reeves Place, Hoxton.

The drawings and specification may be seen and bills of quantities, forms of Tender, and other information obtained at the office of Mr. J. RUSH DIXON, A.M.I.C.E., Surveyor, on payment of a deposit of One Guinea, which will be returned on receipt of a bonâ-fide Tender.

An approved surety in the sum of £100 must be provided, and trade union hours and wages observed, and no sub-letting will be allowed.

Sealed Tenders, endorsed "Reeves Place Refuge," to be delivered at my Office not later than NOON on TUESDAY, the 21st day of AUGUST next.

The Vestry do not bind themselves to accept the lowest or any Tender.

By Order,
H. MANSFIELD ROBINSON.
Solicitor and Clerk.

Town Hall,
Old Street, E.C.,
July 1900.

TO MANUFACTURERS of PORTLAND CEMENT.

The London County Council is prepared to receive TENDERS for the SUPPLY of PORTLAND CEMENT for the six months ending March 31st, 1901.

Forms of Tender may be obtained on application to the Manager, London County Council, Works Department, Belvedere Road, Lambeth, S.E. The latest time for the receipt of Tenders is NOON, on August 14th next.

The Council does not bind itself to accept the lowest or any Tender.

C. J. STEWART,
Clerk to the Council.

Spring Gardens, S.W.,
August 1900.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

FARNHAM.—For additions to school buildings, Bradshot Lea, for the School Board. Mr. H. Paxton Watson, architect, 4 Adam Street, Adelphi. Quantities by Messrs. John Leaning & Son :—

Drowley & Co.	£998	G. Kemp, Aldershot *	£820
Bateman	975	* Accepted.	

FRINTON-ON-SEA.—For proposed making-up and sewering parts of Ashlyns Road and Third Avenue, for Mr. R. P. Cooper. Messrs. Homer & Co., surveyors :—

Making-up and Sewering Ashlyns Road.

Pedrette & Co	£1,223	H. J. Lingell	£629
F. W. Anderson	678	Moran & Sons	603
Burgoyne & Sons	665	Mackenzie & Son	564
J. C. Trueman	662	Dupont & Co.	520

Making-up Third Avenue.

Pedrette & Co.	£1,385	Moran & Sons	£1,950
Burgoyne & Sons	2,258	J. C. Trueman	1,930
F. W. Anderson	2,202	Mackenzie & Son	1,897
H. J. Lingell	1,976	Dupont & Co.	1,832

FRINTON-ON-SEA.—For proposed slip-way and approach road for Mr. R. P. Cooper. Messrs. Homer & Co., surveyors, Estate Office, Frinton-on-Sea, Essex :—

Slip-way.

Pedrette & Co.	£2,054	J. C. Trueman	£1,141
H. J. Lingell	1,826	F. W. Anderson	1,095
Mackenzie & Son	1,730	Burgoyne & Sons	1,054
Dupont & Co.	1,629	Moran & Sons	955

Approach Road.

Pedrette & Co.	£825	Burgoyne & Sons	£271
H. J. Lingell	389	J. C. Trueman	250
Mackenzie & Son	350	Moran & Sons	219
Dupont & Co.	330	F. W. Anderson	201

FRINTON-ON-SEA.—For parts of works of sewering and making-up new road from Holland Road, Frinton, to Lower Barn, Great Holland, for Mr. R. P. Cooper. Messrs. Homer & Co., Frinton-on-Sea, and Messrs. Baker & May, Clacton-on-Sea, joint surveyors :—

Pedrette & Co.'... ...	£9,773	Mackenzie & Son	£4,976
H. J. Lingell	5,436	F. W. Anderson	4,894
Dupont & Co.	5,399	Moran & Sons	4,555
J. C. Trueman	5,165	Burgoyne & Sons	4,319

For the whole of the above works for Mr. R. P. Cooper, under the superintendence of the above surveyors :—

J. C. Trueman	£8,900	F. W. Anderson	£8,500
Burgoyne & Sons	8,563	Moran & Sons	8,150

HANLEY.—For additions to "Sentinel" office, Hanley. Messrs. R. Scrivener & Sons, architects, Hanley :—

Grant & Son	£4,500	F. Godwin	£4,199
Cornes & Son	4,498	W. Cooke	4,150
A. Ward	4,480	J. J. Longden,	
G. Ellis	4,480	Burslem*	4,045
J. Gallimore	4,414	* Accepted.	

HANLEY (Staffs.)—For proposed additions, extensions, and alterations, Joint Infectious Diseases Hospital, Bucknall, Staffordshire. Mr. E. Jones, architect, Albion Street, Hanley :—

Previous Contracts for Hospital Extensions, viz.,

Eighteen-bed Pavilion and Additions to	18-Bed Pavilion.	Administrative Block.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

August 15, 1900. No. CCLXXXVIII.

Effingham House, Arundel Street, Strand, W.C.

An Architectural Causerie.

A Side-light on the Gothic Revival.

When a great man dies the astonished readers of the daily papers are confronted immediately with an account of the whole career of the deceased. With remorseless candour his chequered past is laid bare for the edification and amusement of a curious public. Or, "touched with human gentleness and pity," a veil is drawn over the shady places in his history and character, and only his intellectual and other endowments form the subject of eulogium or reproach. With the departing breath the telephones are at work, deft compositors are busy with the long catalogue of good deeds or ill, and the tale is promptly forthcoming. This promptitude is to simple folk a wonder and a surprise. But the initiated know well how it is done. The biography was ready—cut and dried, with the necessary blanks for eventualities—and pigeon-holed long ago in case "anything might happen." The century itself is moribund. What voluminous retrospects will follow that dissolution? The most eventful of all the centuries will have copious and perhaps adequate record from all imaginable points of view, religious, social, political, scientific, artistic, and what not. Amongst these, architecture, as having run a somewhat remarkable course, will claim a place, and furnish matter for much philosophical and other speculation and comment. In such a record, the rise, progress, and decay of the Gothic Revival will demand due attention. Much has already been written on this phenomenon, and the merest literary ignoramus will find to his hand material enough, of a sort, to facilitate the usual commonplace compilation. But there is a feature of that revival which has not hitherto been sketched in detail, if, indeed, it has not been altogether overlooked, and as it must be placed to the credit side of the account we venture to call attention to it here. We allude to the ethical value of the singular movement called the "Gothic Revival" and its bearing upon human motives and character.

The foundations of that movement were laid on the rock-bed of Truth. War—unrelenting war—was declared against all shams, hypocrisies, "unveracities, speciosities," and the like. Whatsoever thing was to be done should thenceforth be done honestly, and all things should be in fact what they were in appearance. There should be an end of all trick, finesse, concealment, subterfuge, and all their obscene brood. Thus the student entering upon his daily work had ever before him a clear, consistent, high ideal. Perfect directness and simplicity of plan and contrivance, perfect honesty in construction and perfect candour in the means employed were guiding principles, all-pervading, unrelaxing. Beauty desired of all would, he was taught, follow their faithful observance. The great works of old were thus accomplished, and endeavours as earnest and as pious as those of our forefathers would achieve results no less glorious than theirs. This healthy, brainy moral tone elevated both the work and the workers, and lifted art almost to the rank of religion. There were, we all know, periods of great social depravity, when art attained a high and enduring renown; and there were periods of great moral and religious activity when art may scarcely be said to have existed. But there was a long succession of centuries when the purest morality and greatest religious fervour went hand-in-hand with the highest reach of art. These considerations—however the balance of opinion may lie—do not touch the point which it is now our aim to enforce—to wit, that for a great part (indeed, the greater part) of the present century a band of earnest, resolute men did sincerely believe in the mutual interdependence of art and morals, and upon this belief did base strenuous and unwearying effort. It is fair to assume that so salutary a faith and such a noble ambition to be in all things and before all things true must have re-acted upon character, and that a habit of working daily with such a standard had a wholesome influence over their daily lives. The revival of Gothic Art was, in short, an assertion of moral principle.

The "rigorous teachers" who "seized our youth" have gone or teach no more. Of the band of workers who strove to revive our national art on the ancient lines but few—too few—remain. What the final judgment of posterity may be upon their labours we shall not here attempt to estimate. But this much may at least be said—that their aims were noble, and that what they achieved, or attempted, with all its shortcomings, did in a very special manner "make for righteousness."

E. I. B.

The British Museum.

It is quite clear that as time progresses, and the varied collections of that vast national storehouse of curiosities the British Museum continue to increase, those collections must be shed, one by one, and formed into separate and individual museums, just as the unwieldy accumulations of natural history objects were removed in the early eighties and finely housed in a magnificent series of buildings set apart for them—the Natural History Museum at South Kensington. Space is not elastic, and as in the very nature of things the various departments of the great institution in Bloomsbury are continually adding to their store, congestion becomes the rule, and opportunities for making proper educational displays of the different subjects (which, after all, is the real reason for the very existence of museums) grow fewer. At the British Museum such entirely independent departments as the

ENTRANCE, PAKENHAM MANOR HOUSE. DRAWN BY H. F. WARING.

Library, Greek and Roman Antiquities, Prints and Drawings, Egyptian Antiquities, Manuscripts, and Oriental Antiquities—to leave out of the question the minor collections of China and Pottery, Bronzes, and Coins and Medals—are housed. Of these, the Library and its satellite the Newspaper Department are easily first in the demand for space, and, because of the appalling rate at which books and printed matter are accumulating, the Trustees of the Museum have deposited a Bill in Parliament giving powers to them for the disposal of surplus printed matter in general and files of provincial newspapers in particular. It is a remedy suggested by desperation at the prospect of being hemmed in; but the true method of relief is rather by the way suggested, of finding a home, as occasion arises, for one department after another, even though in the last resort the British Museum should finally become the National Library, and all its other constituent parts become separate and independent institutions, dispersed over London. Such an evolution when it comes will make for the thorough development of every subject which is now cramped for want of floor space, and will be to the advantage of the Library as well. The Printed Books Department, as it is officially known, is the greatest of all the divisions of the Museum, and it and the Reading Room could not fairly be removed from this central situation. The Department of Prints and Drawings, on the other hand, seems slightly out of place in Bloomsbury, and a more fitting home would be at South Kensington, among the Science and Art Collections, or attached to the National Gallery. The various departments of antiquities present a more difficult problem, and suggest a national collection of sculpture and architectural examples, with a home of its own in which the Tufton Street collections, those of the Royal Institute of British Architects, and those of the other scattered and individually fragmentary museums might advantageously be brought together under one roof. The cost, although great, would not eventually be much greater than that of continually enlarging the heavy classical pile of the British Museum itself. There can be no doubt that the style imposed by the existing buildings upon all additions is one absolutely unsuited, under such grey and lowering skies as ours, to the favourable display of exhibits; and besides being the style of architecture which, next to the Egyptian, admits least light, it is also the one which absorbs most space on mere walls and corridors. Of course, we are committed to extensions of the British Museum for a long while to come, for to the end of enlarging the gloomy pile the Trustees, a few years ago, purchased much house property to the rear and at the sides from the Duke of Bedford; but the question of separate establishments for separate subjects seems bound to arise now that the Natural History Museum has developed so finely from the poor show its collections made here. Professor Flinders Petrie, who has lectured recently on a "National Repository for Science and Art," has a somewhat different, and a very much bolder, ideal than any we care to set up. It is magnificent, of course, but scarcely within the range of practical social politics. He would have the authorities find a suitable square mile of ground at the distance of not more than an hour's journey by rail from town, and there he would have them build galleries for the lesser collections. In about fifty years time, the natural growth of London would have brought this offshoot of the British Museum within the future suburban era, and things would thus automatically adjust themselves. But imagine the despair of the students compelled in the meanwhile to undertake this, at the least of it, thirty miles journey for the purposes of study! A. B.

On Reflection.

Clerical Logic. A MEMORIAL signed by a number of well known architects has recently been presented to the Dean of St. Paul's, protesting against the damage to Wren's work by the so-called decorations now being carried out there. We have previously stated our opinion of these decorations, which are not only entirely at variance with Wren's work but do not even agree with the earlier set of mosaics in the spandrels of the dome. The reply of the Dean is instructive. After stating that the memorial will be considered at the next meeting of the Chapter, he goes on to say:—"I regret to notice that so far as I can remember not one of those who sign the address has shown his interest in the decoration of St. Paul's by subscribing to the fund raised for that purpose." Is this the sole argument that the Dean and Chapter can use in their own defence? The same reply has been delivered to every petition presented since these decorations were commenced. But can the Dean and Chapter be so sure of their facts? Collection boxes for the Decoration Fund are placed all over the Cathedral, and if a contribution is to be the sole qualification to the right and ability to criticise then every man who places a penny in one of these boxes is, by the admission of Dean Gregory, in a position to call the scheme into question. Can he be so sure that the latest memorialists have not contributed through the medium of these boxes? It does not seem to have occurred to the Dean that these gentlemen can take a greater interest in the scheme by placing their knowledge and abilities at his disposal than by making a cold cash contribution. Further, any cash contribution must necessarily defeat their own avowed purpose, for it places in the hands of the Dean and Chapter the power to carry out more of the decorative scheme which these architects believe to be entirely inimical to the genius of the builder. Not content with employing a Gothic architect to design the reredos, the Dean and Chapter have handed over the decoration of the Cathedral to a man who is out of sympathy with Wren's work, and now we are reaping the inevitable results. We are condemned already for much of the architecture which appears in our streets; but that men who claim a knowledge of art should permit the destruction of one of the masterpieces of the English Renaissance stamps this generation for all time as a generation of vandals, gifted in ignorance and self-sufficiency. There is only one course to be taken, and that is to stop the supplies, and we appeal to all intending subscribers to withhold their subscriptions, however small, until the Dean and Chapter call together a committee of architects and artists possessing a knowledge and love of the English Renaissance to conduct and take charge of the further progress of the work.

A Foretaste of the Millennium. IT is often said that among the most notable characteristics which the closing years of this wonderful nineteenth century (down! twentieth centuryites) will carry into history the extraordinary development of great industrial combinations will stand out prominently as a distinguishing mark of the age. The present, from the business point of view, is more than anything else an era of "trusts," "combines," and great aggregations of capital. The tendency of the day is toward combination in the industrial and commercial world to a far greater extent than ever before. This fact is obvious, and is not in some of its aspects to be rejoiced over. But another bias has developed which is of a far more gratifying character. The growing recognition which is accorded to the principle of arbitration of matters in dispute, whether between nations, bodies of men or individuals, is pregnant with more of hope and promise for the coming century than, perhaps, any other feature of the times. It is not to be expected that wars and labour conflicts and bitter private strifes will vanish from the earth within the next few years or the next century. That would mean the advent of the millennium. But a tendency toward the peaceable settlement of disputes is becoming more and more marked, and it is not too much to claim that the principle of arbitration has already secured acceptance to an extent that will at least mitigate the bitterness of those labour conflicts which have done, and are even now doing, so much to hurt the best interests of both employer and employed, and which keep alive an unnecessary and useless antagonism between labour and capital. Both parties have to learn that in every dispute there is ground for arbitration. Two knights once fought a long and bloody battle because one said a shield was red and the other maintained it was black. After nearly killing one another, it was discovered that the shield was painted red on one side and black on the other. So there are two sides to every question, and in matters of dispute each party should remember that both he and his opponent may be right, judged from their respective standpoints.

"Restoration" once More. A SHORT time ago Mr. Thackeray Turner, the secretary of the Society for the Protection of Ancient Buildings, drew attention to the fact that the interior of Westminster Abbey was being gradually darkened by the introduction of modern glass in some of the windows. As we pointed out in a recent issue, the popular practice of putting new memorial windows in old buildings is quite wrong if the necessary harmony between the two is not considered, glass being simply ordered "per catalogue." Now Mr. Turner draws our attention to what has been and is still going on at Chichester Cathedral, which, he says, "is fast being lost to us." Of course it is the restoration he complains about. In November, 1897, his Society pointed out the risk of building a new north-west tower, which afterwards proved the source of such anxiety owing to the cracks in the west front. The restorers now ask for funds to allow the modern west window to be "replaced by a treatment more in harmony with the thirteenth century work," but the fact which rather shakes the faith which might be extended to those who are now in charge of operations is that they condemn the work of the previous restorers and are replacing it with their own; and by the time they have done Mr. Turner is convinced that the front of the cathedral, with its new tower, will be nothing more than a modern duplication of the old—which means that all interest in the front will be lost. Sir Gilbert Scott's reputation as a restorer is not one to set up as a model for others to copy; but it was Scott who undertook the rebuilding caused by the collapse of the spire of the cathedral thirty-nine years ago. It is certain that the present restorers have little respect for their predecessor, and this case clearly shows that restoration to be worthy of approval must not consist in wholesale rebuilding, and that the greatest consideration should always be given to the selection of the architect in whose hands the work is placed. We all know what happens when the doctors disagree. Scott wiped out parts of Chichester Cathedral and now *his* work is being wiped out—facts little likely to inspire confidence. A writer once said: "The history of the Cathedral of Chichester is to be learnt chiefly from the study of its architectural details." Taking the excellent principle enunciated in this sentence, it would seem that the historian's words would now be "Chichester Cathedral was begun in 1896"! *Verb. sap.*

THE ARCHITECTURAL ASSOCIATION TOUR, 1900.

THE headquarters of the Association were this year made at Bury St. Edmunds, which in itself is a most interesting town, boasting many historical events, whilst the buildings and villages in the neighbourhood, both from an architectural and a picturesque point of view, call for admiration.

In Bury itself perhaps the chief feature of interest is the Abbey Gate, which was the main entrance to the monastery. This is good Decorated work and was finished about 1377. Through this arch the abbey ruins remain to show what a vast place this building was at one time, though they no longer have much interest to the visitor, owing to their present decayed state. The Norman Tower, close to St. James's Church, was built in 1090, and is an excellent specimen of work of this period, while the

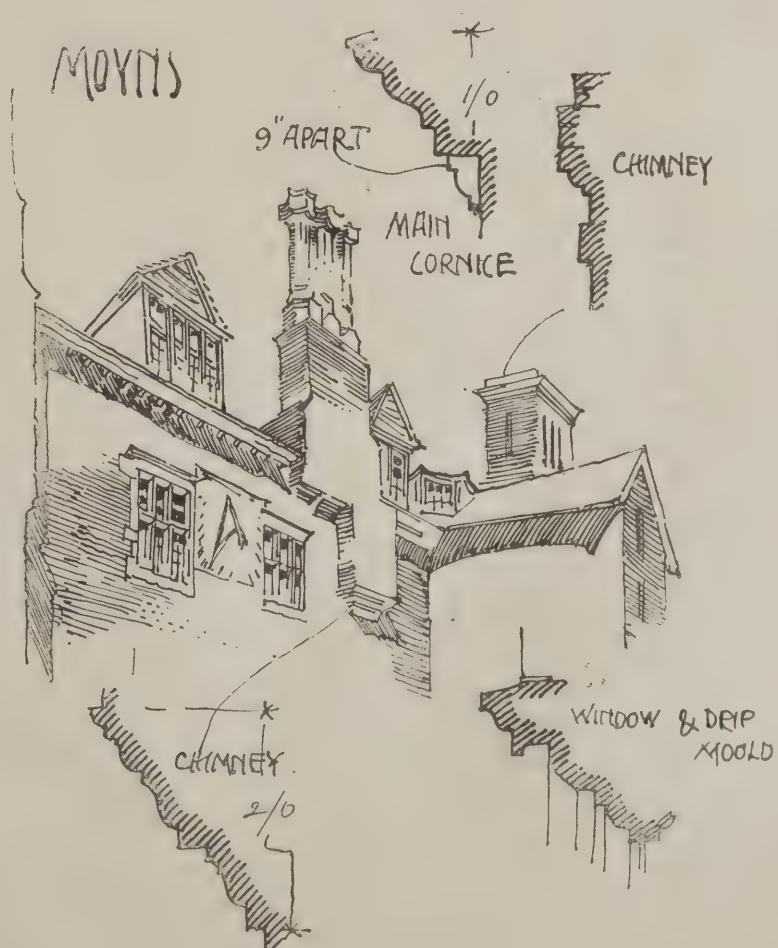
Perpendicular church of St. James and the church of St. Mary are equally interesting. Some good wrought-iron work is also to be seen here.

The first day's programme included visits to Pakenham Manor House, Ixworth, Bardwell, and Norton House. At Pakenham the Association was most hospitably received by the owner. This is a typical manor house of red brick and stone dressings, and bears the date of 1622 upon the porch. The three equal gables in the front of the house are most pleasing, and show how effective these features may be made when used with discrimination. The porch projects about 7ft. or 8ft., and is in the form of a semi-octagon. An interesting ceiling in the drawing-room was noticed.

The church at Ixworth, a few miles further on, belonged to the Abbey of Bury, and is almost entirely Perpendicular. The tower is noticeable chiefly for its flint work and the panels in the buttresses. The porch was commenced in 1470 by the Abbot. In the village, which once boasted an Augustinian priory, are one or two typical plaster houses, the ornament on these in plaster being often of the most primitive description.

Bardwell Manor House was mainly admired for its simplicity, the ornament being confined for the most part to the chimney stacks. Stowlangtoft is interesting for some good monuments in the churchyard, whilst two or three cottages appealed to the artistic tastes of many.

Norton Hall, a stucco building, whilst not possessing a remarkable exterior, has inside many features of interest to architects and antiquaries. The house was considerably restored 100 years ago. The ceiling painting by Tillemans in 1720 is excellent, whilst the carving of the overdoors and friezes excited universal admiration, as did also the staircase.



HOUSE IN IXWORTH VILLAGE. DRAWN BY H. F. WARING.

Pictures and rare *objets d'art* fill the rooms, and regret was felt when the carriages arrived to take the party away.

The famous Moyns Park was the scene of the first visit on the next day, and here was seen to the best advantage an ideal country house. This is a fine old Tudor mansion, built partly in 1580 by T. Gent. The huge stacks of chimneys, with their wonderful ornament, the well-proportioned windows and the simple little gables, the whole weathered to delightful colours, made a picture calculated to arouse enthusiasm in the most *blasé*.

The most interesting feature in Clare village is the old plaster house, which, however, is more curious than beautiful. Driving on, Cavendish presently appears. The church, standing behind old thatched cottages and backed by trees, makes a charming picture, which induced many to put their impressions upon paper. Risby, a halting place on the following day, has a church with a curious tower and an old house, which is perhaps the more interesting of the two buildings, and here is seen a good specimen of the heavy cornice, with its deeply-recessed plaster cove.

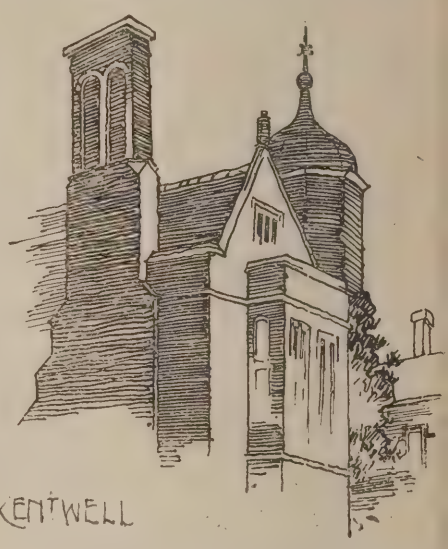
Mildenhall reached, the church is first visited. This is dedicated to the Blessed Virgin and is decidedly interesting. The chancel is principally Early English, the nave Perpendicular. The window of seven lights, with good tracery, has Early English banded shafts of Purbeck marble. The chancel arch is very fine and has good mouldings and tooth ornament. A small chapel is seen on the north side of the chancel, of Early English date. The splendid carved-wood roofs of the nave and aisles were especially noticed: the subjects are taken from the Scriptures, whilst angels with outspread wings form the hammer-beams. The font is Perpendicular. The north porch is large and interesting, with a groined

DRAWN BY H. F. WARING.

DRAWN BY H. F. WARING.

roof of stone and a room over it, the doorway of which has the Annunciation carved in the spandrels; the exterior of this, and of the north aisle, is good and highly enriched Perpendicular, with flint and stone panelling and niches in the buttresses. The Market Cross of oak is an interesting little structure of Perpendicular date. Close to the church is the Manor House, built in the beginning of the seventeenth century. This building has, however, been somewhat marred by restorations and additions. It is now used as a training school for priests.

After a short drive, Icklingham is reached. The church of All Saints is of interest, especially a pavement of Roman tiles found in the parish about thirty years ago. This church is almost all Decorated work.



West Stow Hall, next seen, is an old brick mansion, and belonged to the Abbots of Bury until the Dissolution, when it was granted to Sir John Croftes, who had belonged to the household of Mary Tudor, Queen Dowager of France and Duchess of Suffolk. Sir John built the hall and gate-house. In the upper part of the house are some interesting distemper paintings of the time of Elizabeth. This gate-house, which has flanking towers finished with cupolas, is perhaps the most interesting part of the building. Most of the quadrangle of the house is pulled down, and the remainder is used as a farmhouse; but many details are left which are well worth studying—notably, the chimneys, arcading, and two gate piers.

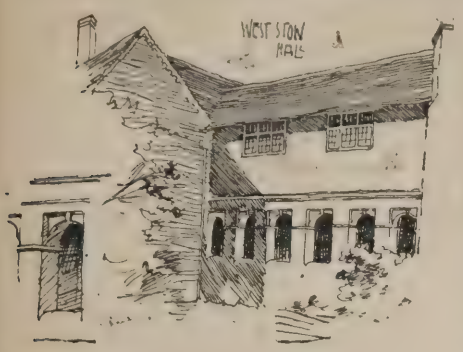
Hengrave Hall is indeed worth a visit, and is said to be one of the most interesting examples of a Tudor mansion remaining in England, although by the removal of the outer court and of other portions of the building the house has been very greatly reduced in size. It was begun by Sir Thomas Kytson about 1525, and completed in 1538, and was one of the first of those grand English homes which wealthy merchants were beginning to construct at this time. The house, which is built round an inner court, is of white brick with stone dressings. The gate-house and the whole of the main front are the most enriched portions and are well preserved. Gothic and Renaissance details are used together with a somewhat curious result in the gate-house. The Kytson crest, a unicorn's head erased, appears in the spandrels of the archway. The large central shield in the lower part of the oriel has the arms of France and England quarterly. The best view of the house is at the south-west angle. The interior of Hengrave has been greatly altered since the reduction of the building in 1775. The inner court, however, is still surrounded by a cloister, in the windows of which are many shields of arms in stained glass; and in the chapel is a good window of Flemish glass, with twenty-one subjects, ranging from the Creation to the Final Judgment.

Hengrave Church, which is close to the Hall, was rebuilt in the first years of the fifteenth century, but has been altered considerably. The round tower at the west end is considerably earlier than the church itself, and it is probably of Norman construction. Several tombs are interesting.

The next day (Thursday) train was taken to Long Melford, which is a pleasing little village. In the fifteenth century it was the seat of a flourishing clothing trade, but this has now vanished. Melford Hall, on the east side of the green, formerly belonged to the Savages, but is now inhabited by the Parkers. It is an Elizabethan house and was at one time surrounded by a moat; it is built of brick with stone dressings. The Abbot of Bury, in whose gift was the living of Melford, had a summer residence on this spot, which, after the Dissolution, was granted to Sir W. Cordell. In 1578 he entertained Elizabeth here, and by his "sumptuous feasting and bankets" "did light such a candle to the rest of the shire" that Her Majesty with her "traine" returned greatly "content."

The beautiful church of the Holy Trinity is certainly worthy of a visit. It is chiefly Perpendicular, and is entirely composed outside of striped flint and white stone. The tower is now being restored in similar material under the direction of Mr. Bodley. Around the building, under the battlements and over the windows, run a series of curious inscriptions, formed chiefly of inserted flints, but much defaced, recording the names of the various benefactors. The interior of the building possesses a great deal of dignity: a lofty clerestory runs round it, supported by small piers, the spandrels filled in with enrichments. The north and south aisles have each a low chapel annexed to the east

end and ranging with the east end of the choir. The sedilia and the flat oak roof should be noticed in this small chapel.



Kentwell Hall, lying close by, is a very good specimen of an Elizabethan house, and it has the great advantage of being almost free from the hands of the restorer. On plan it is in the form of an E, and is surrounded by a moat. The house was built by the last but one of the Cloptons and is approached by a splendid avenue of lime trees.

Lavenham, once a flourishing little town, still shows traces of its former prosperity in its rich old houses, but these for the most part present a tumble-down and uncared-for appearance. The "Moot House," an excellent specimen of half-timber work with its carved cornices and brackets, is notable. A quaint stone cross stands in the market p'ace, which possesses a certain dignity. The hand looms form an interesting feature of the town; they are to be seen in every cottager's room.

Standing upon an elevated site is the church of St. Peter and St. Paul, which is an exceptionally imposing building. It has a lofty clerestory and a massive tower, one of the finest in the county. It is Perpendicular throughout and is much enriched, especially the battlements. On the south porch are carved the boar and mullet, the bearings of the De Veres, lords of the manor from the Conquest, and placed here in honour of John, fourteenth Earl of Oxford, who is supposed to have erected the church in conjunction with members of the family of Spring between 1480 and

DRAWN BY H. F. WARING.

1530. The oak roof should be observed, with the arms of the De Veres; and the elaborately-carved pew of the Spring family, the curious and grotesque carvings of the stalls, the rood screen and the screens which divide the chancel from the side chapels—all are interesting. In the chancel, which has a Decorated English window, is an alabaster wall-tomb with kneeling effigies of Henry Copinger, rector (who died in 1622), and his wife. There is also a simple but curious small "brass" in the vestry to Thomas Spring (1480), one of the clothiers who are supposed to have begun the rebuilding of the church, which his son completed. The tower has been left without its pinnacles. Round the top are shields with the arms of Spring. A house in Prentice Street has some good Elizabethan ceilings, and one in Water Street of Perpendicular date has a winding staircase formed out of solid brickwork. Hawstead Church, visited the following day (Friday), is of flint with the usual stone dressings, and inside are seen Norman doors and arches. A good rood screen, upon the south side of which still hangs the sanctus bell, attracts attention. On the chancel floor are brasses for Roger Drury, 1500. Mention must be made of several excellent little memorial tablets which have recently been placed in the church from the designs of Mr. Warren.

A drive from here of three or four miles brings into view Coldham Hall, which was an ancient residence of the Rokewodes. The present house was built in 1574 by Robert Rokewode, and, notwithstanding the stucco which is used somewhat freely, is decidedly picturesque. Inside is some good woodwork, notably a gallery. Rushbrooke Hall, close by, (the seat of the Rushbrooke family) is a large red-brick moated Elizabethan mansion. Externally the dormer windows and chimneys perhaps are most noticeable, whilst inside a splendid oak staircase well repays a careful study. The Hall has many pictures of merit: the most important are a full-length portrait by Vandyck of Henry Jermyn, Earl of St. Albans, and a full-length portrait of Lord St. Albans by Lely.

The excursion was a most satisfactory one, and all enjoyed the week so profitably and instructively spent.

New Chapel at Upton Asylum.—The Cheshire County Council are obtaining plans for a new chapel it is proposed to erect in consequence of the large number of Protestant patients. The building is estimated to cost £6,000.

St. Andrew's Mission, Beaufort, under the charge of the Rev. Hugh Phillips, has been so successful that it has been found necessary to enlarge the church by the addition of a chancel and to provide a parish room for social and other gatherings. In order that there might be no delay, the curate in charge invited the male portion of his flock, chiefly colliers, to prepare the way by digging out the soil for the foundations. The appeal met with a ready response, and for some weeks they have devoted four hours every evening to the work after their return from the pits, the curate sharing their labours. The average attendance each evening was thirty, and eventually about two hundred tons of rocky soil were removed, a portion being utilised in levelling the churchyard. Building operations will be commenced as soon as funds are provided.

ROYAL INSTITUTE OF PUBLIC HEALTH.

ANNUAL CONGRESS AT ABERDEEN.

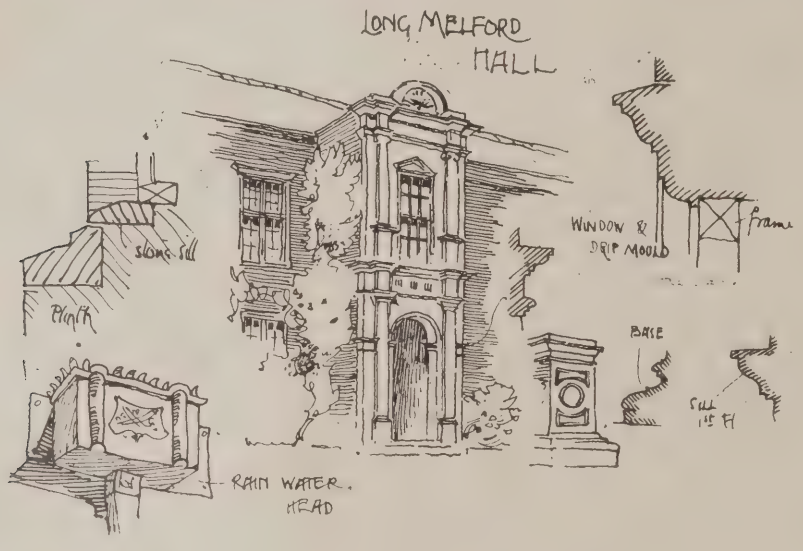
THE annual congress of the Royal Institute of Public Health opened at Aberdeen on August 2nd and closed on August 7th. The meetings were held in Marischal College, and about 800 members from various parts of the United Kingdom attended.

Lord Aberdeen, in the course of his presidential address, reviewed the progress of sanitation, especially as represented by legislation upon the subject. He remarked that it was exactly 100 years ago since the first enactments were passed which could be described as the direct ancestry of modern sanitary legislation. The earlier Factory Acts, designed especially for the protection of the children, might come under this category. Another kind of legislation which advanced concurrently took its origin in the necessity which had to be faced in crowded communities for an organised supply of water, as distinguished from independent and casual pumps and wells. So, too, with sewerage. The measures dealing with these elementary needs were the parents of our local sanitary Acts as distinguished from the factory class of legislation, which had throughout been administered under the authority of the Home Office. It would be difficult to over-estimate the importance of the new kind of administration as a whole, not merely in regard to its direct remedial operations, but as to its indirect and suggestive influence in education and enlightenment as to health arrangements. There had been a great and growing advance in sanitation, but, reviewing the whole position, there was no cause for complacency. Contemplation of what had been accomplished, however, often in spite of prejudice and many obstacles, might assuredly give ground for encouragement and confidence as to future progress and attainment resulting from careful and persevering effort in dealing with the problems which still confronted sanitarians. Amongst these was overcrowding, and from every point of view—religious, moral and humanitarian—there was crying need for the alleviation of that evil. Happily, public attention was being increasingly drawn to the subject, and a certain amount of reform had been attempted, but they must feel that the subject had yet to be grappled with in all its complexity and magnitude.

Principal Marshall Lang (Aberdeen University) moved a vote of thanks to Lord Aberdeen for his address, and Dr. Kingsbury (Mayor of Blackpool), Dr. Farquharson, M.P., and Sir C. Cameron, M.P., spoke in support of the motion.

In the afternoon the different sectional meetings were held.

Dr. Farquharson, M.P., as president of the section of municipal and parliamentary hygiene, urged that the powers of County Councils should be so enlarged as to include a large measure of home rule and avert costly parliamentary contests, and that the members should have their expenses paid. A discussion on the registration of plumbers followed, and a resolution was unanimously passed in favour of compulsory registration.



The Architecture and Engineering Section

opened its sittings under the presidency of Mr. John Honeyman, R.S.A., architect, of Glasgow. Mr. Honeyman, in his opening address, spoke of the science of construction as the oldest of our sciences, and they could frankly say it

showed no signs of decrepitude, but kept well abreast of the sister sciences in works of beneficence. Comparing the rude times of the aborigines with such works as the houses now being built in our great cities, or with the stupendous works now being carried out in the valley of the Nile, they were impressed with the enormous strides which construction had been making in recent years. On the engineering side the chief works connected with health were water-supply, drainage, sewage disposal and the disposal of the refuse of the towns; Mr. Honeyman dealt at length with the disposal of the sewage which found its way into the Clyde. The question of the proper ventilation of the dwelling-houses of both rich and poor was also being forced upon them more and more, and the most was being made of fresh air and other hygienic agents. A cesspool might be one of the best of Nature's cleansing departments, and they were losing sight of proper ventilation in the erection of the later class of houses, which had not the airiness of ancient structures. In the houses which were built to hold together only to sell they found the unintentional method of ventilation, but of the very worst description, because the ventilation was chiefly low down, from the floor. He had often been in a crofter's cottage where the walls were low and the windows small and not meant to open, and he never had the consciousness of any bad odour there. In many of the two-room houses which they entered the offensive smells made them beat a hasty retreat. He attributed the good health of the crofter and his wife, to whose cottage he referred, and who had reared there a family of ten, to the unintentional system of ventilation, the walls of the cottage being built dry and the air getting access to the different rooms in all directions. The only other house he remembered to have been in that was as well ventilated was a house of a very different kind—the house of Lord Kelvin. The ventilation there was intentional, and worth referring to as providing suggestions. Mr. Honeyman

described how the air in the house was heated by a powerful stove, the air then finding its way into the different rooms through arrangements at the top of the doors, and in such a way as not to cause the slightest discomfort. A most important subject they had to deal with was the health of their large cities, the death rate in some of which was abnormally high. The want of houses cheap enough for the poorest class was really at the bottom of it, because if the poor could not get houses they shared them with others to pay the rent, and swelled the system of taking in lodgers. But even though they had enough of these houses, they had a great deal to do to instruct the occupants how to act. Their habits were also at the root of the immense amount of mortality. Of course there was no difficulty about the housing of the artisans: it was with the very poor. Drunkenness was the greatest obstacle they had to sanitary reform, and the death rate was more increased by this and its consequent misery in the course of one year than in the course of ten by all the defective drains and defective plumber work. Mr. Honeyman concluded by referring to the architecture of Aberdeen, and said that, looking at the building in which they were assembled, they could congratulate the citizens of the Granite City that

A. A. TOUR, 1900. DRAWN BY H. F. WARING.

the power of her traditions seemed still to survive, and that they had still among them the Gibbs, Simpsons, and the Smiths of bygone years.

Mr. James Souttar, F.R.I.B.A., Aberdeen, read the first paper, which was upon "Architecture and Hygiene," and indicated some of the many ways in which architects might affect the health of our cities. He divided his subject into two parts—architecture applied to the hygiene of the house and architecture applied to the hygiene of the city—and held it was possible to build a healthy house almost anywhere.

The next and final paper for the day was on "The Architecture of the Twentieth Century," by Mr. Banister F. Fletcher, A.R.I.B.A., London, which was entirely an ideal paper, and was more or less an attempt, as he said, to look into the future.

The discussion of this paper was resumed on the next day.

Mr. Cecil, London, said there was one point on which Mr. Fletcher invited discussion: that was the use of gas stoves. He was perfectly sure it was possible to use gas stoves for heating and cooking without any injury to health, and he was also perfectly sure that there were immense numbers of gas stoves in use which were hostile to healthy conditions. Unless perfect combustion was ensured, the general promiscuous use of gas stoves would be dangerous to health, not in the way of fatal illness, but in the lowering of vitality, which rendered the body more susceptible to attacks.

Mr. Riddell, Suffolk, thought that something might be done in the way of improving the roofing of houses.

Councillor Cooper, Aberdeen, stated that recently there had been introduced into Aberdeen the Mansard roof, but the common complaint was that it was extremely cold in winter and very warm in summer. He was sure if they were to improve upon anything in the twentieth century it would be the adoption of some arrangement to take the place of these Mansard roofs.

Mr. Fletcher explained that the adoption of Mansard roofs was for the purpose of giving practically square rooms without the expense of walls; but he agreed with Councillor Cooper that such objections were urged against them.

Mr. R. Morham, city architect of Edinburgh, contributed a paper on "Suggestions on Fever Hospital Construction." In the first place, he alluded to the generally conceded need for fever as distinct from general hospitals, and he went on to point out the need for employing competent architects; the desirability of supporting the architect with ample but not extravagant instructions; of the distinction between ordinary and fever patients. After dealing with the staff quarters, kitchen, dining-room, store, dispensary, and laundry blocks, he concluded by pointing out that the object in view in all such institutions was to do the best possible for the patients durnig the period of their illness and for their comfort and recreation during convalescence.

Dr. Skinner, Willesden, said it was important that each ward should be large enough to accommodate a sufficient number of patients for a nurse to take charge of. He thought this was a better arrangement than having two smaller wards.

Mr. Morham said he agreed with Dr. Skinner. In a large hospital it was always desirable that the wards should be large enough to give employment for one nurse; but in small hospitals this could not always be done.

An Ideal Workman's Cottage.

Councillor Cooper, Aberdeen, read a paper on "An Ideal Workman's Cottage." His proposal, he said, was of a practical character, relative to the housing problem as it affected local authorities at the present time, and which, if it were carried out, would enable them to remove the necessity for a large section of the workers living in tenement houses, and would also in some measure prevent the overcrowding which manifested itself in every growing centre of population. The Legislature having affirmed the principle that public funds may be employed and the public credit utilised to provide properly equipped sanitary houses for working people, the question confronting them was what particular kind of house or houses might be erected to meet the needs of the case. He thought that real progress was more likely to be attained in dealing with the housing problem by keeping in view the ultimate objects for which sanitary science existed, rather than by seeking to satisfy the clamant and immediate wants of any single section in the mere matter of low rents. Neither the block buildings nor the tenement or flat system had been found to answer all that was desired in the interest of the whole community. In Aberdeen, where the popular working-class house took the form of a tenement for six or eight tenants, there were indications that in districts of the city where streets of such houses had been built these houses within a short space of time began to reveal most of the features of the slum. Passages became dilapidated, staircases were neglected, and in back-yards filth was allowed to accumulate. The fact was that too many people were crowded together under one roof, and although it might be set down as everybody's business to keep the place in order it was really nobody's business in particular, and very soon the place wore a broken down aspect, and would very likely be shortly occupied by a class of tenants more careless than the present ones, and would by and by become a district to be dealt with under a clearance scheme. The Aberdeen Town Council had erected workmen's houses on a piece of unoccupied ground near the centre of the city, the rents of which varied from £5 5s. to £9, while additional buildings of a different type were being erected on the remainder of the ground. There could be no hesitation in coming to the conclusion that the ideal scheme was that of cottages on the outskirts of the cities; and in what he had to say he wished it to be kept in mind he was confining himself to local circumstances. It was a point of the greatest importance that the city had now got possession and control of the tramways, and it would not be surprising if the Town Council were to join other cities in coming to the conclusion that to provide cheap means of transit and to use the tramway for the development of the outlying districts of the city, and also to provide cottages with small gardens attached, was the best solution of the housing problem. It would not suit the purpose in view if space was not afforded for a garden, which not only prevented the congestion of air space, but afforded a profitable and healthy recreation to the occupants and was the best way of stimulating an interest in life and home. They had almost every kind of cottage in the city of Aberdeen, but the cost of building was so great that they were beyond the reach of the working class, renting as they did from £18 to £40 and £50.

A Proposed Plan.

The plan he had prepared consisted of a single cottage with ground floor and attics, comprising a living room, parlour, and four bedrooms, with scullery, bath-room, and a back wing. It was a Scotch custom to prepare and eat food and to sleep all in one apartment, but in his plan the bed in the kitchen was done away with, and a number of small bedrooms provided, after the English type of workmen's houses. After describing various plans in the internal arrangement of the houses, he said he thought that municipalities might with advantage purchase suitable ground and build their cottages in detached blocks of, say, two, three, and four cottages, some of them with and others without a back wing. If this were done, some artistic taste could be shown in the laying-out of the ground, and a considerable saving effected by reducing the number of exposed gables. As to the cost of these cottages, the figures he could give would be of little value, the cost of building differing so much in different towns and at different times in the same town. Architects of experience had informed him that the cost in Aberdeen, confined to plain rubble masonry, in workmen's houses, ranged from 4½*d.* to 5*d.* per cubic foot. With the lowest of these figures the cost would approximate to £200 without the scullery, and £300 with it. These figures were high, and the Act of 1890 would be of little service to them unless the period for repayment were extended to at least 100 years for both the ground and the building. Of course, the cottages referred to would not serve the purpose they had in view if they could not be let for a rent of, say, £10 and £12 respectively. It was not part of their present purpose to discuss the various means by which such an object should be accomplished. He was convinced that in cities which are not overcrowded the authori-

ties would not be doing their duty if they did not take measures to prevent the growth of an evil which had been fraught with such dire results to the physical and moral welfare of humanity.

Mr. Fletcher, London, said he was afraid the problem was one that could not be solved. It was a question of pounds, shillings, and pence, and philanthropy could not enter into it. A poor man was not a pauper, and unless a cottage could be provided at a price that a working man could pay for it was perfectly impossible to erect an ideal workman's cottage. The whole thing, so far as he could see, seemed to be bound up in the question of easy and cheap transit.

Alderman Price Lewis, Wolverhampton, said he thought the ideal workman's cottage was such as had been stated by Mr. Cooper. The difficulties were largely financial, and the solution lay more in cheap transit that in anything else.

On August 3rd a paper by Lady Aberdeen on

Women as Members of Sanitary Authorities

was considered. As Lady Aberdeen was unable to be present the paper was read by Lord Aberdeen, who explained that it was rather as president of the Women's Local Government Society, which was responsible for the paper, that her name was attached to it. The paper contained some interesting facts regarding the useful administrative work done by women as members of local sanitary authorities, and mentioned that nearly 150 women were serving as rural district councillors in England, while women representatives were to be found on 35 rural district councils in Ireland. Hitherto women had done good work on the London vestries, but the new Act which was to come into force in November would exclude them from such work until freedom of choice was restored by an amending Bill. There were three good reasons why women of eligibility should serve on local sanitary boards:—(1) Women had special qualifications for some work which men could not do as well as women nor as fitly, and the very need for some of this work would not be seen until women had an opportunity of pointing it out; (2) even if women were not admitted to have special qualifications, the community was entitled to choose its servants; and (3) to secure the conditions necessary to the public health it was essential to exclude the co-operation of none.

On the suggestion of the president, it was moved by Mr. James Hay, of Aberdeenshire, and seconded by Mrs. Maurice Dockrell, Monkstown, County Dublin, that Lord Aberdeen be asked to introduce in the House of Lords an amending Bill legalising the election of women under the new London Government Act, and Lord Aberdeen agreed to give effect to the wishes of the Congress.

The Housing Question.

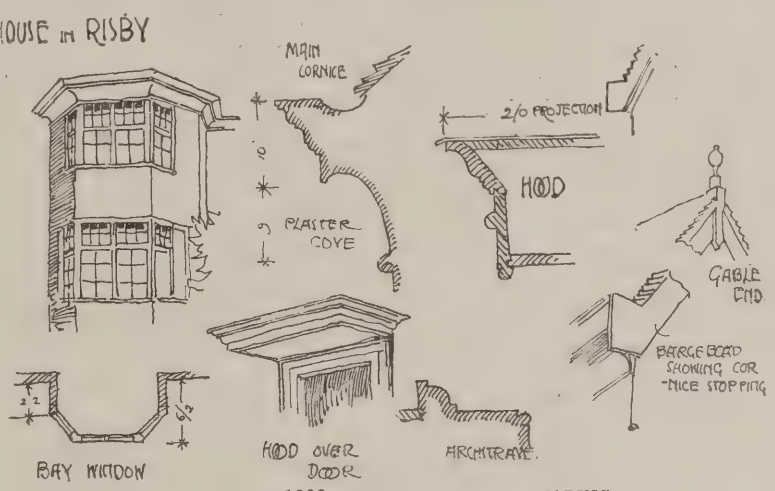
In connection with the question of legal stumbling-blocks in the housing question, Mr. Mansfield Robinson (Vestry Clerk, St. Leonard's, Shoreditch) proposed, and the motion was carried, that the Congress should urge the president of the Local Government Board to introduce legislation forthwith to enable local authorities executing schemes under Part 2 of the Housing of the Working Classes Act, 1890, to borrow the necessary money for reconstructing artisans' dwellings for all the persons displaced by such schemes, seeing that the charge of raising such capital money out of current rates is prohibitive and discourages local authorities from dealing with insanitary areas.

It was also agreed by 37 votes to 30 that the Local Government Board be requested to obtain the opinion of the law officers of the Crown whether it is legal for municipal authorities to erect artisans' dwellings under the Housing of the Working Classes Act, 1890, and charge on the rents the sums necessary for repaying by instalments the capital cost of erecting the dwellings.

In a paper on "Sanitation and Economics" Dr. Beveridge, of Aberdeen, expressed the opinion that the proposal to make workmen proprietors of their own houses would not yield beneficial results, because, owing to want of capital such owners would not be in a position to keep the houses in a thoroughly sanitary condition.

A paper was read by Councillor Dunlop, Glasgow, entitled "A Plea for More Air Space in and around Town Dwellings," and the following motion was passed: "That this Conference approves of the standard of air space for dwellers in cities and large towns being raised to 500 cubic feet for every adult and 200 cubic feet for each child under ten years of age."

Saturday, August 4th, was devoted to excursions.



Professor Frankland on Sewage Purification.

The sittings on Monday were restricted to business connected with the conference of medical officers of health, sanitary inspectors, and veterinary surgeons. The principal address of the day was delivered to all the members of the Congress by Professor Percy F. Frankland (Birmingham), on recent developments in the purification of sewage. Lord Aberdeen occupied the chair.

Professor Frankland described the methods of purification employed at Birmingham and gave a detailed account of his experiments in connection with the disposal of Manchester sewage. These latter, he said, had altogether exceeded their expectations as to the possibility of purifying manufacturers' sewage, particularly by the use of a system of multiple contact. He deplored the apathy of corporations who built libraries and undertook public works but refused to consider the advisability of clearing away pollution because science could not make the sewage profitable. To expect science to show how money could at all times of the year be made out of town sewage was, in our climate, as unreasonable as to ask her to devise a means of lighting a town with electricity by utilising the waste heat which escaped from the bodies of the inhabitants. All the great developments in the purification of sewage, chemical precipitation, irrigation, intermittent filtration, and the bacterial treatment, including septic solution, were essentially British, although we were deeply indebted to America for the extraordinary diligence with which some of its men of science had conducted a truly monumental series of experiments demonstrating the great possibilities of intermittent filtration. Whilst, therefore, we might be justly proud of the great fertility of resource which had been exhibited in this country in dealing with the sewage problem, it was a matter for humiliation that there was in the whole British Empire no organisation whose duty it was to carry out extended experimental enquiries on sanitary subjects on the scale and with the thoroughness adopted by the Massachusetts Board of Health. All scientific investigation in this country was carried on under extraordinary difficulties, and with little or no encouragement of any kind; frequently at the private expense and even on the private premises of the investigators, in hours or even odd moments snatched from a life of arduous duties of a routine character by means of which the daily bread was earned. They all knew how much was gained in efficiency through combination, which was the watchword of the hour in the commercial world, and there could be no doubt that a similar increase in efficiency and in unexampled advance would result from combination in scientific enquiry. We were beginning to realise in a number of directions by bitter experience that our methods were too casual and that we were losing ground through the tenacity with which we adhered to insular traditions and prejudices, which placed us at a disadvantage in the competition with the concentrated and organised efforts of neighbours who displayed greater elasticity and power of adaptation to the kaleidoscope of circumstances. In no department of life was this more true than with regard to our position in the world of science, for, high as was undoubtedly the quality of some of the scientific discoveries which were made amongst us, in point of quantity of output we were lamentably deficient through the absence of organisation, the lack of adequate encouragement and of the provision of opportunity. He considered that the Government ought to give to science in this country the position of influence and authority which it already occupied in almost every other civilised land, and that the objects of that section of science which that Congress represented should be furthered by the creation of a great Imperial Board of Health, under the auspices of which scientific enquiries of the highest value should be systematically prosecuted in all directions.

Dr. Farquharson, in moving a vote of thanks to Professor Frankland, supported the idea of the establishment of a Government Board of Health.

In the afternoon the delegates enjoyed a garden party, and the usual Congress dinner took place in the evening under the presidency of Lord Aberdeen.

A. A. TOUR, 1900. DRAWN BY H. F. WARING.

The Fifth International Congress of Architects was begun at Paris on July 30th, when a resolution favouring copyright in architectural designs was passed. On July 31st an excursion was made to Chantilly. On August 1st, papers having been read on the subject of architectural education, a resolution was passed that in every country the higher study of architecture should receive the greatest possible development. A visit was afterwards paid to Sorbonne. On the 2nd inst. a resolution expressing the desirability of a complete inventory of existing monumental remains and a uniform law for their preservation was passed. Afterwards a resolution was carried to the effect that all Governments should take measures to protect and render respected the title of architect, by reserving it in future for qualified persons. Mr. Locke, secretary R.I.B.A., contributed a summary of the work of the recent congress in London, and papers were read on "Habitations à bon marché." On August 3rd papers were read on American skeleton steel construction, and on foundations in hard soil. The Congress ended on Saturday, August 4th, when it was decided to hold the sixth International Congress at Madrid, Seville or Grenada in the Spring of 1903.

Law Cases.

The Sequel to a Fire.—An action remitted from the High Court was recently heard at the Merthyr County Court in which the plaintiffs were Messrs. Thomas and David John Rees, architects, and the defendants, Morgan and Cecilia Griffiths, of the Navigation Hotel, Merthyr. Mr. F. Sydney Simons, for the plaintiffs, explained that the original action was to recover a sum of £28 16s., being the balance of an account of £275, after giving credit for £246 4s. paid, for work done and fees earned in connection with the valuation of the dilapidations caused by a fire at the hotel and with the preparation of the plans and specifications and the getting-out of quantities for the rebuilding of the premises. He now, however, proposed to alter his claim to £104 16s., which, plus the £246 4s. already received, represented £351, being 10 per cent. which the defendants had agreed to pay on the amount obtained from the company in whose office the building had been insured. Mr. G. F. Forsdyke, on behalf of the defendants, raised the contention that the plaintiffs were bound by the particulars furnished in the original action, and that His Honour could deal only with the claim for £28 16s. His Honour agreed, and in the end judgment was given in favour of the defendants, with costs.

Claim for Damage through Extraordinary Traffic.—In the Queen's Bench Division on Saturday last Mr. Justice Bigham delivered judgment in the case of the *Epsom Urban District Council* v. *London County Council*. It was an action brought by the plaintiffs to recover from the defendants the cost of repairing certain roads at Epsom, repair having been rendered necessary through the heavy traffic of the defendants' contractors. In the year 1898 the defendants entered into contracts with two firms of contractors for the erection of a temporary hospital and the alteration of certain existing buildings at Epsom so as to convert them into a permanent hospital. The sites of both buildings were in the plaintiffs' district, and the contracts involved the carriage of exceptionally heavy traffic along certain roads in the district. The question was whether the defendants were the persons "by or in consequence of whose order" the traffic was conducted. Mr. Justice Bigham was of opinion that the plaintiffs were entitled to succeed on the main question. Another point taken was that in respect of the damage done under one of the contracts—that of Messrs. Kirk and Randall—the plaintiffs could not recover, as the proceedings were commenced too late. The statute provided that the proceedings should be commenced within six months, and therefore on this point the defendants succeeded. The amount to which the plaintiffs were entitled would have to be ascertained. The judge hoped that neither of the parties would spend any more of the ratepayers' money in litigating such a matter. The case ought to be settled. There would be no costs.

Building Without Having Deposited Plans.—Dathan Dickerson was recently summoned at the instance of the Guildford Rural District Council for erecting a building in Manor Road, Stoughton, without first delivering proper plans to the clerk of the Sanitary Authority, in accordance with the Public Health Act. Mr. Cullerne (for the Council) stated that in March the defendant called upon the surveyor and said he proposed to erect a pair of cottages in Manor Road. He showed a pencil sketch, and was then told the forms he would have to go through, and the necessary forms were given him. No plans were deposited up to May 17th, when the surveyor visited Manor Road and found that considerable progress had been made with the erection of the buildings. The surveyor on that day gave defendant notice requiring him to deposit plans within three days, and about eleven or twelve days afterwards plans were deposited. They were submitted for approval to the Council on May 29th, but were not approved, and defendant asked the surveyor for the return of the plans, so that he could make them comply with the by-laws. On June 6th the surveyor found that the works were still in progress and he ordered work to be stopped, which was done on the next day. The amended plans were afterwards sent in, but before they were placed before the Council he found the work again in progress on July 15th. Mr. Anstee, the surveyor, in answer to defendant's counsel (Mr. White), said he believed the plans came from Messrs. Peak and Lunn. Mr. White admitted that the plans were not submitted before the buildings were commenced, but said his client was not aware that the plans were not submitted by the architects. He sent the usual notices and he (Mr. White) put it to the Bench that it was a technical breach. The Chairman said the Bench could not consider it a technical breach by any means: it seemed to be an open defiance of the by-laws. The full penalty of £5 was inflicted, this including costs.

The Approval of Plans by Local Authorities.—The recent appeal case of *Regina* v. *Mayor, &c., of Eastbourne* raised an interesting point. A rule *nisi* was obtained by John Arthur Wright calling upon the Corporation of Eastbourne, as the urban sanitary authority, to show cause why a writ of *mandamus* should not issue, directed to them, commanding them to approve and signify in writing their approval of the building line as shown on the plans sent by John Arthur Wright to the Corporation for the construction by him of a block of buildings for the purpose of residential flats upon certain land adjoining the house called Mixbury House, situated at Hartington Place, in the borough. The Corporation passed a resolution that the plans for the erection of the flats should be approved as complying with the by-laws, but disapproved as regards the building line shown on the plans, on the ground that the flats were shown on the plans as intended to be erected or brought forward beyond the front main wall of Mixbury House, being a house on one side of and in the same street as the proposed flats. This was, in fact, a disapproval of the plans on the ground that the proposed buildings would contravene section 3 of the Public Health (Buildings in Streets) Act, 1888 (51 and 52 Vict., c. 52), which provides that "it shall not be lawful in any urban district, without the written consent of the urban authority, to erect or bring forward any house or building in any street, or any part of such house or building, beyond the front main wall of the house or building on either side thereof in the same street. . . ." The section provides a penalty for every day during which the offence is continued. The Divisional Court discharged the rule for a *mandamus*, holding that, according to the decision in *Smith* v. *Chorley Rural Council* (1897, 1 Q.B., 678), the matter was within the discretion of the Corporation, and the Court could not interfere by *mandamus* with the exercise of that discretion. The applicant for the *mandamus* appealed. Mr. Macmorran, Q.C., and Mr. B. A. Hall, for the appellant, said that by a by-law made under section 157 of the Public Health Act, 1875, plans of new buildings were required to be deposited with the local authority, and section 158 gave power to the local authority to approve or disapprove the plans. The local authority could only disapprove deposited plans upon the ground that they infringed a by-law. The remedy for an infringement of the statute was by proceedings for penalties under the statute before a magistrate. They referred upon this point to *Robinson* v. *Barton-Eccles Local Board* (8 App. Cas., 798, at p. 802); *Regina* v. *Tynemouth Rural Council* (1896, 2 Q.B, 451). The Court dismissed the appeal. Lord Justice A. L. Smith said that it was admitted that no by-law of the Corporation had been infringed. When the plans were deposited, the Corporation, in good faith, came to the conclusion that the proposed buildings would contravene section 3 of the Public Health (Buildings in Streets) Act, 1888. In his lordship's opinion, a *mandamus* ought not to issue to command the local authority to approve plans which the latter honestly considered were in contravention of the statute. How could the Court call upon a local authority to approve plans which, at all events in the opinion of the local authority, were in the teeth of the Act of Parliament? The case came within what Lord Justice Chitty said in *Smith* v. *Chorley Rural Council*: "They (the District Council) had jurisdiction in the matter, which they honestly exercised, and it was part of the question before them whether the building of the new houses amounted to laying out a new street. It is apparent that the object of the action is that the High Court may review the decision arrived at by the District Council and overrule it. In my opinion, such an action will not lie." For these reasons the appeal must be dismissed. Lord Justice Vaughan Williams delivered judgment to the same effect.

Important Ancient Lights Action.—The case of *Warran and Others* v. *Brown* came before the Queen's Bench of the High Court of Justice on August 4th. An injunction was sought to restrain the defendant from darkening, injuring, or obstructing the lights of premises owned by the plaintiffs in Bakehouse Lane, Leicester, and for an order that the defendant should pull down a wall in course of erection. The case was tried at Leicester Assizes, when judgment was reserved. In delivering judgment Mr. Justice Wright said: This case raises a question of general importance in relation to ancient lights—namely, whether the right which is acquired by statutory prescription is a right to the continuance of substantially the whole quantity of light which has come to the windows during the 20 years, or is ordinarily limited to a sufficient quantity of light for all ordinary purposes of inhabitancy or business. It seems strange that such a question should be still open for discussion, but there is a considerable body of authority in favour of either proposition. The facts are these. The plaintiffs, as the owners and the tenant of a building in the town of Leicester, claim damages and an injunction in respect of the obstruction of the access of light to windows more than 20 years old. At the trial the claim was limited to two rooms, one on the ground floor and the other above the former, both facing to the south. For a length of about 17ft. in front of these rooms the defendant has raised his own building from a height of about 20½ft. to about 26ft., but has set it back about 2ft. or 3ft., so that the width of the street between the two buildings, which was about 17ft., is now about 19ft. Four out of five windows in each of the two rooms are opposite to that part of the defendant's building which I have mentioned. These windows are large and high. Light is not in any direction cut off by very high buildings. I find that the defendant has not obstructed or diminished to any material extent, if at all, the light coming to the upper of the two rooms in question. As regards the four windows on the ground floor, I find that the defendant has materially diminished the light which the plaintiffs enjoyed for those windows for twenty years past, but that abundant light remains for all ordinary purposes of inhabitancy or business. I find that the defendant has by the acts complained of diminished the light so that it is now materially insufficient during some part of the day for the special requirements of the plaintiff Baum's (the lessee) industry (manufacture of hosiery). I find that the plaintiffs' premises have throughout the 20 years before action been suitable for such a manufacture as that now carried on by Baum, and that the kind of manufacture is and has long been common in the district, and has for 20 years past required more light than most other industries, but not until the last few years in so high a degree as at present, the older machines having been less delicate and complicated. I think that the light as it now exists would have been sufficient for any but the most recent kinds of machines. In my judgment no sufficient case for a mandatory injunction is made out in any view of the plaintiff's rights. The inconvenience to which Baum was subjected can be, and to a great extent it has been, obviated by the removal of machines to the upper room, and in any case it can be remedied by some increased expenditure for gas. The question is whether the plaintiffs are entitled to damages. If they are, I assess the amount at £100 for the tenant and £200 for the reversioners. A number of cases were cited, after which the Lords Justices James and Mellish and the Lord Chancellor (Lord Selborne) gave their opinions. Judgment was entered for the defendant, with costs.

Current Periodicals.

The Canadian Architect and Builder.—The chief feature of the July number is an able paper on "The Ventilation and Heating of Public Buildings," read by Mr. P. H. Bryce before the Engineering Society of the School of Practical Science, Toronto. If the plates are representative of what is considered Architecture in Canada, our colony must be in a worse state than England is. The houses at Toronto have too many roofs running into each other—in an attempt at the picturesque, we suppose. The National Trust Company's building in Main Street, Winnipeg, is a patchwork of architectural ornament of the "Styles," without even the redeeming feature of having been used with regard to proportion, mass, or solid and void—to say nothing of other essentials of good architecture. The Jubilee Nurses' Home at Montreal General Hospital is no better.

The Brickbuilder (Boston, U.S.A.) for July is an interesting number. Mr. H. B. Pennell contributes an article on the need of travel for the architect, the best system to employ, and the best places to visit. He points out the necessity for the student to possess considerable knowledge of architecture before judging and taking hints from old works. He says:—"Much has been written of the educational benefit to the architectural student of measuring and drawing the buildings of Europe and studying them in plan and elevation, section and detail. In England, especially, is this method paramount; in France, it is happily preceded by thorough academic training; and wherever or whenever it is used it should be combined with a wide knowledge of the history and science of architecture. Otherwise, the theoretical education is only partial and will result in practical archæology, mediævalism or classicism, incongruous and inappropriate." There is a useful illustrated article by Mr. Alfred Hoyt Granger on "The Designing and Planning of Small Railroad Stations." It has happily become the custom in the States to employ an architect upon the design of stations, and not, as in this country, to hand over everything—except perhaps the terminus—to the engineer. Mr. J. K. Freitag writes on "Some Inconsistencies in Modern Fireproof Design." Of the plates, the best is the "Bath House for the City of Philadelphia," Hazelhurst and Huckel, architects: this is a low brick building expressive of its purpose and altogether pleasing. "The Reptile House in Bronx Park, New York," is simple and suitable, but is marred by the detail.

The American Architect for July 21st gives the second part of an article by Mr. W. Paul Gerhard on rain baths in public schools. In the plates, the Memorial Hall, West Point, N.Y., is good on the exterior, but is uninteresting inside. The Battle Monument at West Point is worthy of a better figure on the top, the present one being quite unarchitectonic.—The issue for July 28th contains an article by Mr. E. C. Gardner on "Some Phases of Public Sanitation," and another by Mr. S. Beale on "The Rolls House and Chapel, London." In the plates illustrations are given of the London County Council Weights and Measures Office in Calvert Avenue, Shoreditch; the Shoreditch Free Library, Hoxton; and "Shillingford Hill," Berkshire (Mr. George Hornblower, F.R.I.B.A., architect). The Huguenot Lodge Chambers, New Rochelle, N.Y., is a neat Grecian building, for which we must be thankful.

The Architectural Review (Boston, U.S.A.) for July chiefly consists of an article by Mr. J. R. Coolidge, jun., on "The Characteristic Architecture of the Nineteenth Century." The author says: "If architecture be correctly defined as 'Building with Feeling,' then the characteristic architecture of this century is not architecture at all, or at most it is architecture in a very qualified sense. We build with calculation, economy and skill, not with feeling; with science, with knowledge, with resourcefulness, but still not with feeling. Our so-called architecture is intentional and elaborate and complex, intellectual rather than spontaneous—in a word, not architecture at all, or else the definition is incorrect and itself is in need of defining." Having made this very true statement the author proceeds to class the styles the century has witnessed as: (1) The Classic Revival; (2) The Romanesque Revival; (3) The Gothic Revival; (4) The Modern Renaissance; (5) The Néo-Grec; and (6) "The style of steel and glass and clay products, originating in France and England, developed principally in France and Germany, adopted throughout the civilised world, and just beginning to assume characteristic expression—the only true style of the century." We would wish Mr. Coolidge had chosen his words better; he and many others use the word "style" in such a loose manner. We do not consider as many do that steel should not be used in architecture, for architecture is refined building, and any and every material can be built. The plates illustrate a house in Locust Street, Philadelphia. The architects would do well to consider again the brick spiky ornaments on the dormers and gablet, and the decoration inside and over the doorway.

The Architectural Record (New York).—The July number of this magazine begins a series of articles on "Architectural Schools in the United States" with Columbia University. There are now several schools in the States modelled on the École des Beaux Arts, much more complete for the education of an architect than any we have in England. At Columbia University there is a most thorough system of training to be gone through. There is no doubt that a man of great artistic talent and originality will come out of it much strengthened, but the harm is almost as great as the good in stifling originality in one not so gifted by the great study made of Classic styles. We think that there, as here, as deep a study should be made of Gothic, Hindu, Egyptian, Japanese, Persian, Inca, and other styles, to avoid copyism by showing more of the true principles of architecture. There are other illustrated articles on "The Natural History Museum at Paris" and "The Art Gallery of the New York Streets." There is also a series of illustrations of mausoleums and tombs; Cleave Prior Manor, in Worcestershire; and of the staff and offices of Mr. George B. Post—director of a gigantic "plan factory."

La Revue de l'Art Ancien et Moderne this month is again entirely filled with articles on art subjects at the Paris Exhibition. The articles dealing with crafts, which make up the greater part of the number, will be the most interesting to architects: silver work, tin work, ceramic and glass ware, sculpture, bronzes and jewellery, copper work, iron work, clock work, armour, leather work, and tapestry are dealt with. There seems to be something in the French temperament that admires floridness, and throughout this magazine there are numerous examples of somewhat rococo works commended and illustrated. This is particularly noticeable in the silver work. The sculpture illustrated is, however, very admirable. Three special plates are included in the number—photogravures of a painting by Henner, a reserved piece of sculpture, "Le Mariage Romain," by E. Guillaume, and a piece of sculpture titled "Les Premiers Pas," by Marqueste; and a remarkably fine engraving in two colours by M. Chiquet of a silver and ivory statuette.

Die Kunst for August devotes much space to reproductions of pictures at the exhibition of the band of artists known as the Munich Secessionists. Dr. Karl Voll contributes a short critique on the exhibition. An article on "The Teaching of Drawing" is interesting as affording a German view of art teaching in English schools. The author, Herr Hermann Muthesius, is a resident in London, and is evidently familiar with our English methods. Of these he speaks very highly, and it is gratifying to our national pride to know that, whatever may be our shortcomings in the matter of the artistic training of the young, we are, in the opinion of this competent critic, far in advance of our German neighbours. "Art in the school" he declares to be what Germans specially need to-day: the average German schoolmaster is too busy imparting scientific knowledge to have any time to devote to the teaching of drawing, and this has led to a general indifference to and ignorance of artistic matters. In regard to architecture, the only question the public ever ask when a new building is erected is: "What style is it in?" "The man who can recognise whether an example of architecture belongs to the Gothic or Renaissance style considers that his artistic education is complete, while he who can find out that the architect of a new house has produced a mixture of Gothic and early Renaissance is regarded as quite an expert." This passage would with equal accuracy describe the general ignorance on architectural matters prevailing in England. Herr Muthesius thinks that in a well-organised system of artistic education lies the remedy for this sort of thing; and no doubt he is right, though we should certainly not recommend our German friends to adopt the South Kensington system in its entirety. An article on French jewellery is extremely well illustrated, and the same remark applies to the article on "Denmark at the Paris Exhibition."

The Berliner Architekturwelt is largely taken up with exhibition matter, though the Paris Exhibition this month obtains only a comparatively small amount of space. The other exhibitions noticed are the Building Exhibition at Dresden and the Exhibition of the Berlin Secessionists. The illustrations include several examples of modern German architecture, the most commendable of which is one of the villa known as Heilbron, a building in the German Renaissance style, in which the architect has relied for the decoration of the façade upon the juxtaposition of differently coloured building materials.

The Antiquary this month contains articles on "St. Katherine in Art, Legend and Ritual," by Mr. J. Lewis André; "Prisoners of War in England a Century Ago," by the Rev. G. N. Godwin; "John Hazlitt the Miniaturist;" and an illustrated note on a French type of bronze axe found at Hull.

The Church Builder for July has illustrations of the new tower to St. Michael's Church, Bournemouth, and of Dundran Mission Church, Bromfield. Mr. J. T. Micklethwaite contributes an interesting article on "Motive in Church Design." Various information about the Church Building Society is also given.

The Quarry this month has articles on the stones and quarries of Yorkshire, the proposed upward boring for water at Reigate and Redhill, and the chemistry of building stones. The upward boring for water is necessitated by Reigate being situated at the foot of the chalk escarpment which rises above the town to heights of more than 600ft. above sea-level. Below the chalk, which is here about 600ft. thick, there is a bed of upper greensand 60ft. thick, separated by a thick stratum of the impermeable gault clay from the Cromer greensand formation. All these strata are water bearing, but the water system of each of these formations is kept distinct by intervening impermeable layers. The joint towns of Reigate and Redhill are situated most favourably for an economical water-supply, placed as they are in the midst of three distinct natural reservoirs. The scheme proposed is to bore upwards into the chalk from some tunnels already made in a disused quarry on Colley Hill, thus tapping the great basin.

The Artist.—The leading article in the August number of this magazine is upon the work of Mr. Conrad Dressler—the very able sculptor-potter. The work of this artist is now well known, and we are glad to hear that he is managing to compete in price with other manufacturers of faience. Many potters have achieved artistic success before Mr. Dressler, but have failed commercially. A good deal is heard now of nothing being so cheap that it cannot be artistic, and we would wish more results were forthcoming and less talk. We object to the writer of this article saying that no form of decoration for building can surpass glazed decorative pottery. The high glaze is generally admitted by all those entitled to criticise architecture to place the material far behind many natural stones,

mosaic, gesso, sgraffito, &c., even in smoky towns. All the idle stone-throwing at the Arts and Crafts Exhibition Society is also out of place in the article. It is stated that Mr. Dressler "is a thorough believer in up-to-dateness—level with the time, out of joint, alas, though it so often is to the artist." A special plate is made of one of M. Odilon Redon's lithographs. If this and the other illustration by him show, as we are told, the intensely personal touch which he possesses when he handles chalks and pencil, we cannot say we admire his personality. Mr. George R. Rigby's illustrated article on "Design for Stencil Work" is concluded in the issue under review.

Feilden's Magazine for August (a birthday number) makes it appearance with a better style of cover design, and is full of readable papers, probably the most important being that on "Railway Rolling Stock of High Capacity," by Mr. J. D. Twinberrow. There seems to be no valid reason why we should not replace our present small waggons, having a capacity of from 4 to 10 tons, with vehicles capable of carrying 35 to 50 tons, as in America. Quite apart from economic questions, the advantage gained by diminished labour and danger in the shunting operations is a factor not to be lightly disregarded. And there is also every reason to believe that much of the congestion that disorganises the goods traffic round our industrial centres might be obviated by such an introduction. There is also an interesting article, copiously illustrated, on the work of the Simplon tunnel; we trust that the tunnel, when completed, will be better ventilated than the inferno of St. Gothard. A paper on notable exhibits at the Paris Exhibition and an account of the exhibits at the Tramways and Light Railways Exhibition will attract attention in a number preserving the reputation for artistic "get-up" which this magazine has always enjoyed.

Views and Reviews.

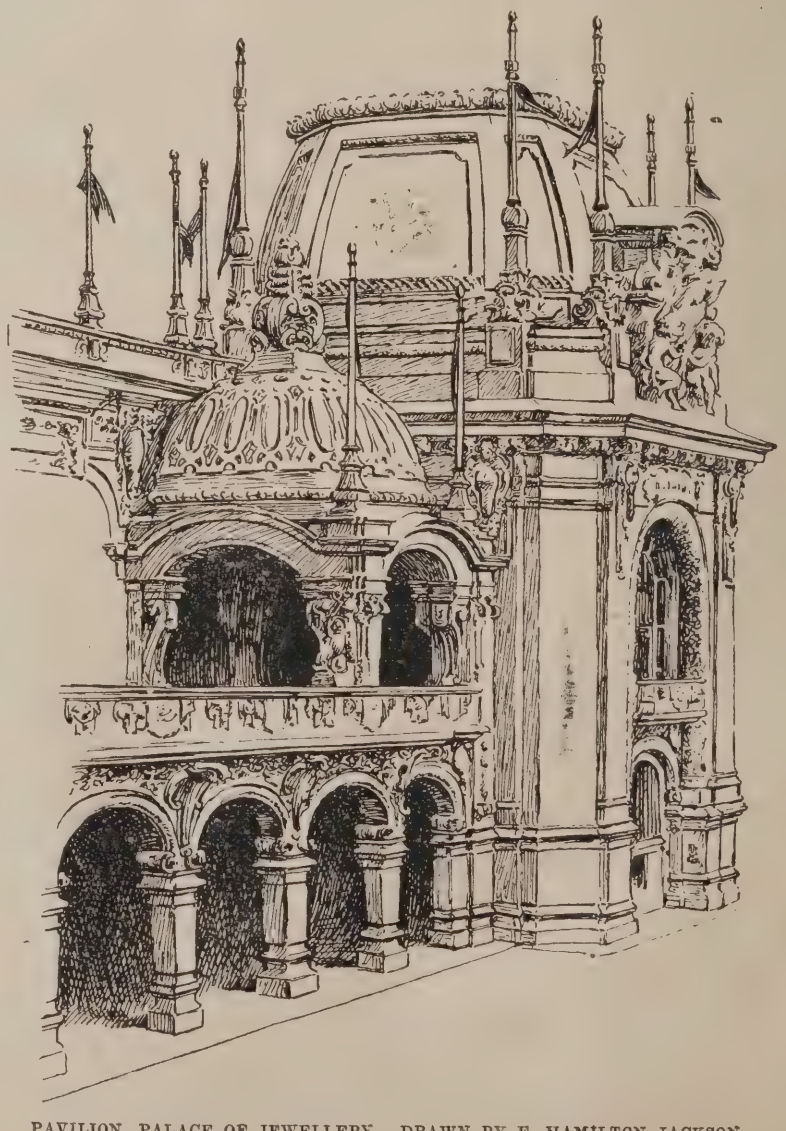
Footways.

The object of this little book is to place before the student public in a concise and handy form, the modern practice in regard to the construction of public footways. We think the author can fairly claim to have succeeded in his attempt to collect information which is too often imperfectly known and is so usually lost in the manuals on roadmaking that the confirmation of any required fact is a matter of difficulty. Very rightly, the necessity of "a firm, solid and dry" foundation is insisted upon, and we trust that surveyors reading this will appreciate the author's dictum that "this being once properly constructed will last, merely (in most cases) the covering or paving requiring to be renewed." We prefer the word "footway" to "footpath," not only because it is a more natural concomitant to "roadway," but also because it serves as a distinction to the "footpath" of the country district. It would be idle to cavil at the work for this however. The book is marred by a few literal and grammatical errors, as, for instance, that on p. 13, line 16, and again that on p. 20, line 1, which the author will do well to correct in the reprint that will doubtless be required.

"Footpaths: their Maintenance, Construction and Cost," by A. Taylor Allen, C.E. Sanitary Publishing Company, Limited, 5, Fetter Lane, E.C. Price, 6d. net.

Art Exhibition at Munich.—The eighth of a series of International Art Exhibitions will be held at Munich next year, and will be promoted by the Munich Artists' Club and the Plastic Art Union of Munich. It will be conducted for the most part on the same principles as the last exhibition, held in 1897, which comprised painting, sculpture, etching and engraving and design, both as illustrated by drawings and as carried out in materials. Further information can be obtained on application to the secretary of the Artists' Club, Künstler Genossenschaft, Munich.

THE PARIS EXHIBITION.



By F. HAMILTON JACKSON.

I.—THE BUILDINGS.

(*Continued from page* 477, No. CCLXXXVI.)

THE Avenue Nicholas II. conducts to the Pont Alexandre III., beyond which the palaces in the Esplanade des Invalides form a brilliant vista, terminated by the grey façade of the Hôtel des Invalides and the gilded dome beneath which repose the remains of Napoleon the First. The bridge springs with a fine curve from bank to bank of the Seine, a leap of 109 metres. The spandrels are filled in with a rather *banale* decoration of pilasters gradually shortening, between which hang garlands. At the crown of the arch come the inevitable Amorini supporting a shield. That to the right symbolises the nymphs of the Neva; that to the left, not yet in position, is to symbolise the nymphs of the Seine. At each end are two pylons, as they call them, supporting gilded groups, which consist of a rearing winged horse and an attitudinising figure of a man attempting to rein him in. They are the work of good French sculptors, and are supposed to symbolise "the renown of the Arts, of Science, and of Commerce." The pedestals are very good, being reminiscent of the Colleoni pedestal at Venice, though there are but four engaged columns at the angles, which are more lofty. Beaks of galleys protrude from three sides, and on the fourth is a group, symbolising respectively the France of Charlemagne, Contemporary France, France at the time of the Renaissance, and the France of Louis XIV. These figures are not without dignity. The candelabra are rather dumpy and squat in proportion, but the groups of children sporting round them are pretty. The thrust of this bridge upon the abutments is calculated to be 50 kilos on each square centimetre, and it is said that it would have been impossible to construct it a few years ago with the materials which engineers then had at their command.

The Porte Monumentale, by which one enters from the Place de la Concorde, and about which so much fuss was made, is, like a great deal of the design of the palaces, distinctly reminiscent of the bride cake. The main fillings of the spaces left by the iron construction are made of wood and cement, coloured in pale colours and ornamented with badly-designed patterns in very effective iridescent blues, greens and gold. A frieze of rather over-sketchy pottery panels of animals runs round the base at about the level of the eye, good as far as the animals go, but with the field sunk round each as if it were being prepared for casting. These are the work of M. A. B. Got. Above them is on each side a relief, also in pottery, glorifying the *ouvrier*, and not very good. It is crowned by a preposterous figure symbolising La Parisienne, by Moreau Vauthier, which wears a sort of long robe and from any point of view but the front is shapeless. In front rise two slender obelisks which, together with the great arches of the gate, are pierced by holes filled with projecting glasses of different colours, lighted at night by electric light. It is evidently planned for illumination. The blues and greens and violets then give a spectral appearance from a little distance which is rather striking. The "tinselly" patches and the colour of the large figures in niches beneath the dome, with their painted backgrounds, fall then into place much more pleasantly; but the whole thing, and much of the other decorations about the Exhibition, suggests the pierced patterns stamped in brown

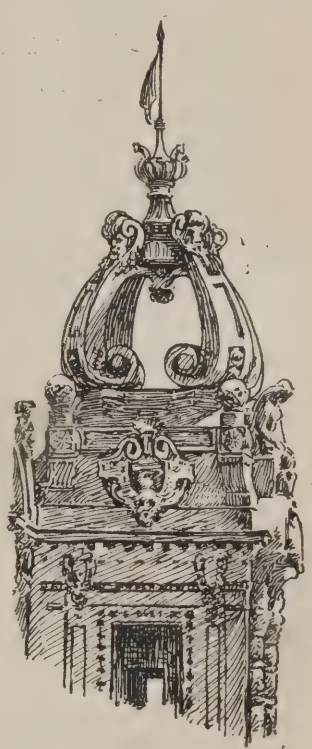
cardboard for kindergarten work, to be made up into various objects.

The façade of entrance towards the Invalides consists of a circular portico through which one passes, open on two sides, the entrance being flanked by two pinnacled pavilions answering to two similar ones on the other side of the portico. At the external angles are two lower pavilions, and between, on the ground floor, twelve round-headed windows in groups of three, the first floor being filled with a long composition in relief in a frame, from which hang heavy garlands caught up above each centre window of the groups by three shields, which are supported by female figures. The shields have inscribed on them the words —"Pax," "Labor," "Ars." Two winged figures on each side above Pax and Ars divide each composition into three, between which are crowds of labourers in various processes. These reliefs, in coloured plaster, are the work of MM. Frère and Damé and are more successful than those at the Porte Monumentale, perhaps partly owing to the fact that while exalting labour they have not felt themselves obliged to dress the labourer in the costume which he wears to-day. The colour is generally cream and pale green, and though the detail is Louis XIV. for the most part the whole has a distinctly Eastern suggestion, specially evident in the pavilions and balconies a little nearer the Pont Alexandre III. In many cases, both in this esplanade and in other places, the painter and decorator in relief have destroyed whatever feeling for architecture may have been in the original design. There is generally too great projection in the modelling of ornament, and one often has the feeling that the design was made to a small scale and the effect of the full size imperfectly realised, though one must acknowledge that when seen by artificial light a good deal of the extravagant relief disappears, and the figures, which rather worry one by day, are not so obtrusive. There is no grand entrance at the Champs de Mars, and the architectural effect is reserved for the interior garden towards which all the palaces face. These include the Palaces of Mines and Metallurgy, of Weaving and of Machinery on one side, and on the other of Education, Transport and Chemical Industries; while at the bottom, facing the Eiffel Tower, is the great Palace of Electricity and the Chateau d'Eau, the great fountains of which are illuminated on the evenings of fête days. This façade is a gigantic effort which has not attained full success, the attempt to combine architecture, water, and a skeleton for effective illumination being perhaps foredoomed to failure. Added to this a certain straining after grandiloquence not infrequently met with in French art is visible, which may be illustrated by the official description of the group in the centre of the lower basin—"Humanity, which advances towards the future, conducted by Progress upsetting Routine and Hatred." Around the edge of the water dragons, crocodiles, frogs and other creatures spout water towards the centre, in quaint silhouette against the spray of the groups of jets which form the lower fountains. The Palace of Transport has a fine frieze, giving the history of locomotion from the earliest times till our own day. Commencing with barbarians and Egyptians, it comes down to air ships and military balloons, the motor tram and bicycle. Pillars which are corbelled out at intervals give richness to the frieze and support an overhanging roof which protects it. In the centre is a well-proportioned arch of entry with balconies above and pavilions at each angle. It is from the designs of M. J. Hermant and is one of the more successful buildings. In this part of the Exhibition, too, the influence of Oriental art seems strong—not in details, which are French and flowery, but in the arrangement and grouping of arches and pavilions, in curved architraves and retiring roofs curved over windows and doorways, in the character of the outlines of towers and domes. Around the Eiffel Tower and below the Trocadero are grouped a wonderful number of buildings of different sorts—some quite valueless from the point of view of art and architecture, and others of the greatest interest. It will be our hope to say something about the best of these shortly.

SUMMIT OF DOME, LITTLE PALACE OF ART.

(*To be continued.*)

ACETYLENE.



By J. H. ELDER-DUNCAN.

ACETYLENE was discovered as far back as 1836, but the difficulty and cost of producing it stifled any interest in the gas outside laboratory walls. Commercially its birth dates from the year 1892. In that year Mr. T. L. Willson, a Canadian chemist, experimenting at Spray, North Carolina, with the great heats obtainable in an electric furnace, fused together powdered lime and coal and produced crystalline carbide of calcium, which, brought into contact with water, gives off acetylene and leaves a lime residue. It should be mentioned here that M. Henri Moisson, a Frenchman, working contemporaneously with, and independently of, Mr. Willson, also discovered the principle of the lime and carbon acting directly upon each other; but his discovery was not announced until after Mr. Willson had privately sent specimen crystals to Lord Kelvin for identification. This discovery made acetylene a commercial possibility, and it has steadily progressed, even in this kingdom, though far less here than in Germany and the United States. Its slow progress in this country is due, first, to the characteristic disfavour with which the British view new chemical discoveries, and, second, the public timidity caused by an imaginary danger attached to its use.

The apprehension of danger may be traced to two regrettable mistakes, the attempts to liquefy the gas and the use of improper apparatus. The first mistake resulted in several terrible explosions and the loss of many lives, and the practical impossibility of compressing the gas having been demonstrated, the Home Government, by amendments to the existing laws, prohibited the production or introduction of dangerously compressed or liquid acetylene in this country. The general public, not being able to distinguish between compressed or liquid acetylene and the ordinary form, have in consequence regarded all forms of the gas as horribly dangerous. Let it be clearly understood that acetylene is not more dangerous than coal gas, and from a medical point of view is far less to be feared than the water gas which is daily introduced in immense quantities into the coal gas supply of the kingdom. Concerning water gas the reader might refer to the paragraph on p. 454 in last week's issue of the Builders' Journal. But when I say it is not more dangerous than coal gas I would insist on it being equally carefully treated. Acetylene is not a toy: it is not a gas that can be manufactured in the kitchen cupboard, nor is it very suitable for table lamps or bicycle lanterns. No one would attempt these purposes with coal gas and no one should attempt them with acetylene. It is precisely because acetylene has been exploited in a wrong manner and for purposes for which it is unsuited that so many customers have become disgusted with it and the industry has correspondingly suffered. And this consideration brings us to the second mistake, the use of improper apparatus, because it is mainly owing to this attempt to foster wrong methods that much of the improper apparatus has been designed. I shall have occasion to say more about this under the heading of "Generators."

Carbide of Calcium.

Carbide of calcium, or calcic carbide, is a dark brown-gray purple-streaked crystalline substance, containing 40 parts by weight of calcium combined with 24 parts by weight of carbon. It is manufactured by the fusion of calcium and carbon (usually in the forms of quicklime and coke or coal) in a specially constructed electrical furnace. The formula is CaC_2. Its specific gravity is 2·262, and when pure a pound of it will yield on decomposition 5·58 cubic feet of acetylene. In practice the yield from best carbide should be about 5 cubic feet per pound in a good generator.

TOWER FROM FURNITURE PALACE.

The price of the carbide runs from £14 to £23 a ton, wholesale and retail. The chief difficulty in its production is the want of a suitable cheap and pure form of carbon. It has not yet been manufactured in an absolutely pure state, but the high percentage of 99·9 has been reached. The carbide will rapidly deteriorate if exposed to damp or atmospheric moisture, and must be kept in air-tight drums or cases, according to the Board of Trade regulations. It is not, however, affected by ordinary heat.

Production and Properties.

On the addition of water to the carbide a double decomposition takes place, the oxygen of the water, combining with the calcium, forming lime, whilst the hydrogen unites with the carbon of the carbide to form acetylene. The lime afterwards takes another molecule of water and forms calcic hydrate, or slack lime, which is left as a residuum and slightly exceeds in bulk the original amount of carbide. This slacked lime is useful for manuring purposes.

The chemical equation in the generation of acetylene is as follows:—

$$CaC_2 + H_2O = CaO + C_2H_2$$

(Carbide + water = lime + acetylene)

The lime afterwards slacks:—

$$CaO + H_2O = Ca(HO)_2$$

(Lime + water = calcic hydrate or slacked lime).

The above-mentioned chemical action gives rise to heat, and if this heat is not kept under the gas will be damaged. At a temperature of 140° F. the gas begins to split up into benzine constituents; at 400° F. it is destroyed for lighting purposes. It follows, therefore, that the generators require very careful designing to prevent this.

Acetylene is a colourless gas of penetrating and characteristic odour. It consists by weight of 24 parts carbon and two parts hydrogen, and is represented by the formula C_2H_2. Its density is 0·92 (air = 1) and it is therefore only slightly lighter than the atmosphere.

The hygienic advantages of acetylene may be stated as follows:—

First: The gas consumes *less oxygen* per candle power than any other.

Second: It adds less carbonic acid to the atmosphere. A 5ft. burner of ordinary gas produces carbonic acid equal to that in the exhalations of eighteen adults, while acetylene gives off but one-sixth that amount.

Third: It heats the air less, the temperature of an ordinary burner being 1400 degrees, that of acetylene only 900 degrees.

Fourth: It has not the poisonous characteristics of coal gas and is not so inimical to plant life.

The other advantages of acetylene are as follows:—

1. It emits a brilliant light when consumed on a proper burner, the spectrum being nearly equal to that of solar light. As an illuminant it is fifteen times more powerful than gas light.
2. The light is exceedingly valuable for photography.
3. The light does not affect colours.
4. It has a steady flame, possessing greater diffusive power than any other light.

The truth of the saying that figures can be made to prove anything is well exemplified in regard to the cost of acetylene, and the figure juggling which *some* manufacturers resort to to prove that acetylene is cheaper than any other form of illuminant is amusing if not instructive. It may be stated at once that acetylene is not cheaper or dearer than other illuminants. It is difficult to calculate cost, but the usual method is to take coal gas of a certain price and lighting power as a standard, and compare the others, reducing their higher or lower lighting powers to the same equivalent. In this connection it may be stated that acetylene burners usually consume ½ cubic foot of gas per hour, giving a light of twenty to twenty-two candles; and an ordinary coal gas burner consumes 5 cubic feet per hour, with a light equal to sixteen candles.

The following tables, issued by an acetylene generator firm, give a fair idea of the comparative costs of acetylene lighting compared with other artificial light:

Coal gas (ordinary burner) at 2s. 9d. per 1,000 c.f.	1 00
Coal gas (Welsbach incandescent burner, not including cost of mantles) ...	·47
Petroleum	·62
Acetylene (carbide at £20 per ton) ...	·85
Electricity at 4½d. per B.T.U.	1 68

The above figures give the cost of material only, and coal gas is put at the lowest possible price.

If coal gas be taken at 4s. per 1,000 (an average price), the comparison changes as regards gas lighting and comes out as follows:—

Coal gas (ordinary burner) at 4s. per 1,000 c.f.	1·45
Welsbach (not including mantles) ...	·98
Acetylene (carbide at £20 per ton)...	·85

Generators.

A good generator would be—

1. One that produces the gas without detrimental heat being evolved.
2. One that produces the practical maximum of gas (5 cubic feet) from each pound of carbide.
3. One that is simple in construction and without delicate parts that wear out quickly.
4. One that is easy to charge and clean, and regular in its working and not given to fouling.

Unfortunately a machine perfect in all these respects has not yet appeared.

Generators are divided into two distinct classes—automatic and non-automatic. In both classes the contact between the carbide and water is effected in one of the three following ways:—

Type 1. The water drips or is sprayed on to the carbide.

Type 2. The water rises underneath the carbide, and gradually submerges the entire charge.

Type 3. The carbide is precipitated into a large volume of water.

Automatic Generators

are an inventor's craze and their advantages are practically infinitesimal. They are the outcome of the kitchen cupboard idea and are therefore to be avoided.

(*a*) Automatic generators are those which have too small a storage space to contain the whole of the gas generated from their proper charge of carbide. The storage space must not exceed one-fifth of the capacity of the apparatus.

(*b*) When the air in the storage space has been driven out by the ascending gas the capacity of the generator is reached; any excess of gas exerts a pressure which is utilised to end the contact between the carbide and water and so stop the generating process.

(*c*) When the consumption of the gas begins the storage space is exhausted, the pressure relaxes, contact is re-established and generation proceeds. The foregoing is the theory of these generators.

(*d*) The practice is not friendly to the theory. The gas does not immediately cease generating when contact is ended. As long as the carbide is moist the gas will generate until the carbide or the water is quite decomposed. A considerable volume of gas is thus created for which there is no room in the apparatus, and this is forced out of the generator into the open air—a proceeding both wasteful and dangerous.

(*e*) In addition, the extra machinery involved in the automatic action is less easy for the layman to understand and more likely to get out of order. The suction at the burners is likely to hurry the evolution of the gas and cause heat. Also, the automatic type is supposed to generate gas sufficiently quickly to maintain ample pressure at all the burners on the system, but the expectation is not always fulfilled.

The automatic type 1, in which the water drips or is sprinkled on the carbide, is peculiarly liable to overheating. The contact is stopped by shutting off the water supply. The automatic type 2 is also liable to overheating, especially if the automatic action to stop contact raises the mass of decomposing carbide out of the water, or if the water is driven back from carbide that has already been submerged. Both arrangements are very dangerous. The contact is here stopped by preventing the further immersion of the carbide. The automatic type 3, if properly arranged, has no danger of overheating. Contact is stopped by shutting off the supply of carbide; but it will be apparent that, after this is done, the carbide already in the water will have to completely decompose before generation ceases. This class also yields less gas per pound of carbide, owing to some of the gas being dissolved in bubbling up through the water, but through this washing the gas is yielded in a much purer state than by the other classes.

Non-automatic Generators

are likely to come much more to the front. They are naturally simple in design and should be more generally used for permanent installations.

(*a*) Non-automatic generators are those in connection with which a holder is provided with sufficient capacity to receive the whole of the gas generated from the largest charge of carbide the apparatus is capable of taking.

(*b*) In this class of generator the air or circulating space must be as small as possible. An arrangement must also be provided that in case the pipe between generator and holder becomes choked the gas can escape or blow off.

Non-automatic, type 1: This type is the most liable to overheating, as in the case of the automatic type 1. "The makers of apparatus that are liable to give rise to excessive heating invariably deny the possibility of such an action taking place with their generators, and when it is proved to them that it is so fall back upon the defence that even if the mass does become red hot there is no particular danger."—*Report of the Acetylene Committee.* Non-automatic, type 2: This type is very much more satisfactory in the non-automatic class than in the automatic, but care must be taken that the water does not rise too fast, or generation will proceed too rapidly. This type also yields a larger amount of gas than type 3, and will be found generally a useful generator. Non-automatic, type 3: This type is the most simple and safe, but the yield of gas may be less than types 1 and 2 for reasons given concerning type 3 of the automatic class.

Condensation.

Theoretically, half a pint of water is sufficient to decompose 1lb. of carbide. In practice over one pint will be required to thoroughly effect the operation. This is due to the vaporisation of the water by the heat of the combination. This vaporisation points at once to the necessity of condensation, especially when it is considered that the liquid products are very corrosive to paint and metals. In the case of non-automatic generators a drip-pipe or catch-box between generator and purifier may be all that is practically necessary, but for those of the automatic or non-holder type a proper condenser must be provided.

Purification.

All authorities are agreed on the necessity of purification, for the crude gas is tainted with ammonia and phosphuretted and sulphuretted hydrogen. Three materials for purification are in favour:—

1. Bleaching powder.
2. Acidulated chromic acid.
3. Acidulated copper or iron salts.

The two latter are safer to use than the first named. The acidulation is effected by dilution with sulphuric or acetic acid.

Distribution.

The piping is exactly the same as that employed for coal gas. Owing to the small consumption per hour (½ cub. ft.) the piping may be proportionately smaller in diameter, but never small enough to risk stoppage by corrosion. It is hardly necessary to emphasise the superiority of wrought-iron piping over lead or compo, owing to its greater strength and the fact that it is not easily pierced or crushed. The slide chandelier and ball-joint fittings must not be used with this gas. The burners have been a considerable trouble. Owing to the richness of the gas in carbon it requires the presence of a large volume of air to ensure complete combustion. If the air supply is deficient the burners become carbonised and clogged, the flame is smoky and pure lamp black is given off. To obviate this defect fine holes are drilled radially just below the top of the burner and the stream of gas sucks in sufficient air on its way to the orifice. Ordinary metal burners were found to be unsatisfactory and given to carbonising, so experiments were made with other materials. Steatite is the material now generally employed, and the burners are either made wholly of it or have steatite tips. The best form of burner is the double arm or horseshoe type, in which two small streams of gas, one from each arm, impinge on one another. The body of the flame does not touch the burner, but is suspended, as it were, between the two arms. The question of shades is a matter of taste, but the brilliancy of the light usually demands such protection. It should not however be forgotten that the test of a good lighting specialist lies in his ability to arrange the lights in such a manner that the eye is not compelled to encounter direct rays. The complaint that acetylene is too brilliant is absurd, for it is not so strong as sunlight. Sensible people do not look at the sun without the aid of smoked glass.

Uses and Prospects.

Lighting is not the only purpose for which acetylene is adapted. Gas engines have been adapted to its use, but any serious development in the direction of motive power is

dependent on a considerable fall in the price of the carbide. Seeing that the carbide can be made at a cost of £8 a ton, the prices at present ruling, from £15 to £20 per ton, are absurd. It must be acknowledged, however, that the cost of production rests largely on the use of water power to drive the dynamos, for the cost of steam power means a prohibitive price. Attempts have also been made to use acetylene for cooking purposes, but it has a deleterious action on flesh meats, and is unfavourably viewed for this purpose by medical men. In photographic work of all kinds it is invaluable. Generally speaking, acetylene will not supersede coal gas or electric light where they are at present installed, but in country villages or remote districts possessing no system of lighting it has a wide field, for the small size and cost of the apparatus required for its manufacture, compared with the size and cost of an electric or coal gas installation, render it especially valuable in such districts, which have, as a rule, but a small rateable value. But its success in the future must necessarily depend on a reduction in the price of carbide, which is at present much too high.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Removing Paint from Old Panelling.

CATFORD, S.E.—W. H. G. writes: "Which is the best method of removing paint from old panelling, &c, without injuring the wood itself?"

It is almost, if not quite, impossible to remove paint from wood without more or less affecting the fibres of the wood itself, for it stands to reason that anything which is powerful enough to destroy the paint is also powerful enough to have a baneful action upon the wood. The damage, however, may be only a question of degree, dependent upon the care or skill of the operator. At the last Building Trades Exhibition I watched a demonstration of paint removal from wood with a material named "Stripso," the use of which, it was claimed, required only the application of clean water after the removal of the paint or varnish to render the surface fit for painting on again. The ordinary potash-lime method is a good one: Take American potash or pearl-ash (the sub-carbonate of potassium) and fresh stone lime in the proportion of 1 to 3, and after slaking the lime in clean cold water add the potash, and bring the mixture to the consistence of a thick cream. Apply with an old brush, and let stand until the paint softens. Before being repainted the work should be washed with a weak acid solution (vinegar and water will do) in order to correct any alkalinity remaining in the fibres. Ordinary washing soda may be used in place of the potash, although it is not quite so powerful. The European agents for "Stripso" are Charles Atkins and Nisbet, 1 Water Lane, Great Tower Street, London, E.C. H. E.

The Society of Architects.

CROUCH END, N.—S. H. B. writes: "Where can I get full particulars of the examinations for M.S.A.? What are the fees?"

Write to the secretary of the Society of Architects, St. James's Hall, Piccadilly, W. He will give you all the information you seek.

Plans of London Clubs.

NEWCASTLE-ON-TYNE.—B. P. writes: "I shall be very much obliged to you if you can tell me where I can see or obtain plans of the Junior Constitutional and Junior Military and Naval Clubs, or any other good and representative examples of clubs."

We are unable to refer our correspondent to any publication containing the plans of London clubs. Application could be made to the secretaries, who could perhaps put our correspondent on the right track.

Lights for Billiard Table.

NORTHAMPTON.—Q. writes: "What is the best light for a billiard room, more especially for over the tables? I am told that electric light has a bad effect on the eyes and that more shadow is thrown by the balls than by incandescent gaslight. Which do the best professionals (billiard players) favour?"

Incandescent light is very good for billiard tables. Professional matches, however, are usually played under the electric light. One lamp (32 candle-power) under each of the six shades is quite sufficient, and is much better than two lamps of less power. No bad effect is experienced if the shades are so made as to properly screen the eyes.

BURROUGHES AND WATTS, LTD.

Civil Service Examinations.

BRIXTON, S.W.—DERRICK writes: "Where could I obtain full information about the following Civil Service appointments:—The Admiralty Works Department, Royal Engineer Department, the English Office of Works, and the Irish Board of Trade? I read with interest an article on these appointments on p. 265 of your issue for May 16th last."

Particulars of the examinations named can be obtained through the secretary of the Civil Service Commission, London, S.W. "Draughtsman" can also make application to the Commission for the particulars he needs.

HENRY ADAMS.

Examinations for Surveyors.

DUNDALK.—IRELAND writes: "Is it necessary under the Act of 1899 to pass an examination for a borough surveyor, and, if so, what are the subjects and where can I obtain suitable books dealing with them?"

Our correspondent presumably refers to the London Government Act, 1899 (62 & 63 Vic. c. 14), which contains no provision as to the appointment of surveyors to the boroughs created by the Act. The Act transfers the powers of vestries and district boards to the new borough councils, which will, presumably, take over the present vestry surveyors. Advice as to preparation for a surveyor's duties might be obtained from the Secretary of the Surveyors' Institution, Great George Street, Westminster, S.W. G. H. B.

Ancient Lights.

SUNDERLAND.—ENQUIRER writes: "I am adding a new block two storeys high to my house; the block projects 13ft. from the main wall and 7ft. 9in. along neighbour's main wall. There are windows on both storeys. Can my neighbour claim compensation for interfering with his right of light?"

Yes, if the lights are "ancient lights," or if in any other way the neighbour has a right to the uninterrupted access of light to the windows. He can, in either of these cases, restrain "Enquirer" by injunction from proceeding with the building, and compel him to take it down so far as it obstructs the light.

H. P. B.

Builders' Notes.

The "Champion" Chimney Pot is made by the Patent Chimney Pot Company, Limited, of 105 Albion Street, Leeds, and can be obtained in two qualities, one now costing 16s. and the other 18s. It is made of fireclay and in buff and red terra-cotta, and can be fixed on any ordinary chimney stack. There are six trumpet holes and tubes, the pot has no cowl-cap, and it is claimed that down-draught is entirely prevented.

Hamblet's Blue Brick Company, Limited, has declared for the year ending March 31st, 1900, a balance of £12,544 15s. 8d. The interest on the 4½ per cent. first mortgage debentures absorbs the sum of £2,700, the depreciation written off amounts to £1,159 18s. 1d., leaving a balance of £8,684 17s. 7d., out of which the directors have paid interim dividends on the preference and ordinary shares amounting together to £4,800, and a balance of £3,884 17s. 7d. remained at March 31st, 1900. A final dividend at the rate of 6 per cent. per annum, absorbing a sum of £1,800, has since been paid out of this balance upon the preference shares, leaving £2,084 17s. 7d. undivided, which is carried forward to the next year.

Piece Work and Housing.—A correspondent recently called attention in a daily paper to a point which is worthy of grave consideration. He said:—"Some time ago correspondents doubted whether a bricklayer could lay 1,300 bricks a day. A builder says that when he was a workman he used to lay 2,000. Sixteen years ago London bricklayers laid 1,000, and now lay half as many, and Bristol bricklayers are not allowed to lay more than 400. Like restrictions prevail in other branches of the trade, and so the cost of building houses is doubled. The restrictions are aimed at the middle class, and fall most on the poor, who pay nearly twice as much rent in Nottingham as in Belfast, where bricklayers, &c., contract for their work and are paid for piece work. Do not these facts point to a chief difficulty in housing the poor?"

The Improved Industrial Dwellings Company, Limited, held its ordinary general meeting recently. Sir Sydney Waterlow, who was in the chair, said that the expenditure on capital account amounted to £1,114,685, which included the sum which had been expended on their new buildings in the Old Kent Road. The cost for these worked out at £75 per room, which compared with a cost of £45 per room which prevailed when the company first started its operations. There were several causes for that advance, the chief one being the higher cost of labour, while materials had also risen to a considerable extent in price, and the demands of the sanitary authorities were expensive matters. The average charge per room per week over the whole of the company's estates was 2s. 3d., but with regard to the new buildings the company would have to charge 3s. per room. All the rooms which the company had to let were readily taken up, which showed, he thought, that the weekly wages' class were in a better position than they were 25 or 30 years ago. The rents were paid to the company with a regularity which he thought would surprise anyone not connected with the undertaking. The rents and sundry receipts of the estates amounted to £115,381, leaving a balance of £41,164, allowing of a dividend on the ordinary stock of 5 per cent. for the year, and a dividend of 5 per cent. on the deferred shares for the year ending June 30th, 1900.

New Building By-Laws for Portsmouth.—Portsmouth, perhaps following the lead of Glasgow, is going to have some new building by-laws. The revised proofs are now under consideration. These do not include any by-law dealing with the erection of buildings on land which has been used for the deposition of rubbish, though there is the general provision that the entire ground surface or site of any new building is to be properly asphalted or covered with a layer of good cement-concrete, rammed solid, at least 6in. thick. There are districts at Southsea where even this proviso would not be sufficient to ensure a dry foundation. It is enacted that all new streets shall have a minimum width of 40ft., and there is a clause which provides that no building shall, without the previous consent of the Council, be erected which shall exceed in height the width of the street. The restrictions as to the materials are very scanty, it being merely stated that walls should be constructed of good bricks, stones, or other hard incombustible materials, properly bonded, and solidly put together with mortar "compounded of one part good lime and two parts of good sharp sand or other suitable material, with good cement, or with good cement mixed with clean sharp sand." Considering the numerous varieties of mortar used by the trade, some consisting of road dust and lime, and others of sea sand, or even earth, this clause should have been more definite. The regulations relating to drainage seem to be satisfactory, and the by-laws generally may be regarded as a great improvement on any that have previously obtained in the borough. They are framed on the model by-laws approved by the Local Government Board.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Oh, to build, to build!
That is the noblest art of all the arts.
Painting and sculpture are but images,
Are merely shadows cast by outward things
On stone or canvas, having in themselves
No separate existence. Architecture,
Existing in itself, and not in seeming
A something it is not, surpasses them
As substance shadow.

"Michael Angelo," Part III.—LONGFELLOW.

Priced Quantities. AT the recent summer meeting of the National Association of Master Builders, held at Nottingham, Bristol scored in respect of a subject which has for many years occupied the attention of the local association. Mr. George Humphreys, the president, moved a resolution to the effect that no priced quantities should be sent in with the estimate, but should members receive an invitation to tender for work where it was stipulated that quantities should be sent in with the tender they should immediately inform the secretary of the Federation and the committee will at once take up the matter, with the view of avoiding friction between the contractors and the architects. After arguing the point with the meeting and remarking that the Bristol architects generally accepted this principle, he said the rule was made in the Bristol Association when Mr. A. Krauss was president, and he believed that the majority of the members supported it. The tenders were submitted and the bills of quantities were taken when the tenders were accepted. The proposition was seconded by Mr. W. Church and carried unanimously, so that the resolution will now be forwarded to all local associations throughout the country, and no doubt the majority of them will strictly adhere to it.

Cardiff and its New Town Hall. AS we have already noted, the good people at Cardiff have been enjoying themselves in lengthy discussions over the matter of their new Town Hall, which, by the way, will be situated in Cathays Park. One party wanted to delay the erection on account of the present high price of materials; the other party said, "Cost or no cost; let's make a start now or we never shall." Matters see-sawed in this way for some time, but last week the Cardiff Town Hall Committee came to a decision. Councillor Beavan said he was connected with a big undertaking in Cardiff which proposed to spend £60,000 or £70,000 in extending their works and buildings. They had the plans prepared and tenders in, but the contract was so heavy that they simply laid it aside for a time. Mr. Veall, speaking of the leading item of Portland stone, prophesied that the tendency would rather be upwards than downwards with large new quarries being opened. They had the park, and the ground was lying idle. When it had been utilised the valuable site on which the present buildings stood would be in the market. Of the 1¼ millions, the cost of the scheme, probably one-third would be spent upon labour and circulated in the town. The deputy-mayor pointed out that they were talking, to a great extent, in the dark. The law courts, they had been given to understand, were badly wanted, and they might, perhaps, proceed with them and defer the new Town Hall. Finally it was decided to postpone further consideration until tenders had come in.

Brighton Aquarium. BRIGHTON Aquarium is about to be purchased by the Corporation. A report prepared by the General Purposes Committee holds out the prospect of a most important development of the undertaking, which will, among other things, place Brighton in possession of a large winter garden. The Committee are of opinion that it is desirable that the character and use of the premises as an aquarium should be preserved as far as possible. The winter garden will consequently be an addition to and will not supersede the present buildings. The extra space demanded for this purpose will be obtained by the demolition of the restaurant and bazaar under the cliff—the last-named being the sole remaining vestige of the old Chain Pier—and by absorbing a portion of the roadway. Concurrently with this project, an improvement of the Marine Parade will be carried through. At present that portion of the Marine Parade immediately overlooking the Aquarium is bow-shaped. The intention is to make the line of frontage straight by carrying the promenade forward on arches. This alteration will be an improvement of great value, as it will add much to the comfort of the large number of persons using the promenade. All these various matters, including permission to ascend above the present restricted building line, will require the assent of Parliament, and a Bill is to be prepared accordingly; whilst the Committee ask for authority to obtain competitive designs for the adaptation and alteration of the buildings, and to offer premiums not exceeding £500 for such designs.

Archæological Researches at Hayles, Gloucestershire. FOR some time past Mr. St. Clair Baddeley and the Rev. William Bazeley, of the Bristol and Gloucestershire Archæological Society, have been conducting researches at the abbey church of Hayles, about twelve miles from Cheltenham. One of the most interesting discoveries this year is an old chronicle of Hayles Abbey, written about 1365, shortly after a devastating inroad of the Black Death, but containing little information regarding the abbey itself. One of the earliest entries tells us that the church and monastic buildings were commenced in 1246. The moulding of the stonework shows that the church is distinctly of two dates—Early English of *circa* 1250, and Transitional Early English of *circa* 1275. In 1271-77 an eastern apse was constructed with five polygonal chapels, two semicircular ambulatories, and another structure from a point in which radiated all the rest. This structure is, without doubt, the base of the shrine in which rested for 200 years the Holy Blood of Hayles and the piece of the true Cross. Considering that the site has been twice dug over for materials to build a home for the Tracy family at Toddington, and that many farmhouses and buildings in the vicinity are built of stone taken from the abbey ruins, it has been an agreeable surprise to find the base of the shrine intact. The beautiful apse in which it stood is believed to have been unique. The two chapels of the eastern apse on the north and the two on the south were floored with late thirteenth century encaustic tiles bearing the arms of Edward I., Richard King of the Romans, Queen Sanchia, Edmund Earl of Cornwall, and the Countess Margaret. Westward of the presbytery is the monks' choir, occupying the crossing and one bay of the nave. There are no traces of a central tower as at Tintern, nor of a tower at the north end of the north transept as at Fountains; but there are traces of a tower to the west of the north transept—a very unusual place for it. The church with the apse is about 320ft. long, as long as Gloucester Cathedral without the Lady Chapel. The work, which has proved so interesting and so fruitful in discovery, is being carried out by voluntary subscription, the treasurer of the excavation fund being Mr. G. M. Currie, 26 Lansdowne Place, Cheltenham. Until the end of August, when it will probably be found necessary to cover in the church, Mr. Bazeley and Mr. Baddeley have arranged to act as guides to the abbey and museum to visitors on Thursday afternoons.

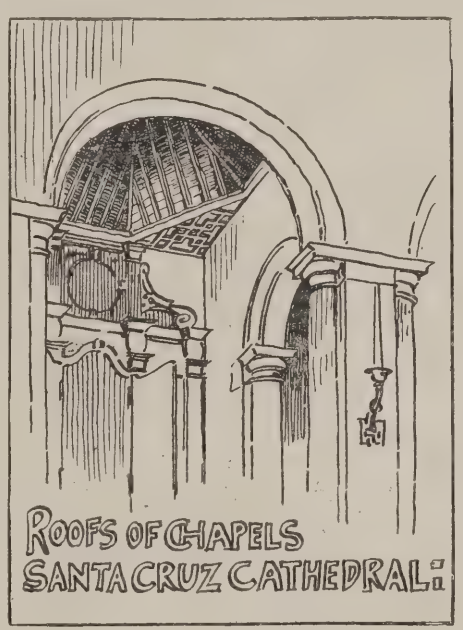
A New Surrey Asylum. THE Visiting Committee of the Surrey County Council appointed to provide additional asylum accommodation recently sent out invitations to the members of the Council to suggest the names of suitable architects for the proposed asylum at Netherne. They received 49 replies, and after carefully considering them they arranged with Mr. George Thomas Hine, of 35 Parliament Street, S.W., to assist and advise them generally in connection with the methods to be adopted to secure the erection on the Netherne Estate of an asylum designed to provide in the best manner accommodation for 1,200 lunatics of all classes. Mr. Hine's fee for this assistance and advice will be 300 guineas, but it has been mutually agreed that, if Mr. Hine is appointed to carry out the work of designing the asylum, such fee would merge in his commission as architect.

Yatton Church Tower. YATTON is a place near Bristol, and for some time past—in fact, for years past—there has been a good deal of discussion as to what should be done to the truncated tower of the parish church. There has been a flood of correspondence and almost countless meetings and consultations. Antiquaries almost to a man were in favour of patching up; but practical opinion inclined to rebuilding the tower so long as the picturesque truncated character which renders Yatton a landmark to all Great Western travellers was preserved. The final decision is to take down and rebuild, and this has been decided by the parishioners who use the church and are proud of it; those of them who opposed rebuilding, now that the verdict has been given, have intimated their intention to do their best to raise the needful funds.

A County Architect's Duties. THE Cheshire County Council has decided to vary the remuneration and duties of their architect as follows:—The salary to be £500 per annum; the commission to be £5 per centum, but only to be charged upon the actual expenditure on all works carried out when the contract price exceeds the sum of £1,000, such increased commission to apply to all contracts in course of completion on July 2nd, 1900; to be paid a sum of £100 in full satisfaction for all professional services and disbursements, including the preparation of plans prepared by him, in respect of the alterations at Chester Castle and development of the prison estate, and the carrying-out of all contracts relating thereto, and in addition to be paid fees for preparing the plans showing the drainage of the several police stations of the county; in addition to the duties specifically prescribed in the terms of his appointment, the county architect is to examine and report upon all sites offered to the Council, to survey and peg out such sites, to prepare plans for conveyances, leases, &c.; and to superintend the carrying out of all work on the prison estate at Chester Castle.

"Ye Olde Dick Whittington." CLOTH FAIR boasts the oldest licensed house in the City of London—"Ye Olde Dick Whittington." Compared with the rest of the house, says the "City Press," the base is of modern construction, and yet not modern as the term is understood at the present day, for it must have been in existence for nearly two centuries. In the upper part of the house nothing has been altered since the days when the house was erected: the huge oak beams still bridge the ceilings of the rooms, in which, no doubt, Flemish and Italian merchants foregathered in the troublous times of the Plantagenets. There can be no question as to the whilome importance of "Ye Olde Dick Whittington": its position was such as to give warranty to the belief that many historic notables must have found accommodation within its walls, and have been entertained in the style characteristic of the days that are gone. Dick Whittington, "Lord Mayor of London Town," possessed a residence in Milton Street, once the famous Grub Street, which is but a short distance away; and to this fact must be ascribed the origin of the name of the house. As Whittington died in 1427 it is easy to conclude that the tavern existed as such in the time of the War of the Roses, so that, no

other tavern in the City laying claim to establishment at that period, "Ye Olde Dick Whittington" may fairly be regarded as the oldest licensed house in the City of London. It is somewhat curious, considering these circumstances, that most writers on London antiquities should have failed to notice this hostelry.



Liverpool's Garden. "WHAT shall be done with St. John's Garden?" This is a question which bothered the Liverpool Corporation a long time, but now they have settled it by adopting the scheme of Mr. Shelmerdine, their city surveyor. This provides for the widening of St. John's Lane from 50ft. to 70ft., by taking 20ft. off the churchyard; for the widening of William Brown Street from 66ft. to 90ft., by the removal of the plateau in front of the Brown Museum; and for the laying-out of the churchyard according, in the main, to the suggestions of Mr. Frampton, R.A., the sculptor of the monument to Mr. William Rathbone. At present the churchyard not only slopes from east to west, but from north to south. The scheme provides for the lowering of the level on the north side by an average of 3ft. This will necessitate the removal of a great many remains. The estimated cost of this part of the work is £20,000. The churchyard will then, however, be level from north to south. The main feature of the plan of decoration is an avenue 40ft. wide, extending from the terrace adjoining St. George's Hall to the Old Haymarket. From the Old Haymarket the entrance to the garden will be through three gates of light and elegant ironwork, hung between massive piers surmounted by sculptured lions. In the centre of the avenue will be a circular space surrounding a fountain and enclosed by an ornamental stone balustrade decorated with obelisks. The avenue will lead up to a circular level space, 110ft. in diameter, laid out in walks and flower beds.

A Satisfactory Scheme. ON the east side of this level space will be the semi-circular retaining wall of the upper terrace. The wall will be supported by buttresses treated architecturally, and will be surmounted by an ornamental balustrade of stone. On each side of the main promenade, and parallel with it, are two promenades, each 20ft. wide, leading to the flights of steps by which the upper terrace will be approached. The steps will be flanked by two pairs of pillars, on which it is proposed to place bronze griffins. In the centre of the circular space below the terrace the idea is to locate an important public monument—probably that to Mr. Gladstone. Other monuments will be placed on the terrace in effective positions. The existing statue to Mr. Alexander Balfour will be placed in the main avenue. Connecting the three main promenades are walks 10ft. wide. The garden will be surrounded by plantations, and the outer wall will be an ornamental construction, with strong piers at intervals of 30ft. and light railings between. Instead of the plateau in William Brown Street, the scheme provides for laying out the land in front of the museum in slopes and terraces. The approach to the building will be by a flight of thirty-four steps, extending the width of the portico.

Santa Cruz Cathedral. SANTA CRUZ is the capital of the island of Teneriffe, and the Cathedral of the Conception stands in a low quarter of the city, but it is redeemed from the commonplace by its fine campanile. This stands on the left side of the nave, its basement forming a porch to one of the principal entrances to the church. The architectural features of the interior are unpretending enough, the windows being mere holes in the walls, while the arcades consist merely of thin slightly-moulded elliptical arches carried on plain Doric pillars. The roofs of the chapels, of one of which we give an illustration by Mr. C. A. Nicholson on this page, are each formed into a small octagonal cone with flat triangular soffits at the corners. These soffits have slight decoration, small fillets of wood being nailed on to the boarding in an interlacing pattern, rather less bold than that upon the nave tie-beams. In one chapel the dome is pleasingly painted in bright colours; but, with this exception, the roofs have all been whitewashed.

A Despicable Act. MUCH indignation prevails among the townspeople of Leighton Buzzard over an audacious deed of disfigurement of the antique market cross which has for centuries stood in the centre of the town. At an early hour the other morning some young men fixed a couple of ladders against the cross, and by this means one ascended the structure and deliberately hacked off the left arm of the beautiful statue representing the Virgin Mary and Child—the most conspicuous figure in a group of five. The townspeople are at the present time spending £200 on repairing the cross and renovating its ancient carving. The cross is fourteenth century work and is one of the most famous in the kingdom.

Vandalism at Windsor. WINDSOR has now sacrificed an ancient street for a drill hall, which could just as well have been erected on a piece of unoccupied land. The street was one of the most ancient and interesting in the town, and

ROOFS OF CHAPELS SANTA CRUZ CATHEDRAL.

DRAWN BY C. A. NICHOLSON.

facing as it did King Henry the Eighth's gate it formed part of the *tout ensemble* of the Castle. We have such a lack of historical houses lying in the path of the public. The ancient seats of our nobles are mostly far from towns and surrounded by private parks. It was pleasant, therefore, to have these old houses built for the gay Court of King Charles the Second standing in a main street. As these houses were built purposely for the residences of ladies and gentlemen in attendance at the Court, an underground passage connected all the houses on the east side of the street as far as the old Vicarage, and branched off from there to the Castle. This passage was closed up about forty years ago. The house in which Nell Gwyn is said to have stayed is on this side of the street, but it is more than doubtful if she really resided there. In several of the old maps and prints Church Street is wrongly marked as St. Alban's Street, which may have given rise to this supposition. The only letter of Nell Gwyn's composition known to exist is dated "Windsor, Burford House, April 14th, 1684." This was the residence built by her and occupied later on by her son—the young Earl of Burford, afterwards created Duke of St. Albans—and was situated on the north-east or Castle side of what is now St. Alban's Street, running parallel to Church Street. In Norden's map of the town (1607) the street is shown leading up to the town church, which probably accounts for its name. In Hollar's view it is shown terminating abruptly, as it does at the present time. The old Town Hall stood at the Castle end of Church Street, but was done away with when the present Guildhall was built in 1889. At the opposite end of the street was the lock-up, and it was here, early in the nineteenth century, that the notorious Barthelmy was brought after his arrest at Priest's Hill, the scene of his last duel, in which he killed his antagonist.

The Carthage of To-day. A RAILWAY now runs to Carthage from Tunis. The summer palace of the Bey may be visited but superficially. A walk through the courtyards is allowed, surrounded by thickly latticed windows, but one may not stand still within the precincts. Not on the direct road to Carthage, but easily reached during the same drive, is the museum at Bardo, opened in 1888 in the old harem adjoining the Bey's public palace, and full of most interesting results of recent North African excavating. Catalogues can hardly keep pace with discovery and addition, so that of many beautiful things a verbal description by the intelligent attendant comprises all available information. Especially rich in mosaics, the museum contains room after room filled with fine examples of wall and floor decoration, those found in Suza (Hadrumetum) being generally in a better state of preservation than the Carthage remains. The ancient inhabitants would seem to have pleased themselves by reproducing with their bits of coloured stone many familiar scenes; and so "fishing," with men and boats and nets, a "seashore banquet," quite elaborately worked out, the "chase," with dogs, hunters and flying game, appear. In 1897 a very large pavement design was discovered near Zajhrun, representing the signs of the zodiac in a circle, surrounded by the seven days of the week. In addition to the earlier mosaics, there are many exhibiting Christian designs. But mosaics by no means comprise the chief wealth of the museum. Hundreds of Punic lamps of earthenware are gathered, showing simple but graceful forms and decoration, weird masks with ingenious varieties of contortion in the features, tear-vials and water-jars, and fine bits of sculpture. Three statues have been recently excavated together at Carthage, perhaps the most beautiful at Bardo. The central figure in this exquisite group is thought to be a Ceres, and is more perfect than the others. A few fine relics in gold and silver are shown, and altogether the Musée Alaoui would be an enthralling spot for months of study.

Pagodas. IT is not to China only that pagodas are confined. At Kew Gardens there is a large pagoda. It was erected in 1762 by Sir William Chambers, the architect of Somerset House. His own description of the pagoda as it appears in his work, "The Gardens and Buildings of Kew," is interesting. He says: "The tower commonly called the Great Pagoda was begun under the direction of William Chambers in the autumn of the year 1761, and covered in the spring of 1762. The design is an imitation of the Chinese Taa. The base is a regular octagon, 49ft. in diameter, and the pagoda is composed of ten storeys, all of them octagonal in plan. The lowest is 26ft. in diameter, exclusive of the portico which surrounds it, and is 18ft. high. The second is 25ft. in diameter and 17ft. high, and all the rest diminish in diameter and height in the same arithmetical proportion to the ninth story, which is 18ft. in diameter and 10ft. high. The tenth story is 17ft. in diameter and with the covering 20ft. high, and the finishing on the top is 17ft. high, so that the whole structure from the base to the top of the 'Fleuron' is 163ft." It is not generally known that at Osborne there is a garden cottage in the shape of a pagoda, where none may enter except Her Majesty. This cottage holds nothing but mementoes of the late Prince Consort and relics of the Queen's youth, as well as the toys and games of all her children, many of which the Prince Consort made himself. The pagoda at Pao-tah is the most curious in China, and is regarded with great veneration and respect by the Chinese, for it is the only pagoda on which trees may be seen growing. The Chinese have a leaning pagoda at Ningpo.

Keystones.

Guildford Corn Market.—The Guildford Town Council have instructed the Borough Surveyor to prepare plans and estimates for a new building.

"Some Points in Architectural Photography" is the title of an illustrated article by Mr. C. H. Hewitt in "The Amateur Photographer" for August 10th.

The Wallace Memorial at Robroyston was unveiled recently. The memorial takes the form of a cross 17ft. high, standing on a pedestal 8ft. high.

The Hampstead Hospital Committee have secured a site for a new hospital building at Hampstead Green, which the Vestry is endeavouring to secure as a public open space.

Town Hall for Leigh.—The Leigh Town Council are considering the question of erecting municipal offices and a borough police court and offices on the vacant land in Market Street, at an estimated cost of £50,778.

New Municipal Buildings for South Shields.—The Town Council has decided to erect new municipal buildings on some vacant ground belonging to them between Ogle Terrace and Broughton Road at a cost not exceeding £25,000.

"Photography" for August 9th contains an article on "Analytical Portraiture," a process invented by Mr. Francis Galton which puts Lewis Carroll's Cheshire Cat on a scientific basis—that is, photographing a smile without the face. The number also contains four reproductions of Dutch houses at the Cape.

Home of Rest at Southend-on-Sea.—The foundation stone of a new Home of Rest, to be erected on the Marine Parade at an estimated cost of £3,000, was laid last week. The new home will be open for respectable and deserving poor, irrespective of denominational consideration, and will accommodate forty visitors.

Newcastle Improvement.—The Town Improvement Committee of Newcastle Corporation have passed plans for extensive alterations to the Douglas Hotel, Grainger Street; to the house facing St. John's Church and the Central Railway Station; and also to the Douglas Bar public-house, opposite St. John's Church, and other properties, covering a frontage in Neville Street and Westgate Road of nearly 80ft. The alterations, when completed, will make a gigantic structure with an imposing appearance, and be fully as high as the present Douglas Hotel.

Historic Statues Removed.—The south side of Nicholson's Wharves, Lower Thames Street, which are on the north bank of the Thames, has recently been altered by the proprietors, Nicholson's Wharves, Limited, and a number of statues have been removed. This wharf was up to the early part of the century in the occupation of the East India Company, and there appears to be little doubt that these monuments were placed in position by the Company. There were originally four statues and one bust, but only three now remain, and these are representative of India, Canada or America, and the Colonies. The sculptor was Mr. J. G. Bubb. The owners are thinking of presenting the statues to some London museum.

The Joiners' Company have lately discovered that they are more important than they had supposed themselves to be. Hitherto they have entertained the idea that the guild has been the representative merely of the joiner pure and simple; but it has now been ascertained beyond all question that the art of carving comes within the scope of the Company, and that in times gone by the members exercised a very close supervision over those who practised that calling. Among the members in past ages have been not a few of the most celebrated wood carvers. In view of the discovery the Company have decided to offer a special prize for carving at the exhibition to be held next year in conjunction with the Carpenters' Company.

The Museum of Practical Geology in Jermyn Street, W., is closed until September 10th.

The Ruskin Exhibition at Coniston will be open during this week and the next two. About 2,500 persons have already visited it.

A new Mission Church Room, Camden Church, Peckham, S.E., is to be erected shortly from designs by Mr. Arthur H. Ryan-Tenison, of 7 Great College Street, Westminster, S.W.

Tile Maps.—The "tile map" of the North-Eastern Railway Company is made up of 6-in. tiles and about 6-ft. square. The outline is printed on the tiles and baked in a kiln. The tiles are then coloured and enamelled. Such maps are likely to be useful in schools.

"Builders' Journals" Offered.—Mr. W. H. Tranter, of 3 Blacon Terrace, Taughall Road, Chester, writes as follows:—"I have the 'Builders' Journal' for 1899, minus a few copies. I should be glad to forward the numbers to any reader if he will pay the carriage."

Proposed new Mission Church at Arlesey, Three Counties.—It is proposed to erect a new mission church in Arlesey village immediately. The vicar and wardens and committee have entrusted the work to Mr. Arthur H. Ryan-Tenison, A.R.I.B.A., of 7 Great College Street, Westminster.

Australian Industrial Exhibition.—After a lapse of four years it has been decided to hold at Ballarat another exhibition of manufactures, machinery and industrial and fine arts. The three previous exhibitions were of a most successful character, there being about 100,000 visitors to the last. The exhibition will be opened on November 1st next.

The "Swan" Fountain Pen.—Messrs. Mabie, Todd and Bard have introduced an improvement in the larger sizes of their well-known "Swan" fountain pen. By an ingenious arrangement the pen may now be filled without the removal of any part and the flow of ink regulated without danger of the fingers being soiled. Our readers should send for all particulars and catalogue to 93 Cheapside, London, E.C.

A Clock for the Shah of Persia has just been made by which not only the Teheran time but the time in 12 other cities of the world can be seen. The centre dial, which is the largest, shows Teheran time, while the smaller dials show the time in Peking, Washington, Yokohama, Bombay, Samarkhand, Constantinople, Vienna, Rome, Berlin, Paris, St. Petersburg and London. The work was entrusted to Benson's, of Ludgate Hill.

The Bath Stone Firms.—Another step towards the acquisition by the Bath Stone Firms of the entire stone trade of Portland has now been completed, and only one important firm—that of Mr. F. J. Barnes—remains outside the monopoly. Messrs. Stewards and Co., of Portland, Nine Elms, and Pimlico, have disposed of their business, comprising some of the largest quarries on the island, to the Bath firm, and Mr. R. D. Thornton, a director of Stewards, has handed over to Mr. J. T. F. Turner, a director of the Bath Stone Firms, a conveyance of the property.

Fire Tests with Partitions.—Publication No. 57 of the British Fire Prevention Committee deals with the comparative results of a fire test with (*a*) an ordinary wood and matchwood and coated with "non-flammable" paint. On the side opposite the fire were furniture and boarded partition painted in oil colour, and (*b*) a partition exactly similar but of fireproofed hangings—"non-flammable" and ordinary. In two minutes after the test commenced the ordinary wood partition caught fire and one minute later smoke appeared inside the chamber. After three-quarters of an hour everything was consumed except the studs, which were blazing freely. The prepared wood stood the test well, for after three-quarters of an hour the chamber was entered and the furniture, curtains and antimacassars were intact and unaffected, except at one end, where scorched by the burning of the timber roof of the hut. The fireproofing was done at the London Non-Flammable Wood Company's works at Fulham.

New Public Baths and Washhouses are to be erected at Melmoth Place, Fulham. Mr. H. Dighton Pearson, of 27 Chancery Lane, W.C., is the architect.

Glasgow's New Act.—The Glasgow Buildings Regulations Act, 1900, which was dealt with on page 339 of our issue for January 3rd last, came into operation on July 30th.

The Church of St. James the Less, Teignmouth, has been presented with a new pulpit. The general character of the work is Early English, and the material consists mainly of Caen stone and Derbyshire alabaster.

The new National Schools, Hatfield Heath, have just been opened. They provide accommodation in two rooms for more than a hundred scholars. The site adjoins Trinity Hall. The cost of the work has been about £839.

Excavations at Baalbec.—The German Expedition to undertake excavations at Baalbec, consisting of Professor Puchstein, Dr. Sobersheim, and two architects, has left Constantinople, and will stay at Baalbec about three years.

Alterations to Earlswood Asylum.—A sum of £5,000 is needed for sanitary improvements, now in progress, in addition to the deficiency of £3,000 in ordinary income of the year. Contributions should be sent to Mr. H. Howard, the secretary, at the offices, 36 King William Street, E.C.

Croydon's New Lunatic Asylum.—In order to provide for the accommodation of their pauper lunatics the Croydon County Council are erecting at Chelsham an asylum which will cost about £200,000—£60,000 more than the original estimate. The building will occupy an extremely picturesque and healthy site, and provision is to be made for 400 patients.

Boston "Stump."—The famous tower of St. Botolph's Church at Boston—known to Lincolnshire men as "Boston Stump"—has been struck by lightning. While the "Dead March" was being played for the late Duke of Coburg a mass of masonry, one of the pinnacles of the great tower, which is 290ft. high, fell amid the congregation, but without hurting anyone. The church is one of the largest without aisles in the kingdom and dates back to 1309.

New Fire Stations for Dublin.—The new fire station for the north-east district of Dublin, in Lower Buckingham Street, was opened last week. The new station is the first of a series of three additional fire depôts which are being provided. The building of the second station in Dorset Street has already been commenced, while the site of the third will be in Great Brunswick Street. The Buckingham Street Station has been erected from the designs of Mr. Charles J. M'Carthy, city architect.

Stanstead House Burned Down.—This mansion, on the borders of Sussex and Hants, one of the largest mansions in the two counties, has been completely destroyed by fire, which originated in the roof, where some plumbers had been working. The tapestry, valued at £30,000, was saved, but some valuable pictures, wood carvings by Grinling Gibbons, the bedstead used by Queen Elizabeth, and various heirlooms were destroyed. The loss is estimated at more than £200,000, of which only about £60,000 is covered by insurance. The mansion had been magnificently decorated and furnished. The stables were saved.

Proposed Town Hall for Cheltenham.—The Cheltenham Town Council recently adopted a report and plans by Mr. F. Waller, architect, for a new town hall on the Winter Garden site. The great hall is to be 112ft. by 52ft. and 45ft. high, and will accommodate 1,000 on the floor, with another 450 odd in the galleries. There are to be refreshment and supper rooms, with drawing rooms, card rooms, &c. The architect did not think an outlay of less than from £25,000 to £30,000 should be calculated for a good plain building, exclusive of decorative features and fittings, and a further sum of £5,000 ought to suffice for the latter works. The Council has resolved to apply to the Local Government Board for sanction to a loan of £35,000 for the purpose in view.

Engineering Notes.

Proposed New Bridge at Swansea.—It is proposed to construct a bridge over the river Tawe at Hafod, Swansea.

Torquay and Electric Trams.—The Torquay Town Council has instructed a committee to report upon the introduction of electric trams.

Enniskillen Union Workhouse is being fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool.

The Board Schools at Flimby, Cumberland, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

School of Practical Engineering. — Mr. Arthur Thomas Walmisley presided on Thursday last at the award of certificates to students of the School of Practical Engineering at the Crystal Palace. The next term commences on September 10th.

Electric Trams for Southend. — At the Southend Town Council on Wednesday last the tender of a London and Philadelphia firm was accepted, at the price of £87,500, for carrying out a system of electric tramways for the borough. The work is to be commenced almost at once.

A Lighthouse Builder.—"The Life of Sir James Nicholas Douglass" (Longmans), the builder of the Eddystone Lighthouse, has been written by Mr. Thomas Williams, who served under the eminent engineer for more than thirty years. Douglass came of a well-known Northumbrian family. He began his career of lighthouse building when only twenty-one years old with the lighthouse on the Bishop Rock, Scilly Isles. Thereafter his progress was practically unbroken until he received the honour of knighthood on the completion of the Eddystone in 1882.

A New American Bridge.—The construction of a masonry bridge of considerable magnitude for carrying the Pennsylvania Railroad across the Susquehanna river at Rockville, near Harrisburg, has recently been commenced. This structure is intended to take the place of the present double-track iron bridge, which was erected in 1874 and which consists of 23 spans of about 160ft. each, centre to centre of piers. The new bridge will be located below the existing bridge and will cross the river nearly at right angles to the current. It will consist of 48 spans of 70ft. each and will be in all about 3,820ft. in length, the rail level being 46ft. above the water level at ordinary height. The bridge will be laid with four lines of rails and will probably be the longest stone arch bridge for railway purposes in existence. It is anticipated that its construction will involve the employment of an army of labourers for two years.

Westminster Abbey Decaying.—With regard to the alarming decay of Westminster Abbey, owing to the fumes from the Lambeth potteries, the *Daily Chronicle* says:—"That any sentimental reason will be allowed to interfere with the potteries, it is foolish to suppose. But it is equally foolish to imagine for a moment that the Dean and Chapter will look on calmly at the gradual ruin of the fabric under their charge. It seems very probable therefore that the report of Professor Church is but the prelude to some large scheme of restoration. Far better an Abbey in ruins than an Abbey reduced to the present condition of the Pearsonised transept. There is not much use hoping that a protest from any quarter will be considered, even if it is made. It will be sad, indeed, if to Peterborough, and for that matter to St. Paul's, and the long list of other desecrated churches, Westminster Abbey before long must be added. But it will be interesting to watch the stand taken by Mr. Micklethwaite, the new architect."

Correspondence.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

BRIGHOUSE.

SIR,—I have read the correspondence on this subject with much interest. The suggestion by "Vigilans" is a very good one, and he is quite correct in saying that combination alone will effect a change. What is wanted, too, is that the general public should be enlightened at once, so that any man who is thinking of placing his son as pupil to an architect should have a clear idea as to the number of years of labour and study his son will have to undergo before he can earn £2 a week by hard work.

Yours truly,
ADVANCE.

To the Editor of THE BUILDERS' JOURNAL.

MANCHESTER.

SIR,—Is it not time for another view of the subject, other than that advanced by the majority of your correspondents? To come straight to the point, it is probably their own fault that so many men have salaries of 20s. and 25s. per week. In my experience the profession is comparatively just in regard to remuneration, and men are paid for what they can do, not as workmen at a standard wage, irrespective of their degree of intelligence: this, in my opinion, is conducive to a healthy competition, which to a great extent would be wanting if all received the same salaries immediately articles were completed.

In contrast to cases cited, I know several young assistants, with only three years' experience after pupilage, who are earning between £2 and £2 15s. a week. If the discontented ones would so *improve* their talents that they would be worth more, and be in a position to command more, it would be a better way to achieve their desire than the forming of architectural "trade unions."

Yours truly,
AMBITIOUS.

To the Editor of the BUILDERS' JOURNAL.

BIRMINGHAM.

SIR,—This subject is, as you state, one of wide importance. By importunity only can we hope for a hearing, and the sooner the Association enquires into the matter the better it will be for the profession.

So far, of course, we have only had *our* side of the question, and no doubt "Art Worker" and his fellows hold their opinions, which would give us great delight to hear. "Vigilans" offers a good proposal for surmounting this difficulty, but I am of opinion that the letters of "Hopeful" and "Nil Desperandum" contain too much querulousness, which is a bad sign and will not enhance the reputation of our League. Straightforward combination for the redress of our grievance should be our object.

Yours truly,
JUNIUS.

Double-faced Moulded Skirtings.

To the Editor of THE BUILDERS' JOURNAL.

PUTNEY, S.W.

SIR,—On page 13 of your issue for last week it is stated you are unacquainted with the term "Double-faced Moulded Skirting," and are inclined to think it is incorrectly stated. The term is applied to a skirting having two faces in different planes, separated by a quirk or small moulding. A skirting with only a moulding or chamfer is sometimes described as single-faced. The terms "single-faced" and "double-faced" are also applied to architraves.

Yours truly,
W. A. S.

Discovery of an Old Oil Painting.—The workmen employed in making excavations in connection with the new Roman Catholic Church, Wapping, have discovered a valuable oil painting in a perfect state of preservation by one of the old masters. A gentleman has offered £400 for it.

Professional Practice.

Abingdon.—The Warden and Council of Radley College have approved the plans prepared by Mr. Arthur H. Ryan-Tenison, A.R.I.B.A., of 7 Great College Street, Westminster, S.W., for the extension of the College to the west of the large dormitory block. The work, which is to be undertaken shortly, consists of a new master's residence, a porter's lodge and entrance, a house containing classrooms, studies, dormitories and bedrooms, baths and drying rooms and the necessary offices. Mr. Arthur H. Ryan-Tenison has lately designed and carried out, for the College authorities, the jubilee memorial in the shape of a new cricket pavilion.

Crosland Moor, Huddersfield.—The memorial stone of the new church which is being erected at Crosland Moor, to be dedicated to St. Barnabas, was laid last week. Mr. C. Hodgson Fowler, F.S.A., of Durham, is the architect. The site adjoins the road leading from Lockwood railway station to Crosland Moor. The new church will be in the Perpendicular style. The plan is founded on that of many fourteenth and fifteenth century town churches, consisting of a wide nave and chancel of the same height, and without a chancel arch, but with a continuous high-pitched roof, and having wide side aisles of the full length of the nave, with nearly flat roofs. The nave will have six bays, and will be 93ft. long by 24ft. wide; the chancel will be 37ft. long by 24ft. wide; and the aisles 77ft. by 14ft. East of the south aisle will be a side chapel, 37ft. long by 15ft., and one bay east of the north aisle is to be set apart as an organ chamber. To the east of the north aisle and organ chamber will be the sacristy, and to the north of that the choir vestry. At the west of each aisle will be a large porch, with a doorway into the aisle and western part of the nave. At present it is proposed to place only a wooden bell-cote at the west end of the church; but a western tower 25ft. square and 73ft. in height will be added later. The church will be built of local stone; the high roofs will be covered with tiles, and the flat ones with lead. The accommodation will be for 702 persons, for whom chairs will be provided. The church will be warmed by a hot-water apparatus. The contractors are Messrs. Graham and Jessop, Moldgreen, masonry, joinery, and slating; Mr. W. E. Jowett, Fitzwilliam Street, plastering; Messrs. George Garton and Son, Market Place, plumbing; and Mr. Alfred Beevers, Great Northern Street, painting.

Lancaster.—For some years prior to the disastrous fire which burnt out a portion of the premises of the Lancaster and Skerton Co-operative Society, Limited, in September last, it had been felt that the existing buildings were quite unworthy of a concern doing a trade of nearly £150,000 a year, and soon after the fire it was decided to rebuild the whole block. Negotiations were entered into with the Corporation, the nett result being that in consideration of receiving the two shops, the property of Mr. Marsden, the Society undertook to set back the whole of the buildings to a new street line, 11ft. behind the present one, making New Street 30ft. instead of 19ft. wide. The new premises are to be erected from designs prepared by Messrs. Austin and Paley. The style is Renaissance. The grocery department, with two large windows divided by the entrance doorway, will be followed by the confectionery shop, to which will be added a tea room; the butcher's department, with refrigerating machinery in the cellar; and then the drapery shop, with a corner entrance and two large windows in New Street and two in Church Street. Leading from the shop is a broad staircase, giving access to the show rooms, the dimensions of which will be greater than those of the present hall, and will contain waiting and fitting rooms. Work rooms in connection with the various departments, together with certain store-rooms, dining-rooms for workpeople, &c., are on the top floor. Below the drapery department in Church Street arrangements have been made for a cart passage, which will extend the full length of the New Street block and communi-

cate with each department. The premises allotted to the boot and shoe department will be extended and will contain a ladies' fitting room, the basement being used for stock and cutting-out rooms, while the machinists' and repairing department will be housed underneath the passage. These basements will be lighted by means of deck lights. For the furnishing department all the rooms at present constructed below the hall will be utilised, and by this means an area as large as that of the hall will be available for show purposes, the store-rooms being in the basement. The limit of the block is formed by the main entrance to the hall and offices, which will stand partly on the site of the shop now occupied by Mr. C. D. Sutton. A new doorway will be made into the hall itself, and the present one will be retained for emergency purposes. The offices and committee room are directly over the shoe and furniture departments, and the top floor of this portion is occupied by the library, in connection with which there is a room capable of seating 200 or 300 people. The present building line in Church Street will be preserved. For insurance purposes the block has been divided into four parts, separated by strong division walls, and connected only by gangways across the open space at the back. Provision is being made for the generation of electricity, and a complete plant, consisting of two engines and two dynamos, will be installed below the grocery and confectionery establishments. This portion of the work will be carried out under the supervision of the electrician to the Co-operative Wholesale Society. The whole of the premises will be heated by hot water and will be provided with electrically-worked lifts. The total cost of the premises, including fittings and electric installation, will be about £22,000. A fine new warehouse to cost £7,000 is also being erected in Bath Street from designs by the same architects. It is intended to make it up to date in every respect. It will be three storeys high, with a basement, and will be built of local stone with Westmorland green slate roof.

Manchester.—The Palace Theatre of Varieties has been re-opened after having been closed for re-decoration and structural alterations in the interior by which the seating accommodation has been considerably increased. The work has been carried out under Mr. Frank Matcham, architect, of London. The bottom "boxes" have been taken out and reconstructed, the fronts being built with Italian marble. The marble decoration has also been carried to the other boxes above. The stalls have been re-upholstered, and another row of seats put in. The three front rows of the pit have been removed and form the pit stalls. In the circle the iron girders have been covered in and decorative panels inserted, whilst the seating is new in this portion of the building. The walls round the circle have been re-painted to imitate stonework. The fore part of the foyer has been converted into a grotto of massive rock-work, illuminated by electric lamps fixed in the crevices. To the right of the fountain that is provided is a cascade. The gallery has been structurally altered, and now seats 300 more people. The dome has had four large hand-painted panels inserted. The theatre has been re-decorated in buff and gold.

Portsmouth.—The Royal Theatre has just been re-opened after reconstruction from plans prepared by Mr. Frank Matcham. The building, with the exception of the two side walls, has been rebuilt. A very elaborate portico and balcony of steel, extending along the whole front, has been added, and gives shelter to seven entrances and exits. There are six large electroliers beneath the balcony and two large arc lamps, each 1,000 c.p., projecting from the top of the building, and on the apex of the front is a figure of Neptune. The front entrances are formed of Labrador marble pillars, with sgraffito work on top. The doors, on swing hinges, are of carved mahogany and lead lights, and the approaches are lined with white marble. The grand vestibule for circle and stalls is reached by two white marble steps and mosaic floors, the grand staircase being of white marble. At the top are two figures, standing on marble pedestals, on either side, each holding a spray of electric lights. Here there is the foyer, and the circle is approached on both sides through an arcade. From the foyer is a grand saloon and beyond is a smoking-room and lounge. The circle, which has been considerably extended, is supported by two steel columns only, and constructed on the cantilever principle. The orchestra is sunk. The pit has two more rows than hitherto, and the seats have been placed wider apart to give more room for seating. The front of the three tiers and boxes is of fibrous plaster and scagliola work carried out by A. R. Dean, Ltd., Birmingham. The front of the grand circle and boxes is decorated with nautical emblems, the front of the upper circle having paintings representing Music and Art. The ceiling is painted in delicate sky colours and picked out in cream and gold. The proscenium, with an opening of 33ft., is elaborately decorated; over the top is a painting of an allegorical representation of the Muses, and on either side, level with circle and boxes, are carved figures representing Comedy and Tragedy. The stage has a depth of 60ft., all lighting being electric. The whole of the electric lighting has been carried out by Messrs. Blackburn and Starling, Nottingham. The gridiron, with patent sliding blocks, is 60ft. above the stage. Over and at the back of the stage is a capacious paint-room, and adjoining the stage are a large scene dock, a green-room, property-room, &c. Suites of dressing-rooms for ladies, gentlemen and choruses have been provided, all fitted with lavatories, &c. The dress circle will accommodate 200 and the stalls 120, the seating of the whole house being nearly 3,000. The work has cost over £40,000. Mr. J. H. Corke was the builder. The whole of the elaborate machinery has been executed by Mr. A. House.

Romford.—New public baths have been erected in Mawney's Road, Romford, by the Urban District Council at a cost of £8,000, and were opened recently. The building, which is of red brick with Bath-stone dressings, was illustrated in our issue for March 7th last. There are separate entrances for men and women. In the centre are offices and pay windows, and the front block also contains well-furnished waiting-rooms, a spacious crush hall, a laundry and drying-room, and six slipper baths, the first-class ones being fitted with shower apparatus. The floors are tiled in mosaic, the walls having blue and terra-cotta glazed brick skirting. The rooms and passages are heated with hot-air pipes. The swimming bath is 70ft. long by 30ft. wide, and varies in depth from 3ft. 6in. to 6ft. The sides are lined with white glazed bricks, and the bottom is paved with Terazzo Venetian mosaic in a two-coloured design. There are on each side thirty dressing-boxes, lavatories, attendant's office, and foot bath and shower bath. In the galleries there is seating accommodation for 130 persons. The building is 74ft. by 46ft. 6in. The water for the bath is procured from a well in the rear. The bath holds 65,000 gallons of water, and can be pumped full in ten hours. The water can be heated by steam pipes, by which means the dressing-boxes are also warmed. When the bath is not in use it will be covered with a deal flooring, and converted into a public hall for concerts, meetings, &c. On the first floor there are two large technical instruction classrooms, and a committee room. Above are the caretaker's apartments, and in the basement is the engine and boiler house, pump-room and store-room. The architects were Messrs. Harrington and Ley, of 65 Bishopsgate Street Without, E.C., and Romford. Mr. S. B. Horrocks has had charge of the engineering works, while Mr. Thomas Bruty, of Hornchurch, has erected the buildings and sunk the well.

Thornaby.—The foundation-stone of a new church for the parish of St. Luke, Thornaby, was laid recently. The entire outlay in connection with the new church is estimated to be £6,500, and £3,500 has been raised. The new church is to be of the Transitional Norman type, with round arches throughout, with the exception of a few of the windows, which have lancet heads. It is to be built entirely of stone, with Greek faced-walling inside and out, and dressed stone for windows, doors, pillars, arches, &c. The present contract does not include the western portion of the church, but when the work is completed sitting accommodation will be provided for 700 adults. The plan comprises nave, aisles, transepts, chancel, morning chapel, vestries, organ chamber, porches, &c. Only the lower portion of the tower is to be built at present, but when complete it will be 86ft. high. The first contract, amounting to £4,656, is let to Mr. Henry Harwood, of Manfield, Darlington. Messrs. Hicks and Charlewood, of Newcastle-on-Tyne, are the architects.

THE PANTHEON AT ROME.

THE Pantheon at Rome, in which the remains of the murdered King of Italy have been placed, may be said to embody and to perpetuate the entire history of Rome, from the Cæsars to the Amadei. Agrippa reared the wonderful edifice twenty-seven years before Christ, yet it stands, almost unchanged, older than the Christian era, and by turns a vast calidarium of the great Agrippæan baths, a temple of Mars and of Venus, a meeting-place for the Fratres Arvales—about whom Henzen writes so learnedly—and, in after years, a Christian church, given as such by Phocas to Boniface IV. The wealthy and artistic Rome of Augustus, says the "Daily Telegraph," lavished upon the structure all that art could bring or gold and silver pay for. The Athenian sculptor Diogenes adorned it with his finest labours. The capitals of its pillars, its dome covering, and the ceiling of its portico were all of Syracusan bronze, borne up by massive tubular girders of the same material—which, by the way, were melted down by Pope Urban VIII. to make cannon for St. Angelo's embrasures and the bronze baldachino in St. Peter's. The bronze tiles of the dome were stripped away and plundered to bedeck Constantinople, but the Saracens waylaid the noble loot, which now roofs some mouldering palace of the East. The columns were of white and coloured marbles; its tympanum glowed with the battles of the gods and giants, in ruddy bronze; its interior was lined with mighty slabs of porphyry and syenite and alabaster and agate, which, like its metal work, were all ruthlessly pillaged age after age. But Agrippa's work was like a mountain for solidity and endurance. With walls 20ft. thick of tufa concrete, faced with brick, and a roof which was a wonder of the whole world's masonry, being constructed in one mass of pumice-stone and pozzolana, the plunderers could not destroy, could, indeed, hardly injure or alter, the stupendous and eternal fabric. It comes down to modern times very much as Hadrian and Severus witnessed it, if not as its magnificent designer first created it; and no sight is stranger or finer, even in Rome, than when for the first time the pilgrim turns aside from the Corso to the Piazza di Rotondo and beholds with what nobleness of purpose and material the old Romans housed their deities and glorified their city. The Pantheon still possesses its original doors, between two fluted pilasters, and over these an open screen work, all of bronze. The circular interior—which measures in diameter 142ft., the same as from the floor to the great ring in the dome, admitting light and air—has seven large recesses, between which altars have been erected. Some architects say that the portico of the Pantheon is the most perfect piece of building in the world. Enthusiastic critics have styled it "more than faultless, unmatched," and Byron wrote of it well-known lines of admiration, commencing, "Simple, erect, severe, austere, sublime," which prove how profoundly it affected the poet's mind. Now a new dignity invests the grand old structure.

A Church Manse at Stanley, Perthshire, is being erected. The architect is Mr. I. Murray Robertson, of Dundee. The site is on the top of a wooded slope overlooking the Tay. The front of the building will face the river. The main entrance will be from King Street, with side passages leading to the church.

New Patents.

These patents are open to opposition until September 18th.

1899.—Waste-water Closets.—14,577. S. H. ADAMS, 7 Old Queen Street, London, S.W. This invention relates to a waste-water closet in which the feed pipe is so contracted at its connection with the closet that it momentarily holds back the flushing liquid in the pipe, thus improving and prolonging the flush.

Refuse Destructors.—15,629. E. WILLSHEAR, 113 Whyteville Road, Forest Gate, London, E., and E. C. Amos, 20 Bucklersbury, E.C. The object of this invention is to secure the complete combustion of the refuse and the gases given off. This is achieved by having three cells so arranged that the two outer ones feed the centre one (which is immediately under the steam generator) with partially burnt refuse.

Purifying Acetylene Gas.—17,376. G. F. L. GILES, Harbour Office, Belfast. The purification is effected by passing the gas through a box which is divided by deflecting plates into compartments, each of which is filled with cotton wool, peat moss or other fibre.

Sloping Footways.—17,794. A. R. KAY, 5 Bow Street, Huddersfield. In order to make sloping footways easier to ascend, the materials used—bricks, slabs, &c.—are so laid that a series of wedge-shaped channels are formed across the path, against which the heel of the boot abuts, improving the foothold. For drainage purposes the path may be made convex.

1900. — Heating Apparatus. — 8,263. W. DILWORTH AND E. CARR, both of Charnley Street, Preston. The valve which forms the subject of this invention enables certain parts of a hot-water heating apparatus to be shut off without affecting the remainder of the pipes. A double-action valve is used.

Block Sawing Machines.—8,796. J. BARR, Walkinshaw Foundry, Johnstone, Renfrewshire. This machine is for cutting deals and battens into blocks for paving or other purposes. It consists of a table with a sliding carriage on it carrying a series of circular saws at one end. The backward and forward motion is obtained through a shaft connected with a rocking lever. After the timber is cut the table on which it rests automatically tilts and lets the blocks fall down at the front of the machine.

Fire Escapes. — 10,730. C. R. HARRIS, Williamsport, Lycoming County, Pennsylvania, U.S.A. Fixed in a recess below the window frame is a flexible ladder or reel. A cover is provided which forms a step when opened.

The following specifications were published on Saturday last, and are open to opposition until September 25th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—14,612, OWEN, manufacture of artificial stone. 14,643, HARDINGHAM (*Musciacco*), means applicable for use in proportioning and mixing finely divided or powdered substances. 14,915, PARSONS AND CARNEGIE, ventilating apparatus. 14,995, DUNCAN, NEW SUNLIGHT INCANDESCENT CO., LTD., AND BARNETT, incandescent gas burners. 15,102, SELLARS, manufacture of covering or surface tiles, slabs and other articles, partly applicable to cement. 15,224, ADAMS, flushing and discharging siphons and apparatus connected with them. 16,913, SMITH, Venetian blinds. 17,809, CLIFTON, circular sawing machines for cutting metal. 18,427, GARRATT, workmen's time recording and wage computing apparatus. 18,590, CHUBB AND BONE, apparatus for the generation, condensation and storage of acetylene and other gases. 18,667, SÖRENSEN, water cock. 18,800, NORDMANN, process for the production of incandescent bodies for lighting purposes. 18,818, BAVERSTOCK, adjustable elevator. 18,902, MARTIN AND MARTIN, spark arresters for smoke stacks and chimneys. 19,288, FARMAR, slide rule for computing and calculating purposes. 20,480, CURWEN, electric arc lamps. 21,929, SAGE, water cocks and hydrants, in relation to their becoming frozen. 22,431, PUDDEPHATT, friction hoists, winches, &c.

1900.—1,969, GANTER, means for jointing and securing glass plates in show cases, show windows, &c. 2,524, ADAMS, taps or stop cocks. 3,005, STAINCLIFFE, house, stable and street gulley trap. 5,838, CONSENTIUS, appliance for facilitating the opening of doors. 7,733, BLACKBURN, artificial granite. 7,806, CROPPER, windows. 8,485, EDISON, method of and apparatus for grinding, screening, and re-screening very fine materials in bulk. 8,625, HEIN, automatic apparatus for forcing fluids any required heights or distance. 8,829, SKOPEC AND HERD, safety lock with electrical door-opening device. 9,422, FEBIGER, extinguishing of fires in closed compartments. 9,423, FEBIGER, extinguishing of fires occurring in closed compartments. 9,769, HUNT, conveyor, elevator and other chains. 9,989, HADDAN (*Huelsberg and Co.*), method of rendering wood, paper, &c., fireproof. 10,490, ALEXANDER, feeding apparatus for use on brick-making machines. 10,937, RUNDELL, window sash fasteners and ventilators. 11,088, WEIR, appliance for the opening and closing of skylight sashes. 11,110, BOULT (*Koyl*), process for the purification of water. 11,112, BOULT (*Koyl*), apparatus for softening and purifying water. 11,137, OLLIVER, dust bins and similar receptacles for rubbish and garbage.

Masters and Men.

To Counteract Trades Unionism.—The master builders of Birmingham and the Midlands are deeply interested in a scheme for the object of counteracting the spirit of trades unionism among their employees. At a conference at Nottingham some few days ago the scheme was formulated, and one of the main points is to get their foremen to leave the men's societies and join a new body to be formed by the masters. They are also to take other steps to combat trades unionism; but, curiously enough, while seeking to destroy combination among their employees, they are going to combine against the architects, who, they think, do not always treat them fairly.

Aberdeen Painters' Dispute. — Proceedings were recently taken in the Sheriff Court with regard to the funds of the old Operative Painters' Society, the members of which had joined the Scottish National Union of Painters. Some considerable time ago the old union of painters, which was purely a local one, resolved to give it up, and to join the National Union. They also intended to convey the funds to the new organisation. Certain members objected to that course, and raised an action of interdict to prevent the appropriation of the funds. Sheriff Burnet granted the interdict as craved, and a meeting of the men now resolved to appeal the case to the Sheriff-Principal.

The Wakefield and District Master Builders' Association held an ordinary monthly meeting on August 2nd. Mr. E. A. Elvey, the president, occupied the chair. Before the ordinary business of the meeting was commenced reference was made to the deaths which had occurred since the last meeting of Mr. Henry Sanderson, of Ossett, and Mr. Alfred Swallow North, of Castleford, who were members of the Association; and on the motion of Mr. J. Bagnall, seconded by Mr. G. Wilson, votes of sympathy and condolence with the bereaved families were passed. It was reported that the labourers' strike had been satisfactorily settled and that the men had resumed work on the old terms, except as to the rate of wages. It was decided to hold the next meeting of the members on the first Thursday in October.

Bristol Building Trade Disputes.—We have referred before to the negotiations which have passed between the Bristol Master Builders' Association and the various operatives in the building trade. Everything is now settled and copies of the new working rules are being issued to the parties interested. The rule as to disputes is as follows:—"Should a dispute at any time take place between any department of the building trade and their employers on any question of disputed interpretation or infringement of these rules that cannot be mutually arranged between the parties affected a Board of Conciliation shall be formed, composed of four employers and four members of the trade affected, to whom all questions shall be referred. The decision of the majority of such board shall be binding on parties concerned. Such Conciliation Board shall meet within 36 hours of the information being laid. That in case of an equal division, each body shall appoint an arbitrator, and the two arbitrators shall themselves, in case of disagreement, appoint an umpire. The decision of such arbitrators, if unanimous, or of the umpire, to be final, binding and conclusive."

Misapplying Trades Union Funds.—At the Marylebone Police Court last week, Thomas Donald, a member of the Battersea Vestry and the president of the General Labourers' Amalgamated Union, living in Golden Street, Battersea, was summoned at the instance of the trustees of the union for fraudulently misapplying the sum of £7 3s. 2d. The solicitor who prosecuted said that the defendant went to the Nine Elms branch of the union, and by representing that he had been sent by the central office to collect the money in hand he obtained various amounts, for which he had rendered no account. In addition, he had appropriated to his own use moneys he was authorised to receive from the same branch when an officer of that branch was in default. Evidence having been given in support of the statement, the defendant offered no defence, pleading in extenuation that, owing to lack of employment, he had got into debt and had kept the money in order to pay his creditors, who were pressing him. Mr. Fenwick remarked that the defendant ought to have protected the interests of the men belonging to the union and not robbed them: he ordered the defendant to repay the sum of £7 3s. 2d. and fined him 40s., with 20s. costs.—An order was also made at the instance of the same union against George Gibbs, of Cuthbert Road, Kingston, to refund a sum of £8 4s. 10d. and to pay a fine of 10s., with 20s. costs.

Surveying and Sanitary Notes.

Holborn—Strand Improvement: Progress of the Work.—Although some time must necessarily elapse before the great Strand improvement can be seen in all its glory, the work of removing Holywell Island is proceeding apace, and the public will soon be able to walk over ground which was erstwhile occupied by buildings of more or less historic interest. Nearly the whole of the houses on the north side facing the big establishment of Smith & Sons have been razed to the ground, and only the White Hart, the entrance to the Opera Comique, and a couple of shops remain to be taken in hand by the housebreaker before the whole length from St. Clement's to St. Mary-le-Strand will be cleared. The space to be thrown into the roadway is being paved with wood: the available space will be doubled, and a wide footway is being constructed at the side of the hoardings which are for the time being to hide the ugly and in some cases half-gutted backs of the houses which still remain in Holywell Street proper. There is not much in the removal over which the antiquary can grieve. None of the houses which have been razed had records of much interest, and they presented an incongruous mixture of various styles.

New Companies.

Crisp Browne, Limited.

This company was registered on August 2nd with a capital of £1,000 in £1 shares to acquire and carry on the business of an ironmonger now carried on at 43 Broadway, Wimbledon, S.W., as S. Crisp Browne.

L. H. Woodhouse and Co., Limited.

This company was registered on July 31st with a capital of £5,000 in £1 shares to take over the business of builders and contractors carried on at Hound Road, West Bridgford, Nottingham, and at Orange Street, Nottingham. T. V. Woodhouse is the permanent managing director.

Bullocks, Limited.

This company was registered on July 25th with a capital of £2,000 in £1 shares to carry on the business of builders, painters, decorators, oil and colour merchants, earthenware manufacturers, &c. The first directors (to number not less than two nor more than five) are A. E. Bullock, H. Watkins and G. B. Eccles (chairman).

Rowley Regis Granite Quarries, Limited.

This company was registered on July 18th with a capital of £120,000 in £1 shares to adopt and carry into effect an agreement made between the Carrara Marble Quarries Syndicate, Limited, and this company to acquire certain businesses mentioned in the agreement, and generally to carry on business as quarry owners, colliery proprietors, coke manufacturers, brick, tile and terra-cotta manufacturers. The first directors (of whom there shall be not less than four nor more than 10) are W. Bassano, S. Blewitt, J. Currall, W. Fitzmaurice, G. Law, jun., D. D. Rees and F. Bassano.

London Properties Development Corporation, Limited.

This company was registered on July 17th with a capital of £250,000 in £1 shares to acquire land, buildings and hereditaments of any tenure in the City and County of London and the metropolitan area; to construct or build and maintain offices, flats, houses, factories, warehouses, buildings, works and conveniences of all kinds; as bankers, financiers and concessionnaires, builders and contractors, dealers in stone, sand, lime, &c.; and as brick, tile and terra-cotta manufacturers, timber merchants, sawmillers and sawmill proprietors, jobmasters. The first directors (of whom there shall be not less than two nor more than seven) are to be appointed by H. Rydon, C. T. Hopkins and Co., F. W. Merriman and J. F. Seacombe, the first four signatories to the memorandum of association.

Nicholls and Clarke, Limited.

This company was registered on July 18th with a capital of £150,000 in £1 shares to acquire the business of lead, glass, paint, varnish, wall-paper, metal and general merchants, dealers and manufacturers, as now carried on at 1, 6, 7 and 8 High Street, 1, 2, 3, 4, 12, 13, 14 and 15 Blossom Street, and Elder Street and Fleur de Lis Court, Shoreditch, and at Brick Lane, Bethnal Green, under the style of Nicholls and Clarke, with all or any the assets and liabilities thereof, to develop and extend the same, and generally to carry on in all their branches the businesses of brokers, commission agents, oil and colour merchants, dealers in paints, colours, oil pigments, varnishes of all kinds, iron, brass and other metal founders, converters and workers, ironmongers, paper stainers, builders and contractors; to construct and maintain roads, sewers and other public and private works of all kinds; as chemical manufacturers, engineers and ironfounders, tube and wire drawers. The first directors (of whom there shall be not less than three nor more than seven) are S. Nicholls, S. H. Nicholls and J. L. Lythgoe. Registered office: 6 High Street, Shoreditch.

Wells Lime Company, Limited.

This company was registered on July 31st with a capital of £500 in £1 shares to acquire from J. E. Kitton a lease of a brickyard at Wells-next-the-Sea, Norfolk, and to carry on the business of lime burners, brick, tile, whiting, pottery and cement manufacturers, &c.

London General Financial Corporation, Limited.

This company was registered on August 3rd with a capital of £1,000 in £1 shares to acquire land, buildings and property in London or elsewhere, and to carry on the business of builders, financiers, &c. The first directors (to number not less than three nor more than five) are to be appointed by the subscribers.

Retford Real Estate Company, Limited.

This company was registered on July 25th with a capital of £5,000 in £10 shares to acquire any property in the county of Nottingham or elsewhere, and to carry on the business of builders, contractors, warehouse, bank, store, shop and office fitters, &c. The first directors (to number not less than three nor more than thirteen) are to be appointed by the subscribers.

New Cwmgorse Colliery Company, Limited.

This company was registered on July 25th with a capital of £10,000 in £10 shares to carry on the business of colliery proprietors, miners, fuel, brick, gas, coke and coal tar manufacturers, iron and steel converters, smelters, founders, engineers, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers.

North Wales Paving Company, Limited.

This company was registered on July 30th with a capital of £10,000 in £5 shares to acquire the concrete works of the Shap Granite and Patent Concrete Company, Limited, of Penmaenmawr, and to carry on the business of limestone, slate and mineral merchants, &c. The first directors (to number not less than two nor more than five) are G. O'Dwyer Briggs and N. Brooke (managing directors). Registered office: Chirk, Denbigh.

J. J. Stockall and Sons, Limited.

This company was registered on July 24th with a capital of £25,000 in £1 shares to acquire the business carried on by J. J. Stockall, T. J. Stockall and W. H. Stockall at 6 to 8 Clerkenwell Road, E.C., and elsewhere, as J. J. Stockall, and to carry on the business of jewellers, clock and watchmakers, gold and silversmiths, opticians, &c. The first directors (to number not less than three nor more than seven) are T. J. Stockall, W. H. Stockall, W. B. Griffiths and J. J. Stockall, jun.

Cheadle Collieries, Limited.

This company was registered on July 31st with a capital of £200,000 in £1 shares to carry on the businesses of coalmasters, colliery proprietors, ironmasters, steel makers, steel converters, coke manufacturers, brick, tile and terra-cotta manufacturers and dealers. The first directors (of whom there shall be not less than three nor more than seven) are to be elected by the signatories, C. Streete, C. Laidlaw, S. Longhurst, F. W. Mould, R. T. Parker, A. Potter Hatton and E. A. Brett. Registered office: St. George's House, Eastcheap.

Gardner Electric Drill and Hammer Company, Limited.

This company was registered on July 28th with a capital of £40,000 in £1 shares to acquire certain inventions and improvements relating to electric power, rock drills and electric hammers, and to carry on the business of mine owners, mining and mechanical engineers, manufacturers, smelters, refiners, metallurgists, contractors, mineral and ore merchants, &c. The first directors (to number not less than two nor more than five) are F. L. Gardner, A. Gaskell and F. L. Roudebush.

Thomas Saul and Son, Limited.

This company was registered on July 18th with a capital of £50,000 in £5 shares to acquire the business of timber merchants, &c., carried on by T. and T. J. Saul at Great Yarmouth, and generally to carry on the businesses of timber importers and merchants, sawmillers and sawmill proprietors, manufacturers of and dealers in cement, hardware and building materials of every description; as iron and steel merchants, builders and contractors, joiners, slate merchants, brick, tile and terra-cotta merchants, engineers and ironfounders, metal workers, wire-drawers and tubemakers. The first directors (of whom there shall be not less than three nor more than five) are L. W., C. L., T. and T. J. Saul. Registered office: Sawmill Offices, Sawmill Road, Cobholme, Great Yarmouth.

G. H. Bickerton	£1,780	John Gethin	£1,694
Geo. Bullock	1,727	R. Price & Sons *	1,660
Henry Price	1,699	[All of Shrewsbury]	

* Accepted.

SMITHAM BOTTOM (Surrey).—For the erection of two houses, one shop, office, stabling, &c., Brighton Road, Smitham Bottom, for Mr. T. H. Ebbutt. Mr. C. H. Ridge, architect, 17 Park Street, Croydon :—

J. Burton & Son	£3,425	E. P. & C. Balled, Croydon*	£3,290

* Accepted.

WARMINSTER.—For the erection of a residence, Boreham Road. Mr. H. F. Price, architect, Weston-super-Mare. Quantities by architect :—

Cock & McLean	£2,830 0 0	G. & J. E. Stokes	£2,523 0 0
P. J. Ponton	2,738 15 2	Butcher & Son	2,475 2 10
J. Gaisford	2,703 0 0	C. Addicott, Weston-super-Mare *	2,404 8 0
Parsons & Son	2,684 9 7		
H. Franklin	2,675 16 5		

* Accepted.

CONTRACTS OPEN.

LEXDEN and WINSTREE RURAL DISTRICT COUNCIL.
TO BUILDERS AND CONTRACTORS.

The above Council invite TENDERS for BUILDING TWO NEW STEEL GIRDER BRIDGES, with abutments, &c., complete, in the Parish of Boxted.

Plans and specification can be seen at the Office of Mr. JOHN ENNALS, Surveyor, Copford, or at my Office on SATURDAYS.

Sealed Tenders, endorsed "Tender for Bridge," to be sent to the undersigned not later than TUESDAY, the 21st AUGUST.

The Council do not bind themselves to accept the lowest or any Tender. By order,

CHAS. H. THOMPSON,
Clerk to the Council.

Victoria Chambers, Colchester,
August 1900.

PARISH of ST. LEONARD, SHOREDITCH.
TO BUILDERS.

The Guardians of the above Parish invite TENDERS for ALTERATIONS at their Infirmary, 204 Hoxton Street, N.

Plans and specifications may be seen and all information obtained at the office of Mr. F. J. SMITH, F.R.I.B.A., Parliament Mansions, Victoria Street, S.W., upon payment of £5, to be returned to persons bonâ-fide tendering.

Sealed Tenders, upon the forms supplied, must be delivered to the Guardians at their meeting to be held at the Board Room, 204 Hoxton Street, N., on WEDNESDAY, the 22nd inst., at FIVE o'clock in the afternoon precisely.

The Guardians do not pledge themselves to accept the lowest or any Tender.

By order,
ROBERT CLAY,
Clerk to the Guardians.

Clerk's Office,
No. 213 Kingsland Road, N.E.,
August 1900.

FENNY STRATFORD SCHOOL BOARD.
TO BUILDERS AND CONTRACTORS.

The above-named Board invite TENDERS for the ERECTION of a New GIRLS' SCHOOL at Fenny Stratford. Plans and specifications, as prepared by Mr. JOHN CHADWICK, M.S.A., Fenny Stratford, may be inspected at my Office between the hours of TEN a.m. and FOUR p.m.

Application for bills of quantities and form of Tender, accompanied by the sum of £2 2s. (which will be returned on the receipt of a bonâ-fide Tender and priced bill of quantities), to be made to me the undersigned.

Sealed Tenders on the forms supplied, together with priced bill of quantities, to be delivered at my Office on or before TWELVE o'clock noon, TUESDAY, AUGUST 21st, 1900, endorsed "Tenders for School."

No pledge given to accept the lowest or any Tender.

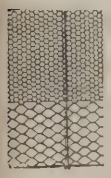
August 1900. THOS. BEST, Clerk.

TO BUILDERS and CONTRACTORS.

The Vestry of Lambeth are prepared to receive TENDERS for the EXECUTION of certain WORK at the PUBLIC BATHS and WASHHOUSES at the corner of the Kennington and Lambeth Roads, plans and specifications for which may be seen at the Offices of the Architect, A. HESSELL TILTMAN, Esq., 51 Russell Square, between the hours of TWO and FOUR o'clock in the afternoon.

Parties desirous of submitting Tenders may obtain Forms of Tender and Bills of Quantities at the Architect's Office on payment of £2 2s., which sum will be retained by the Vestry and forfeited if a bonâ-fide Tender is not made by the parties depositing the same.

No Tender will be considered except upon the prescribed form.



Sealed Tenders must be delivered at the Lambeth Vestry Hall, Kennington, addressed to the undersigned, not later than TWELVE o'clock at NOON on THURSDAY, the 6th SEPTEMBER.

The Vestry reserves to itself the right to decline all or any of the Tenders sent in.

HENRY J. SMITH,
Clerk to the Vestry.

Lambeth Vestry Hall,
August, 1900.

ASYLUMS COMMITTEE, LONDON COUNTY COUNCIL.

TENDERS are invited for the ERECTION of an OAK PARK PALED BOUNDARY FENCE, GATES, and FOUNDATIONS at the Horton Estate, near Epsom Surrey.

Instructions for Tender, and forms of Tender and contract, with specification, can be obtained from the undersigned on and after the 13th inst. A plan showing the position and approximate length of the fencing may be inspected at the Office of the Asylums Engineer, 6 Waterloo Place, S.W.

Tenders must be on the printed form, and be accompanied by the form of contract and schedules thereto and form of bond.

The Tender, completed in accordance with the instructions, must be enclosed in the authorised cover, sealed and endorsed "Tender for Oak Paled Fence, Horton Estate," and be delivered at the Office of the Committee, 6 Waterloo Place, S.W., not later than TEN a.m. on SATURDAY, the 22nd SEPTEMBER, 1900, after which time no Tender will be received.

Any Tenders not made on the printed forms or not filled up and completed in every particular in accordance with the instructions, will be rejected.

The contractor will have to enter into a bond in the penal sum of £250 with two approved sureties, each in the sum of £125, as security for the due performance of the contract.

The Committee do not bind themselves to accept the lowest or any Tender.

R. W. PARTRIDGE,
Clerk of the Asylums Committee.

Asylums Committee Office,
No. 6 Waterloo Place, S.W.
August 1900.

TAUNTON CORPORATION WATER WORKS.

The Taunton Town Council are prepared to receive TENDERS for the CONSTRUCTION of a STORAGE RESERVOIR and other Works at Luxhay, Pitminster, about six miles from Taunton.

Drawings may be inspected and specification and schedules of quantities and forms of Tender may be obtained at the Offices of the Engineer, Mr. F. W. ROBERTS, Taunton; or of the Water Works Manager, Municipal Offices, Taunton, upon payment of £2 2s., which will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, upon the form supplied, addressed to the Town Clerk, Municipal Buildings, Taunton, and endorsed "Tender for Reservoir," must be delivered on or before MONDAY, the 27th day of AUGUST instant.

The lowest or any Tender will not necessarily be accepted.

GEORGE H. KITE,
Town Clerk.

COUNTY BOROUGH of WEST HAM.
TO CONTRACTORS.

The Council hereby invite TENDERS for the CONSTRUCTION of about 4,700 lin. feet of 12-inch STONEWARE PIPE SEWER, with MANHOLES, in Barley Lane, Chadwell Heath.

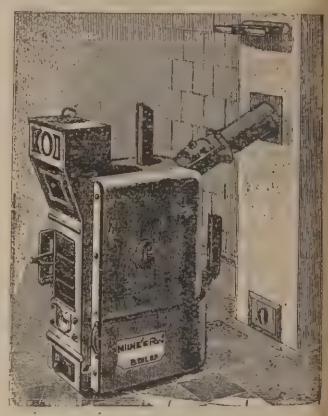
Plans may be seen, and specification, form of Tender, and further particulars obtained at the Borough Engineer's Office, Town Hall, West Ham, E., upon payment of One Pound, which will be returned upon the receipt of a bonâ-fide Tender.

Tenders, endorsed "Tender for Sewer, Barley Lane," to be sent to my Office not later than FOUR o'clock on MONDAY, AUGUST 27th, 1900.

The Council do not bind themselves to accept the lowest or any Tender.

The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

The contractor whose Tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages, and observe such hours of labour, as are recognised by the workmen's trades unions, and shall not assign, nor underlet, or make a subcontract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.



By order of the Council,
FRED. E. HILLEARY,
Town Clerk.

Town Hall,
West Ham, E.,
August, 1900.

An Architectural Causerie.

Differences in House Design.

Architecture, an expression of human life, manners and customs, assumes varying forms and adopts varying methods to express the varying conditions of the life which it represents. The conditions of life in the cities being so entirely different from those in the country districts, the expression of these different conditions naturally produces different results. The civilised inhabitant of the city is not the same being as the man who lives in the wilderness. Society has to some extent modified his character and imposed certain restrictions on his conduct. The man who lives in absolute solitude is the only man who is absolutely independent and self-sufficient and so at liberty to do as he likes or to build as he likes. He need not consider other people when there are none to consider. The more secluded his dwelling the more his individual life tends to develop as a separate, self-centred and independent entity, thinking and acting without deference to others. But the nearer he lives to other people the more does he become dependent on them, the more his thoughts and actions are influenced by them, till in the great centres of life he simply could not exist without their assistance; consequently, his independence vanishes and his individual life merges in the common life. Civilisation only exists on the understanding that the interests of the individual are subordinated to the common welfare, and this subordination seems to be in proportion to the dependence of the individual on the community. Hence the inhabitant of the city can no longer be regarded as a separate entity. He is little more than a bee in a hive and his house than a cell in the honeycomb. This fact necessarily influences his dwelling and influences the methods and aims of the artist who designs it. The man in the country may be a more or less independent entity and his house may express it; but the man in the town is not, neither is his house. It is not for the artist to deplore this fact, but to express it. In more or less civilised countries men who live on their own estates, in secluded spots far from the centres of life, can and do behave very much as they please. If other people do not approve of their manners and customs they do not go near them. But the moment such men come into contact with their fellows their conduct must be modified. Such a man's own house, hidden from public view in his own grounds, may be as eccentric and as ugly as he pleases, no one need see it but himself; but if he build a lodge at his entrance gates he is at once bound to consider those who pass by. There are limits, however, even to this private licence. In conduct there are the limits laid down by the law of the land, and besides this it is felt that the mere knowledge of the fact that anyone is guilty of outrageous behaviour in his own house constitutes an offence to others. So in building; simply the knowledge of the existence of a house that is an outrage on good taste is felt to be an offence, even though one had never seen it. Within the limits of decency, however, the more secluded a man's dwelling is the more he is at liberty to indulge his own fancies and fads and develop his individuality, both in his conduct and his building operations; but the nearer he lives to other people the less scope is afforded him for the display of either. The owner of a house hidden away in private grounds is not only free to express his own tastes uninfluenced by others, but the artist is also free to design it without reference to other and pre-existing designs. It may be a complete work of art in itself, as a single figure in sculpture may be; it can be designed solely with reference to its own unity. But directly another building or another figure is introduced the conditions alter absolutely; the two objects have to be designed with reference to one another—they have to compose. There is nothing more wearisome than the continual contemplation of a collection of works of art, all of which have been designed without any consideration for one another—as witness the Academy headache. To allow buildings to occur at haphazard is not art and to arrange independent designs so that they interfere with one another as little as possible is no more than arranging a picture gallery or a museum. It is this which seems to give direction to the architect's aim when designing town houses. He has to remember that he is not free to do as he likes; that the same restrictions that are placed on his client's conduct are placed on his own. He must realise that he is not creating something entirely new and independent. He finds a complete creation—the city—the individual units of which—the houses—are continually decaying, but whose collective life continues. His occupation is to renew these decaying members in harmony with the whole, but not to design a fresh and independent work of art, as is the case with an isolated building in the country. He has to express his client's existence as a most insignificant unit of the thousands that go to make up the collective life of the city; he has to show that deference to other designs that his client shows to other people. From this point of view it would seem that the man who would introduce a staring and petulant red brick house into a street of dull and uniform stucco work is akin to the man who keeps fowls in his area or who performs on the cornet in his back garden—he is indulging his own taste at the expense of his neighbours. It may well be that the red brick house is a more interesting work, in itself, than any of the houses forming its surroundings, but it is out of tone—out of harmony—and where there is no harmony there is no art. Possibly the owner, or the artist, said to himself, "How dull is this street; let us have at least one touch of colour to lighten it up a bit"—precisely what is said by the man who enlivens

THE PORCH, BUCKSHAWE HALL, LEYLAND. DRAWN BY FREDERICK J. BARNISH.

the twilight hours with the dulcet strains of his concertina. It is by no means the architect's business to instruct his client in the elementary laws of civilisation and good citizenship. He is not necessarily a censor of morals; his primary concern is to reflect and express life as he finds it—to hold the mirror up to nature. If, therefore, his client demands something startling it may be considered his business to provide it; and such houses have at least this claim to be called art, that they do thoroughly express the character of their occupants. But while the owner is uncivilised and out of harmony with his surroundings his dwelling must necessarily be so too if it would reflect his nature. From the social point of view it might rather be said that, though the inside of one's house may be designed to please oneself, yet the outside must be designed to please one's opposite neighbours, who see a great deal more of it than we do ourselves. But the architect must never forget that in a city these startling expressions of individual opinion are out of place and therefore inartistic. They may be clever and "original," but the more clever they are the more they destroy the harmony of the whole conception, not only of the city, but of the larger harmony of the universe. They degrade a street to the level of a picture gallery, and a picture gallery where the pictures have not even frames to separate them. A private dwelling in a town which stands out from its surroundings cannot but be a vulgarity; and it is also artistically untrue in this way, that it usually denotes more individuality in its owner than he can ever possess. If his character and his conduct were as eccentric and out of harmony with their surroundings as is the appearance of his house he would not be living in it; he would be in the hands of the police or in Colney Hatch. The distinguishing mark of a gentleman is that he has no distinguishing mark. He is never out of place, he is never assertive. His house should be like him. The artist designing in the country may consider himself as a soloist, but in the city he is but a member of an orchestra, who must follow the beat of the conductor's baton. While, then, a private house may fitly reflect individual sentiment within the limits of sense and right feeling, it is not so in public buildings, buildings for collective use, which have rather to reflect the sentiment and express the life of the community. Strictly speaking, there are no public buildings in the country. Buildings for collective use are naturally placed where men collect together, and so are to be found in villages and towns. A few isolated churches, or possibly wayside inns, might be held the necessary exceptions; but even these were probably not built in such utter solitude as that in which we now find them. Public buildings, therefore, have not only to express the public sentiment, but they have also to be in harmony with and make some concession to surrounding buildings. Individual fancies and conceits would seem to be quite out of place here, and therefore not really artistic. It is in designing public buildings, perhaps, that the architect's greatest satisfaction is to be found—to so enter into the life of the community that one's own personal failure and disappointment count for nothing, in comparison with the success of the life of humanity, which, through whatever misfortunes it may experience, rises ever with renewed strength and an eternal freshness of youth. In reflecting some glow, however faint, of this bright and eternal youth, the artist may surely find a larger opportunity and a deeper satisfaction than in expressing the fancies of an individual or the passing whim of the moment. A. R. J.

On Reflection.

Vauxhall Bridge Again?

For some time past a gracious peace has been our lot in regard to the new bridge across the Thames at Vauxhall, but now there is a risk of the spell being broken. It will be remembered that the old bridge, with its nine iron arches supported on stone piers (which by the way occupied one-sixth of the waterway), was condemned as unsafe owing to the foundations having become undermined by the currents, and that after a design for a steel-arched erection was rejected (in July, 1897) the London County Council approved the design prepared by their engineer-in-chief, Sir Alexander Binnie. This showed a concrete bridge faced with granite, and though the construction received much approbation the architectural qualities—particularly the general scale and the mouldings—were extensively and adversely criticised, architects of repute affirming that the bridge would not be worthy of its position and its use. There was a good deal of correspondence between the Council and the Royal Institute of British Architects on the subject, the greater part of which, however, was confined to an iron bridge with stone piers, and not to the concrete one, a model of which was only examined by Mr. Waterhouse and Mr. Mountford, whose opinions, given confidentially, were after published as representing the views of the Institute. Certain modifications and suggestions were adopted, and then, as the Council remained as obdurate as the Academy, the matter died down and became no more than a memory. Now the buried is perhaps to be dug up again. The time fixed for getting in the foundations and completing the piers and abutments was two years and a-half, of which only seven months remain. But not half the work is done yet. The reason for this is that the contractors (Messrs. Pethick Brothers, of Plymouth) found that instead of the blue clay being where it should have been it was 16ft. lower down, and instead of excavating and filling up with concrete (the expense of which would have been very great) piles were sunk and the pier built on top. At the present time four of the old piers and part of another are still in the river, the diversion of the sewers will take about four times as long as was estimated, and instead of the foundations taking two years and a-half to complete it looks as if double the time will be necessary. This means that the contractors will have to pay penalties, or (what is more probable) be granted an extension of time, and without doubt this will be the cause of more discussion. The contractors will say that it is not their fault, and the engineer will plead the impossibility of pre-determining the nature of river beds: in the meantime those who have to pay for the extras will not forget to mention the fact.

Another Competition Fiasco.

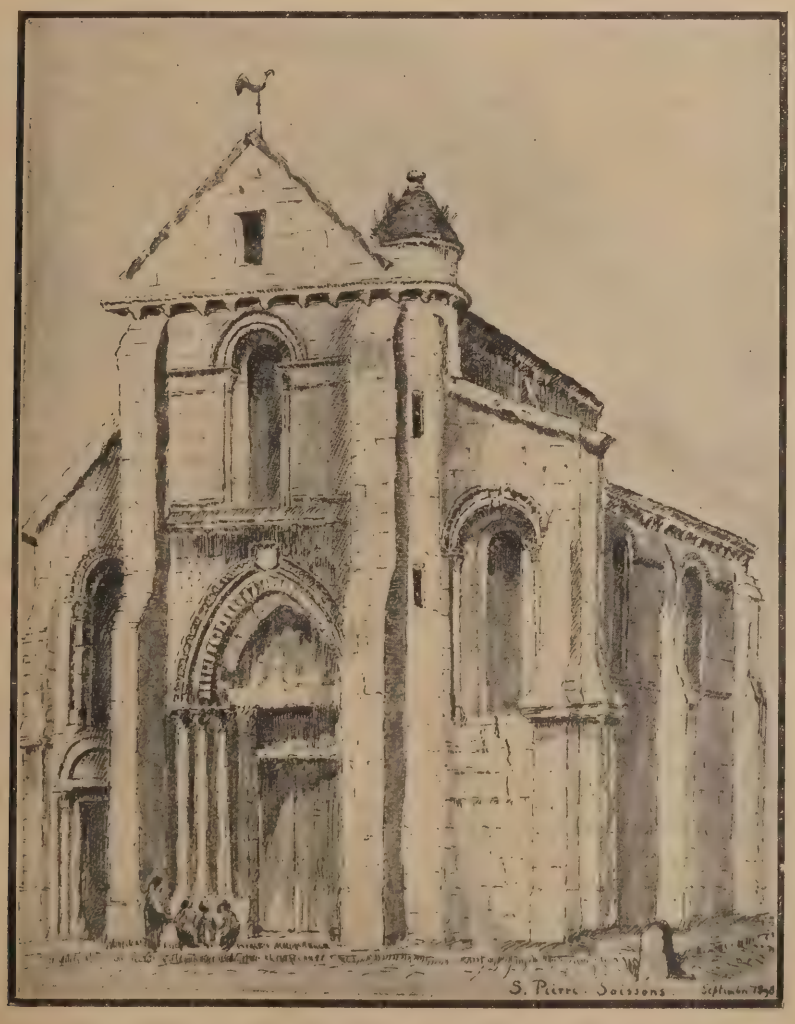
The Eastbourne Town Council is the latest public body to make itself ridiculous over a competition. "Man wants but little here below" is a maxim that is now behind the times. The Eastbourne Council requires a Free Library, an Art School, Technical Institute and Fire Engine Station all for the sum of £20,000. Moreover, the first three are to be under one roof. And not content with setting the competitors this puzzling problem the Council specified the floor-space required in each room. The first premium was won by Mr. P. A. Robson, and the assessor, commenting upon his design, says: "The author of this design has adhered with the greatest exactitude to your instructions, and has not only provided the floor-spaces you require but has also in almost every instance succeeded in giving you the exact dimensions given in your printed instructions." The building is also commended for its lighting, its economy and compactness. But this does not please the Eastbourne Council. It wants an ornamental building, and we all know what that means. Councillor Maude said: "It would be a thousand pities, if when the building was erected, they would in a short time be tired of looking at it. Among the plans there were many much more ornamental in appearance than those selected, and which would commend themselves far more to those who had any taste in the matter." Councillor Welch made a stand for the architect, but without avail. The Eastbourne councillors must understand that each of the buildings they require needs a different architectural expression, and should stand by itself. If they cannot afford this they must put up with plain construction; the conditions preclude any hope of a building possessing architectural feeling. At present the whole matter is in abeyance and the ratepayers are to be communicated with, but if they will elect such men as these councillors to represent them the outside world is justified in judging Eastbourne by the acts of its Council.

More Light.

A grave defect in public street lighting by means of the electric light forms the subject of a paragraph in the current number of "The Liberty Review." Our contemporary says that "the method of applying it (the electric light) in the streets is ugly and inconvenient to the last degree. At immense distances apart are fixed arc lamps of overwhelming strength; the glare of white light is blinding for a few seconds; then we pass into darkness, then into the glare again, and so on. The only satisfactory mode would be by reviving the old double line of lamp-posts, with an *incandescent* lamp upon each, the wires being taken through the interior, as the gas-pipe is now. In this way we should regain the old beautiful effect of a long avenue of lights at night; the light itself would be far pleasanter to the eyes and it would be diffused, as all street lighting should be." We have more than once called attention to this anomaly ourselves. The reason for so arranging the lights doubtless hinges on the fact that one arc light is equivalent in power to many gas burners, and the authorities accordingly enormously increase the distance between the lamp-shafts. This concentration of light is opposed to all scientific reason, for it simply means a greater dead-point and more intense darkness between the lamps. But the whole system is open to question. As we understand it, the reason for adopting the electric light in the streets at all is to increase the amount of light, not to keep it at the present strength as the authorities endeavour to do, or to diminish it, as by ignoring the effects of concentration they succeed in doing. Our object is to provide light for the passenger and vehicular traffic, not to illuminate the housetops every hundred yards or so. We are not inclined to accept with the childish enthusiasm of the "Daily Mail" the erection of an arc lamp as an evidence of progress, and it may interest that contemporary to know that the St. Martin's district is much worse lighted by its much-belauded arc lights than it was by the old gas lamps. We sincerely trust that the Strand Board will not follow the foolish example of its neighbours when its electric-light scheme is completed.

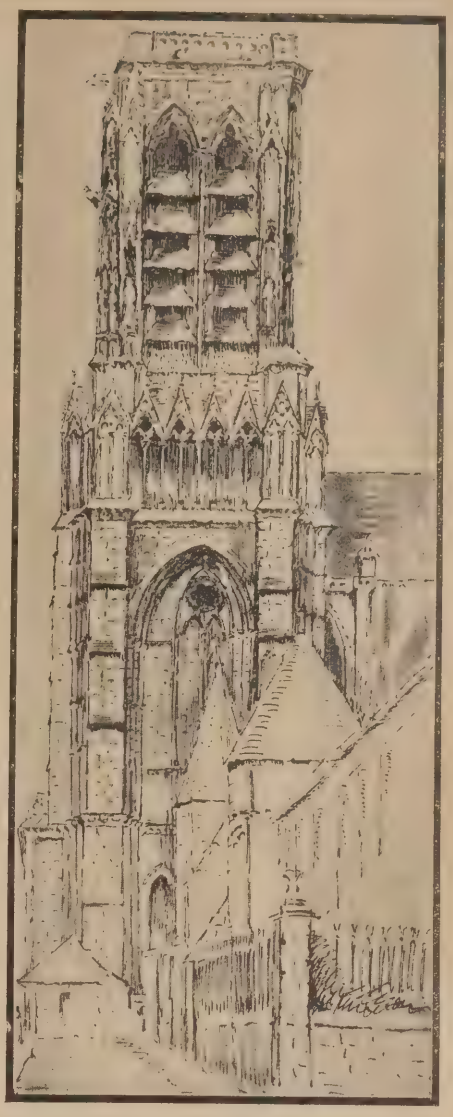
TOWNS OF NORTHERN FRANCE.

By ERNEST T. MARRIOTT, M.A.



WHEN the dog days are upon us, when London towards the West is shut up, in the East is a sweltering mass of humanity, what better thing than to go for a trip through Northern France with a bicycle? Dining in London and leaving Southampton at midnight, one escapes from the meshes of the "Douane" at Le Havre in time for an early breakfast. Havre is not an appetising "hors-d'œuvre" for the commencement of a trip somewhat architectural. But, on the first day abroad, what need to open a sketch-book? Just rub your eyes, grow accustomed to the change of scene and colouring; get your ear turned to the language; send off your heavy luggage to meet you at some further point in your trip, taking sketching materials and the absolutely necessary impedimenta on your bicycle, and sally forth to spend the night in a more congenial atmosphere. So, to Lillebonne, a small town about twenty miles east of Havre. The student of ancient Roman monuments will find here a tolerably perfect amphitheatre—in fact, Murray tells us that it is the best preserved and indeed almost the only example of an ancient theatre in the North of Europe. No Englishman should leave Lillebonne without paying a visit to the Castle, where the Conqueror held solemn conclave, discussing with his barons the preliminary business for the attack on Britain. But with the exception of a round tower with walls 13ft. thick little remains of the original. From the terrace one obtains a fine view of the valley of the Seine. The fifteenth century double portal of the parish church is interesting.

A short evening ride brings us to Caudebec-en-Caux. This place is so well known that it is superfluous to dwell on its merits. A spin of two hours, through lovely pastoral country and great open fields, brings Rouen into sight—a city which has recently been dealt with in these columns.

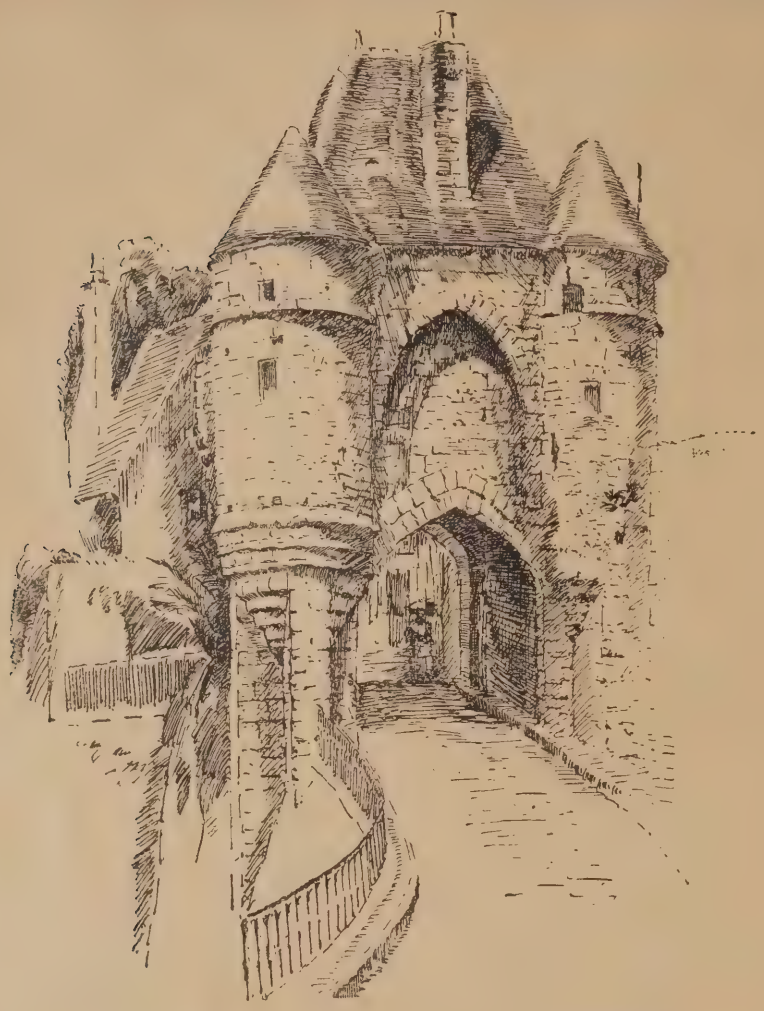


Riding eastwards for fifty miles, passing Gournai (of cheese fame) *en route*, we come to Beauvais, a town teeming with historical associations, full of fine old buildings and innocent (as yet) of electric trams. Froissart, referring to the suppression of a great revolt here in 1357 of the serfs against their lords, remarks:—"They set fire to the town and burned it clean, and all the villagers of the town that they could close therein." Mercifully, this is not strictly true, for the old cathedral, begun in 1225, still rears up her head, rears it up rather high too, for the choir is the loftiest in the world; that, together with the two transepts, constitutes the cathedral, as it has never been finished. The vaulting of the roof collapsed in 1284, so slender were the supports, but it was built up again, additional piers being added. Ruskin in "The Seven Lamps of Architecture" has remarked that there are few rocks, even among the Alps, that have a clear vertical fall as high as the choir of Beauvais. As a matter of fact, the roof rises 153ft. above the pavement.

When one has had time to recover from the feeling of amazement at this "Colossus on tiptoe," there are many details about the cathedral worthy of particular attention—e.g., the portal of the north transept, retaining the original doors; the elaborate Flamboyant south portal; the stained glass, which, as a rule, is admirable; the tapestry hanging in the transept, which reminds one of the long famous tapestry manufactory at Beauvais. The traveller should also visit the church of St. Etienne with its transitional (from Romanesque to Gothic) nave. The whole town is full of streets of overhanging half-timbered houses, some of which are well worth the study of the architect, and all of which appeal to the artist.

But we must push on to Compiègne, forty-two miles east, stopping for a while at Clermont, a town which possesses (so the guide book says) the oldest hôtel-de-ville in France.

S. PIERRE, SOISSONS. DRAWN BY ERNEST T. MARRIOTT.



SOUTH-WEST TOWER OF CATHEDRAL, SOISSONS. DRAWN BY ERNEST T. MARRIOTT.

If the flavour of Beauvais is mediæval, that of Compiègne is what one may describe as Watteauesque. Louis XV.'s palais, built by Gabriel, rather dominates the placé. Yet two other buildings at least deserve attention—the Church of St. Antoine and the Renaissance Hôtel-de-Ville.

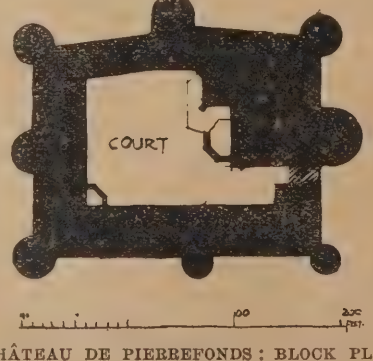
Louis N. Stevenson in his "Inland Voyage" says:—"My great delight in Compiègne was the town hall. I doted upon the town hall. It is a monument of Gothic insecurity, all turretted and gargoyled and slashed, and bedizened with half a score of architectural fancies. Some of the niches are gilt and painted, and in a great square panel in the centre, in black relief on a gilt ground, Louis XII. rides upon a pacing horse. . . . Over the King's head, in the tall centre turret, appears the dial of a clock; and high above that, three little mechanical figures, each one with a hammer in his hand, whose business it is to chime out the hours and halves and quarters for the burgesses of Compiègne. . . . I had a great deal of healthy pleasure from their manœuvres, and took good care to miss as few performances as possible."

Far more pleasant is it to wander about the grounds of the palace and to dream of the fêtes of long ago than to pass through the semi-bare rooms of the palace itself, with the "sic gloria mundi transit" feeling forced upon one at every corner.

No wonder the Napoleons were devoted to Compiègne with such a forest for "la chasse." How lovely it looked in the early morning as we rode through it for an hour on our way to Pierrefonds. There, on a hill, that huge hulking impersonation of Feudalism, the Château of Pierrefonds, stands. It is impossible to get away from it. Outside and inside, with all the decoration, fittings, and furniture, it is to-day

PORTE D'ARDON, LAON. DRAWN BY ERNEST T. MARRIOTT.

as it was in the fifteenth century. The restoration was carried out by Viollet-le-Duc at a cost of five million francs. Those who would sketch in the precincts of the château must obtain an official order from Paris. There is nothing of exceptional interest in the village of Pierrefonds, so we pushed on to Senlis the same evening.



Perhaps the most remarkable feature about this little provincial town, about forty miles north of Paris, is the number of fine churches which have been desecrated. St. Vincent, St. Pierre, St. Frambourg—all interesting, and two dating from the twelfth century—are used respectively as a theatre, a riding-school, and a vegetable market. The scene in St. Frambourg on a market morning, with the fruit and vegetable stalls ranged down the nave and round the aisles, the market-women with spotless white caps and bright coloured aprons sitting at the bases of the piers, fruit and vegetable of every colour spread around them, the gay crowd flitting about from one stall to another, everyone talking at the highest pitch of voice, makes up a striking and animated scene, one which would fill the painter with enthusiasm and perhaps sadden the architect, for in a church put to such a purpose surely but little attention will be given to the preservation of architectural details. If the roof and walls hold good, the church can always be used for a vegetable market—that is enough.

The cathedral is small but quite interesting. The splays of the twelfth century west portal retain their carved statues with a trace of colour. The west façade is singularly charming. It has escaped both the restorer's and the spoiler's hands. Inside one notices that the choir is longer than the nave. The triforium is as wide as the aisle beneath; some of the capitals are interesting, and the east end is apsidal in form.

We did not discover any domestic work here worthy of particular attention. Before leaving Senlis the cyclist ought to ride over to Chantilly (eight miles off) to see the late Duc d'Aumale's château, which was thrown open to the public some time ago. There are some very fine pictures, a magnificent library and a dainty collection of bric-à-brac. The park, too, is delightful.

About forty miles north-east of Senlis lies Soissons. Few of us in early youth have not read of the inhabitants of this part of France, for did not Cæsar himself find the king of the Suessiones the most powerful monarch in Gaul? This fact speaks well for the antiquity of the town, and during successive centuries Soissons appears to have been the favourite butt for attacking parties in this region. It has the misfortune to hold a commanding position on the river Aisne. As a consequence, the town has been sacked by the Huguenots, twice taken and retaken in a week during the campaign of 1814, and finally bombarded in 1870. With such a record (not to speak of the furies of the first revolution) what wonder if most of the good things have disappeared?

But there is a west front here flanked by two towers with spires superimposed which alone would make the place worthy of a visit. This is the remnant of the thirteenth century abbey church of St. Jean des Vignes—a superb remnant too. The Suessiones did well to pray the spoilers, "At least spare this."

CHÂTEAU DE PIERREFONDS: BLOCK PLAN.

The cathedral is remarkably interesting. It is one of the earliest existing examples of Early French work. The choir was finished in 1212. J. H. Parker has said that nearly all the churches of the Soissonais district are of the character of transition from the Romanesque to the Gothic, and some of the most learned of the French antiquaries consider that this district was the birthplace of Gothic architecture. "It is to be regretted," he adds, "that they have not more carefully investigated the history of these churches." And as we look at the very beautiful south transept rounded off in apsidal form, built between 1168 and 1175, with its four series of acutely pointed arches rising one above the other, all resting upon slender shafts, it requires but slight imagination to assure oneself that this very spot *is* the birthplace of the Gothic style.

St. Pierre, not far off, is an interesting half-Romanesque church. It is now used for a gymnasium.

Ten miles from Soissons is the Château de Coucy. Enough of it remains to give point to the motto of the Sires of Coucy—

> "Roi ne suys,
> Ne prince, ne duc, ne Conte aussy;
> Je suys le sire de Coucy."

The donjon, which is 180ft. high and 100ft. in diameter, the walls in places being 34ft. thick, is still virtually intact. Viollet-le-Duc thought it the finest bit of mediæval military architecture in Europe: "Compared with this giant," he says, "the largest towers known appear mere spindles." Even the gunpowder which Mazarin's engineers brought to bear upon it had but little effect. It is an interesting fact that this château was bought from the Sire of Coucy by Louis of Orleans, the same who built the Château of Pierrefonds. The love which this Louis must have had for magnificence was surely as great as that of the late King of Bavaria.

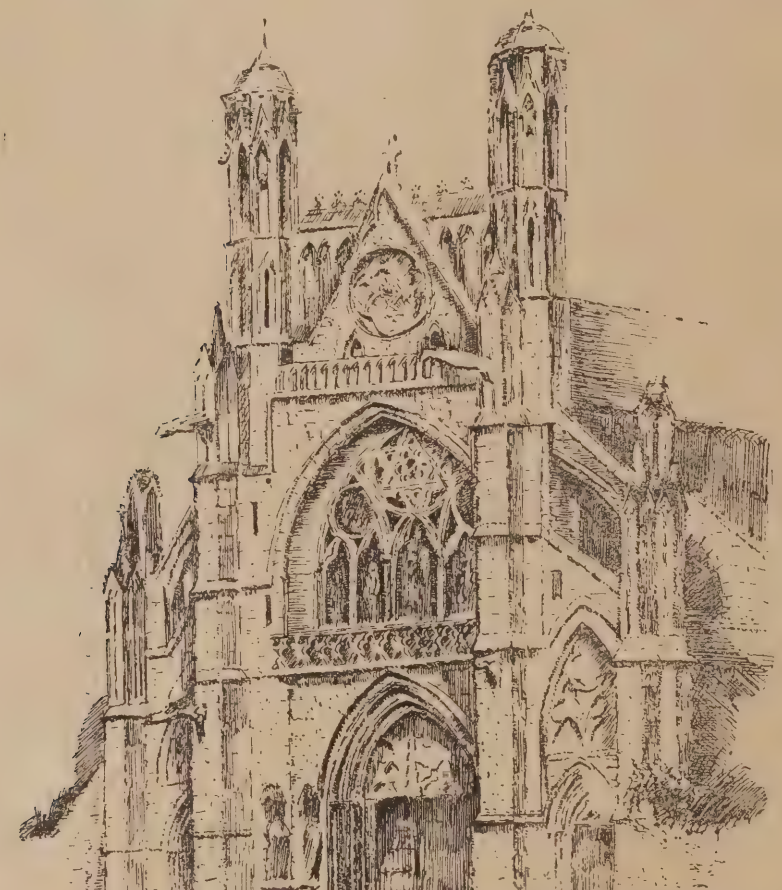
And now to Rheims; but no! in a short article of this kind one cannot even touch the hem of the garment of such a city, such a cathedral. A long monograph dealing with the cathedral, the Church of St. Remi, and other buildings would offer but scant justice to such subjects. For the rest, Rheims is a great contrast to the quiet provincial towns which we have been visiting. Here is all bustle begot of commerce, and Champagne is writ large in the streets.

A thirty-mile ride in a westerly direction brings us to Laon.

Joseph Pennell has called Le Puy the most picturesque place in the world. Certain places seem to hold the secret of being able to take possession of one's whole being—Oxford, Rothenburg, Florence, and I would add Laon. During our eleven days here, the visitors (those at least who were English) came as veritable birds of passage, never spending more than two nights, generally one, for Laon lies on the main line from Calais to Bâsle. To them, Laon, I feel sure of it, would not be much more than a little town perched on a hill with rather a nice cathedral. Laon is a place which "grows on one." You begin by liking her, and end by passionately loving her. Whether her situation or her buildings make up the greater charm it would be idle to speculate. A city on a hill always has a peculiar charm, and in Laon this is intensified, since from each of the four sides the views are so essentially different. Possibly that from the spur of hill called St. Vincent is the most striking. This, with the spur on which the cathedral stands, together with that on which the bulk of the town is built, makes up a perfect horseshoe. The space thus enclosed is the "Cuve Saint Vincent," to which the woody sides of the hill descend rapidly. Between the ends of the horseshoe one catches a glimpse of plain, all blue and melting away into the sky. Of the old cathedral it may be said—

"There stands a structure of majestic frame."

From the highest arcades of the four towers can be seen the oxen carved big in stone, the beasts thus honoured for their share in the raising of this monument—the dragging up of the stones from the valley to the top of the hill.



Laon has been compared to Sienna, but the

THE CHÂTEAU DE PIERREFONDS FROM THE VILLAGE. DRAWN BY PATTEN WILSON.

comparison does not, I think, hold good. There is not the utterly old-world look here which Sienna, in common with most Italian towns, possesses. The town is encircled by the old fortress walls. Just outside, the pleasantest promenades imaginable, all overhung by trees, have been made.

But to explore the buildings. The most remarkable features of the cathedral are those four towers, two at the west end and two at the end of each of the transepts. They are exquisite. Some say that the cathedral was built in two years, 1191-1193. To quote from J. H. Parker, it was "considered by Viollet-le-Duc to be of the beginning of the thirteenth century, and the reasons he gives for assigning it to this date appear conclusive. The style is Early Gothic, but very heavy, and with considerable remains of the transitional character; the east end is square, which is very unusual in France, though common in England at that

S. MARTIN, LAON. DRAWN BY ERNEST T. MARRIOTT.

period. Rodulphus de Warnaville, or Venneville, who was Bishop of Laon from 1182-1193, had previously been Archdeacon and Treasurer of York and Chancellor of England. . . . Many of the country churches round Laon have also square east ends, after the English fashion; they are chiefly imitated from the cathedral church, though some of them would appear earlier. They are a very interesting set of churches of the twelfth and thirteenth centuries, several of which are well worthy of careful examination." The interior is very regular. The aisles are flanked by thirty-two side chapels, with finely-carved wooden Renaissance screens. A few yards from the cathedral is the octagonal chapel of the Templars, a very interesting early twelfth century building. The roof is formed of small plaquettes of hard stone, an example which is unique in France. Adjoining is a musée which is worth a visit. The picturesque Porte d'Ardon is one of the few remaining gateways of Laon. It was built in the thirteenth century on the site of a Roman gateway of which to-day one can see the substructure formed of immense stones put together without cement. The church of St. Martin is one of the most remarkable buildings of Laon. Viollet-le-Duc calls the façade of this church one of the best models of the end of the thirteenth century or of the beginning of the fourteenth century. This beautiful façade is a little marred by the ignoble "calottes" placed on the top of the flanking "tourettes."

These are a few of the many interesting buildings in Laon. Eleven days pass all too quickly for a thorough exploration of the city with her environs. The villages in the immediate neighbourhood — Bruyères-sous-Laon, Vorges, and Nouvion-le-Vieux—all possess churches of exceptional interest, and further afield are the celebrated pilgrim church of Notre-Dame-de-Liesse and the historic château of Marchais.

Truly Laon is delightful: a fitting place in which to conclude a holiday full of interest, full of pleasurable recollections.

The Statue of Admiral Blake executed by Mr. F. W. Pomeroy is to be unveiled at Bridgewater on October 4th by Lord Brassey.

The National Gallery has lately acquired the following works by gift, bequest, or purchase: Lady Layard has presented a fresco painting of the Madonna and Child, by Giovanni Bellini. Mr. G. F. Watts, R.A., has added two important works to those which he had already given to the Gallery—"The Triumph of Love" and "Time, Death and Judgment." A large body of subscribers to the Burne-Jones Memorial Fund have presented to the National Gallery the well-known and important work by Sir Edward Burne-Jones, "King Cophetua and the Beggar Maid." Mr. Henry Vaughan has bequeathed to the Gallery a life-sized statue of Flaxman by Weeks, and a similar statue of Sir Joshua Reynolds by Foley. By purchase, a picture by Fra Bartolommeo, representing the Virgin and Child, has been acquired.

PRINCIPLES OF GOOD ARCHITECTURE.*

BY JOHANNES OTZEN.

A VAST and powerful movement is gaining upon all domains of art, endeavouring to act either in a reformatory or in a revolutionary manner on each of them. The history of art shows many such periods, but though the events and the general conditions of these movements repeat themselves their appearance has always differed. As far as ancient nations are concerned, and as far as we know the incidents of those ancient times as regards revolutions in art, they always appear as a slowly progressing but irresistible change in the mode of thinking and feeling of the nation. The fundamental causes of these changes were probably always the same: the exhaustion of their own intellectual power and the invasion of superior elements of civilisation of another (frequently politically vanquished) people. No doubt in every movement of the kind certain powerful individualities have often been the centre, but they never appeared on the surface and their works became the property of the community from the very beginning. In proportion as the general development of civilisation progresses, the relations between these leading minds and the movement inspired by them appears to change.

Only in the period of the Renaissance and during the art periods developing out of it personalities appear as tyrannical individualities following with prodigious power and reckless energy their own paths, apparently forcing the nations to follow in their track. But only apparently, for in reality it was in the Middle Ages the intellectual currents of the nations that set boundaries to the doings of those heroical natures from which they took their force and their artistic power. If the preceding holds good for art in general, it does especially so for architecture. Architecture as an art was from the first called upon, by its nature, to exclude any absolute arbitrariness, and it is architecture with the inexorable logic of its ideas that shows most distinctly the picture of the development of human civilisation, and least of all the arbitrariness and the momentary influence of morbid impulses.

From the limited time granted to me I must forbear following the general art movement to exclusively investigate the influence on architecture exercised by the eclectic art-currents of the nineteenth century.

If in this respect the more than abundant and rather too exact (photographic) publications of historical monuments of all times; the considerable increase of scientists of architecture, without practical education in the craft, and hence desirous of writing books and of discovering things new; the general human craving for change of the exterior phenomena of life; the artistic speculation on this human weakness; the over-estimation of self, &c.; I say if in this respect the above are the unpleasant reasons of the modern movement of art there are quite as many that are estimable and justified. For every reflecting person with nobler intuitions there is something repulsive and mean in the superficiality of the style of the later decades of the nineteenth century. The more chaste our feelings the easier we shall be inclined to renounce all

* Summary of a paper read before the recent International Congress of Architects held at Paris. Professor Otzen is Senator of the Royal Academy of Arts at Berlin, and an honorary member of the Academy of Arts at Vienna and the R.I.B.A.

styles, instead of using them as it were merely as costumes, applying them only as something outward or external.

Modern life of our present times, in its completely changed forms and with its partly new materials, offers more problems to be solved, which cannot be got at with traditional patterns.

The dying away of the great eclectical movement of the nineteenth century into an insipid and senseless formalism of the types of style must be considered as a decline. As far as modern art tries to check and contest it, it is to be considered as a sound reaction.

Though structures as works of art are to develop from requirements they must be true to the task of any architectonic creation to idealise the real.

With every construction claiming to be a work of art each material it consists of must be treated and employed according to its particularity. Every architectural falsehood, every intended illusion must be rejected, and the ornament must be in accordance with the characteristic treatment of the material. The climate, the country, rural or urban vicinity, must be correspondingly taken into account.

The important question as to the proportion and the extent in using traditional types of art cannot be generally answered. No doubt by creatively treating a tradition there may be produced works quite as artistic as by abstaining from the frequent appliance of historical types and from a predominating propensity of adapting the style to the material.

If a modern architect is possessed of sufficient creative power to replace the great prototypes of tradition by better types of his own choice, or if he has sufficient confidence in his own talent to dare to do so, let him try, and such an honest architect does not deserve any reproach; the crudeness of feeling begins only when a modern artist ignores the eternal laws of architecture, and of the shaping of the different parts of a structure, simply because he wants to be modern and cannot be so otherwise.

The ornament is chiefly destined to point to the character and use of a building; mere arbitrariness in application or even a shaping of the ornament in contradiction to the use of a building is to be avoided.

The proportions of the architectural dismemberment and of the ornamental or figurative decoration must be in accordance with the general proportions of the building and must be uniform for one and the same construction.

We want to be freed from the dead formalism of the last decades; we want a brisk and unconstrained solution of the tasks of our modern times. However, we want to approach this task equipped with the knowledge of a tradition we fully comprehend instead of knowing it only by heart, not with the dynamite of anarchists, capable of destroying but incapable of creating a civilisation by petty self.

We men of the craft may perhaps understand and comprehend how talented architects endowed with a rich fancy have at the end of the nineteenth century been induced to tread the by-ways of boundless arbitrariness. Those who are not of the craft cannot: they see and stick to the visible formalism, confounding poverty with fortitude of mind; ignorance with greatness; impudence with doings of the superhuman; and admire the productions of miserable though excusable aberrations as immense creations of art. Most fatal is this period of the breaking down of old ideals and of the barrenness of the schools of special tendencies of style for the "studying youth."

Gentlemen and colleagues, in this memorable place and in the grave times we are living in I warn all those to whom their art is not only the maintainer but also the holy flame of their spiritual hearth to mind these truths, each in his proper place, be it as a teacher of a whole people by his words in stone or iron, be it as a teacher of students doing his best to cause the fermenting must of our days, the powerful but often savage struggle of our epoch of strongly developed personality, to produce a future of modern architecture the dawning of which we may live to see and rejoice at and in the progress of which we shall rise once more in the domains of the great technical family to the position that is due to us.

THE GREAT TOWER, PIERREFONDS. DRAWN BY PATTEN WILSON.

THE COST OF BUILDINGS.

BY JOHN T. REA, F.S.I.

THERE are five methods of ascertaining the value of buildings before erection. Four of these deal with approximate estimates, and are chiefly used by architects; the remaining one is the more exact method of precise quantities, and is the business of the quantity surveyor. These methods are:—

I. *Estimating by the cost per cubic foot of similar buildings.*—This is the best known and most usually adopted method, because of its general convenience. The dimensions are best taken by measuring the length and breadth from out to out of walls, and the height from half foundations to half-way up the roof. The cubic contents thus obtained are multiplied by the price per foot cube of some similar building. Sometimes the height is measured from the bottom of footings (i.e., top of concrete) to half-way up the roof. Cheaper attached structures, such as annexes, stables, sheds, &c., should be kept separate and priced at a lower rate; while more ornamental portions, like towers and porches, would be valued higher than the main block. Small buildings cost more in proportion than large ones of the same type.

This cubing system is open to some objections. The lumping together of voids and solids at one rate is certainly unscientific, for the same class of building may be divided into many rooms with numerous internal solids in the shape of walls, &c., between; while another may have comparatively few chambers, creating much empty space. In fact, the proportion of voids to the solid structure is not a fixed quantity, so that the price per cubic foot can never be exactly regulated. This requires large experience and a nicety in pricing which the estimator cannot always possess. The description and quality of materials and workmanship, too, are seldom the same; neither are the conditions of contract; and these variations are frequently overlooked when a certain rate per cube foot is assumed. Owing to these imperfections the following methods are better:—

II. *Taking out rough quantities and pricing the items*—This method is described in Leaning's "Quantity Surveying," and in "A Price-Book for Approximate Estimates," by T. E. Coleman, F.S.I., surveyor, Royal Engineer Establishment. The work should be concentrated into as few items as possible in order to save labour, and a schedule of prices or old bills of quantities would be necessary to price these out. Though less expeditious, this is a more reliable system than pricing at per cubic foot.

III. *Estimating per square.*—This method has been recommended by Professor Kerr in his "English Gentleman's House," and by Mr. Webber in his "Choice of a Dwelling," published in 1872. It has, however, been reserved for Mr. S. Alcock, F.S.I., surveyor, R.E. Establishment, to develop and fully describe this system in an article contributed to the "Occasional Papers of the Association of Surveyors of H.M. Service, July, 1894." The mode is to take the constructional shell only, pricing it at so much per 100 sq. ft. Walls, for instance, are taken according to their thickness and manner of finishing, including all digging, concrete, plastering, papering, &c.; floors including joists, struttings, ceilings, &c.; roofs including slating, lead work, rafters, boarding, &c.; and so on—all being reckoned at per square complete. Such a system of superficial measurement appears to be more satisfactory than the cubing, as it takes into account the materials and labour in a more exact and definite form. Of course a special list of prices must be compiled for each of these main superficies, and care and discrimination are certainly required.

IV. *Pricing per unit of accommodation.*—This is a somewhat rough and ready means of estimating the cost of such buildings as hospitals, schools, churches, stables, which may be respectively priced at per patient, per scholar, per sitting, and per horse. It is better, however, to check an approximate estimate by working out two or more styles, thereby ensuring closer results.

V. *Estimating by accurate quantities.*—For full information on this head the reader is referred to such well-known books as Leaning's "Quantity Surveying" and Fletcher's "Quantities." This method is only adopted when it is intended to actually carry out the work, and usually when tenders are sent in by several builders in competition. It is very laborious, and necessitates great skill and a thorough knowledge of building construction, so that the subject is invariably left to quantity surveyors as experts. The system is divided into the three parts of "taking off," "abstracting," and "billing," the last only being forwarded to the contractors for the purpose of inserting their prices, when the completed bills are sent to the architect for his and his client's decision. The whole procedure is, of course, familiar to every reader of this paper.

The following average rates are for brick buildings erected under ordinary conditions. Stone buildings would cost 10 to 20 per cent. more, according to the locality:—

Estimated Cost of Brick Buildings.

	Per ft. cube.	Per unit.
1. Asylums (lunatic), including administrative buildings	6½. to 7d.	£150 per inmate.
2. Barracks, officers' quarters	8d.	£400 per officer.
3. Barracks, married soldiers' quarters	7½d.	£250 per man.
4. Barracks, soldiers'	6d.	£35 per man.
5. Baths, best type, including machinery and appliances	1s. (Saxon Snell)	
6. Breweries	5d. to 7d.	£300–£500 p. qr.
7. Chapels, plain	5d.	£5 per sitting.
8. Churches, including tower	6d. to 8d.	£6–£12 per sitting.
9. Churches, iron, 400 to 700 sittings	—	£3 per sitting.
10. Cottages, labourers'	4½d.	£200 each.
11. Cowhouses, complete with fittings	3½d.	£17 per stall.
12. Factories, exclusive of machinery	6d.	
13. Gymnasiums	5d.	
14. Hospitals, general, including administrative buildings	8½.	£300–£500 p. bed.
15. Hospitals, general military	7d.	£300 per bed.
16. Hotels, first-class	1s. 4½.	
17. Hotels, second-class	1s.	
18. Houses or "Mansions," first-class, main building	10d. to 1s. 3d.	
19. Houses or "Mansions," second-class, main building	8d. to 10d.	
20. Houses or "Villas," third-class, main building	6d. to 8d.	
21. Houses or outbuildings and offices	6½. to 10½.	
22. Law Courts	10d.	
23. Libraries, public	8d.	
24. Maltings, complete	2½d.	
25. Museums, public	1s.	
26. Post-offices	8d.	
27. Prisons	9d.	£150 per cell.
28. Schools, ordinary	7d.	£6 per scholar.
29. Schools, London School Board	6d. to 8d.	£10 to £15 ditto.
30. Schools, technical	8d.	
31. Sheds, iron, roof and sides of corrugated iron	2½d.	
32. Sheds, wagon or cart	4d.	
33. Stables, first-class (including cavalry officers')	8½. to 10d.	£150 per stall.
34. Stables, second-class (including cavalry troop)	7d. to 8d.	£100 per stall.
35. Stables, third-class	5d. to 6d.	£50 per stall.
36. Theatres, first-class	1s. 3d.	£30 per head.
37. Town Halls	10d. to 1s. 6d.	
38. Warehouses, plain	5d. to 6d.	
39. Workhouses	5d. to 6d.	£50 per inmate.
40. Workshops, general artificers', complete	6½d.	

Cost of Buildings Erected.

The following list, showing the actual cost of buildings as erected, will be useful for the purposes of comparison:—

	Per ft. cube.	Per unit.
1. Bow Street Police Station	11d.	
2. British Museum (1843)	1s. 6d.	
3. Chorlton Union Hospital	—	£50 per inmate.
4. City Offices, Gracechurch Street, London (stone front, fireproof floors, stone staircase, hydraulic lift, faience passages, &c.)	1s. 1d.	
5. Flats, South Audley Street, London (stone and terra-cotta, fireproof floors, hardwood finishings, enriched plasterwork, &c.)	1s. 2d.	
6. Foreign Offices (1857)	1s. 0½d.	
7. Herbert Hospital, Woolwich, including administrative buildings	—	£320 per bed.
8. Holborn Town Hall	1s. 2d.	
9. Holborn Viaduct Hotel	1s. 4d.	
10. Hôtel Victoria, Northumberland Avenue, London	1s. 6d.	
11. Houses of Parliament (1843)	2s. 6½.	
12. Manchester Assize Courts	9½d.	
13. Netley Hospital, including administrative buildings	—	£305 per bed.
14. New Post-office, St. Martin's-le-Grand	8½d.	
15. Royal Exchange (1841)	11d.	
16. Schools, Hornsey, London (brick, wood-block floors, &c.)	7½d.	
17. St. Pancras Infirmary, Highgate	—	£69 per inmate.
18. St. Thomas's Hospital, London	9d.	£650 per bed.
19. St. Thomas's Hospital, London, one pavilion, without administrative buildings	—	£250 per bed.
20. Warehouses, Drapery, London (stone front, fireproof floors, &c.)	1s. 1d.	
21. Warehouses, Thames Street, London (brick, unplastered, wood floors)	7d.	
22. Waterlow's Industrial Dwellings	7½d.	
23. West London Workhouse, Holloway	—	£48 per inmate.

Work done in small quantities is worth more than that done in large quantities—usually 20 to 25 per cent. more. Two-thirds of the cost of a building are for workmanship and finishings; the remaining third is for carcase. The total cost of average quality buildings is four times the bricklayers' bill, while carpentry and joinery generally amount to one-fifth of the whole job. The speculating builder employs piecework, which means a minimum of labour everywhere.

The rent of a first-class town dwelling may be calculated at 5 to 6 per cent. on its cost of building.

Closely connected with the cost of a structure is the method adopted for its erection. The cheapest and best is a contract on quantities; next, a contract without quantities (on drawings and specification); then, measured work with a schedule of prices; and, least advisable, employment of workmen supervised by the building owner's clerk of works. For Government work, such as barracks and forts, where the executed quantity will often be uncertain or small, a schedule of prices is invariably made the basis of a contract, the job being measured on completion. The best of these is undoubtedly the War Department Schedule of Prices, which is revised triennially and contains a great deal more useful information than the almost worthless price books that are annually published. In France, where it is called "Bordereau de prix," the schedule of prices obtains somewhat more consideration.

Architects and builders are advised for their own information to keep a notebook, setting forth the cost of buildings designed or erected by them, and giving such particulars as time of erection, estimated cost, highest tender, lowest tender, and actual cost as finished. An office record of this sort is simply invaluable.

The Royal Palaces of Bangkok form a city in themselves. They consist of several hundred individual palaces, surrounded by magnificent gardens and pagodas. Bangkok is really a city of waters: it is an Indo-Chinese Venice, more people living in floating homes on the Menam, "the Nile of Siam," and on many canals, than in permanent buildings.

Dorking Municipal Buildings and Post-office Competition.—Mr. Tanner, the assessor, has selected the plans marked with the initials "Q. E. F." These have been submitted by Mr. W. Shearburn. The second set of plans, marked "S. P. E. S.," were sent in by Messrs. Bargman and Benison. The Dorking Urban Council have resolved—"That, in compliance with the resolution of the 24th May, Mr. W. Shearburn, the designer of the plans marked 'Q. E. F.,' be and is hereby appointed architect, subject to such modification of the plans suggested by Mr. Tanner, and recommended by the special committee, as may be finally adopted, and subject to the Council hereafter deciding to expend the sum required to erect such building, whether amended or not; that the special committee be empowered to confer with the architect in relation to the suggested modifications, and to communicate with the General Post Office."

SOME NOTES ON DRY ROT.—I.

By A SPECIALIST.

THERE is probably no subject connected with the building trade which is of such importance as dry rot, or rather the prevention of dry rot. It is also a subject on which much has been written in the trade journals, though a great deal of this matter is of little practical value, owing to the fact that the theoretical standpoint only has been taken.

In this first article I propose to deal with the *causes* of dry rot from an entirely practical point of view, my knowledge being the result of about ten years' experience, during which period I have made a special study of the subject and have profited as much by other persons' failures as by my own successes.

The primary cause of dry rot is, as everyone knows, want of ventilation, but there is considerable difference of opinion as to what constitutes proper ventilation, as my illustrated examples of cases I have cured will show. Again, some timber would be perfectly safe with a certain amount of air circulating round it, while other timber in the same situation would breed fungus in six months: for this reason the timber for ground floors (which are usually affected first) should be carefully selected. It goes without saying that yellow deal only should be used. It should be seasoned and moderately dry, no sap, and what should be especially avoided is dead wood, that is, timber cut from dead trees: this can easily be recognised by the dead knots, the peculiar appearance of the sap wood and the disagreeable feeling when it is sawn or worked in any way—it will not work clean, but pulls and drags, as it were, in front of the saw or chisel.

Some persons have the idea that pitch pine is free from the attacks of dry rot on account of its resinous nature. This is a great mistake. It is as liable to attack as any other kind of wood, which I shall prove in the next article.

Floors are often put in on a level with, or even lower than, the ground outside, thus often causing bad cases of dry rot where otherwise there would be nothing the matter. The omission of the damp course is also another fruitful cause of dry rot; so also is the fashion of covering floors completely with linoleum or oilcloth. One case in particular I remember. A new floor was put in, and, acting entirely in opposition to my advice, the boards were covered with linoleum, and the result was that in twelve months the floor was decayed and had to be renewed. A square only of linoleum was used the second time, the border being stained and varnished, and the floor was as good as new for years after, and probably is so to this day.

The causes of dry rot mentioned above have all been connected with the timber itself or the situations in which it has been used, but there is yet another very fertile cause of mischief; this is the soil on which the house is built. The safest is a dry sandy soil, as this does not give any encouragement to the fungus. A soil less to be desired is a damp clay, and the worst of all is the made ground—that is, where all kinds of refuse, from any and every place, have been tipped, perhaps for years. There are, of course, intermediate grades of all the above, each requiring more or less precautions before being built on. These precautions, then, will about exhaust the list of the most common causes of dry rot, which may for reference be stated as follows:—Primary cause, defective or entire absence of ventilation. Secondary causes, unsuitable timber; floors placed below the ground line; the omission entirely of the damp course, or the use of a faulty one; linoleum or oilcloth as floor covering; damp or otherwise unsuitable soil. Many other accelerating causes could be mentioned, but if the above are guarded against the minor ones will have little or no effect and may be left out of the reckoning.

In my next article I shall illustrate actual examples which I have dealt with, showing the manner in which they were effected, the probable cause and the method adopted for the cure, which in nearly every case was successful. In the unsuccessful cases I shall show what was, in my opinion, the cause of failure.

(*To be continued.*)

THE RESTORATION OF ANCIENT CHURCHES.*

By THOMAS ELLISTON.

SO much irreparable mischief has formerly been done to our churches under the guise of restoration that no apology is needed for an earnest endeavour to put clergymen and churchwardens on their guard in this matter. In so doing I have no intention of making libellous statements or insinuations, but am content to let bygones be bygones and simply counsel precautions for the future.

Doubtless church restoration is usually entered into on the part of the clergy and churchwardens with the very best of intentions, and with much honesty of purpose. But honesty of purpose is one thing and a practical knowledge of the principles of church restoration is another. Generally speaking, as little new work as possible should be introduced,

True Restoration

consisting of repairing and renewing only those portions which are decayed or unsafe; faithfully copying the better preserved portions of the original work. It very rarely indeed happens that all traces of the original mouldings, stringings, tracery, &c., have disappeared, but, if they have, copies can be obtained from a church of similar style elsewhere, and the nearer such a one can be found the better. It is a great mistake to design new work for old churches (unless extreme care is taken), for, even if the style is correct for the period, you may find out too late that the elaborate tracery of a new window in your plain church painfully attracts the attention, to the equally painful detraction of the original work. Such a window—however good it may be in itself—looks, as it is indeed, entirely out of place.

Anything new which is likely to absorb attention to the detraction or exclusion of other portions must be utterly condemned. It will not blend. What is required is honest restoration, not alteration. Beware of going in for what is termed a "general restoration," that is, handing over the venerable structure to either architect, builder or contractor, and letting him do the lot in one job; resulting in a spick and span, brand new, cheap and nasty modern revolution in tiled work, bricklayer's pointing, flimsy joinery, &c., with all the latest improvements—utterly unrecognisable as part and parcel of the grand old church. Better, by far, to personally superintend the village carpenter and mason in simply copying and repairing.

Practical Hints.

Attend to one thing at a time and devote your constant personal supervision to the work; do it thoroughly well, employing good individual artisans to individual trades, and use only the very best of materials.

Don't be in a hurry; and if you have to build up new work against old work do it a little bit at a time, and rest it to set and settle, or build it in cement and well-washed road sand in equal parts. Remember that cement swells in setting, and is therefore better for underpinning walls, &c., than mortar, which shrinks in setting. But good mortar is not to be despised for ordinary use. New masonry and rubble work cannot be done too slowly, nor grouted too frequently whilst the work is in progress. The surface of the old work should be well hand-picked and roughed to a new face to form a clean key and thoroughly well wetted to secure adhesion. Eschew all such iniquities as iron corrosive ties to masonry, especially secret ones; and let everything you do be honest and fair and above board. Do not, on any account, attempt concealment or, worse still, deception; let everything show and be left to look what it is and the result will be satisfactory. I remember a case in point which will well illustrate my meaning. A builder once suggested painting a piece of lead flashing to match the colour of the tiles on the roof. The architect replied, "Oh, no!" Anyone who understands the work will know that the flashing is necessary, and will expect to find lead there.

Competition contract is fatal to good work and stands self-condemned, as it is only to be expected that the acceptance of the lowest tender risks the satisfactory completion of the work, there being great scope and temptation in such material as concrete and in hidden work to save expense to the contractor. The labourer is worthy of his hire; therefore, do not tempt honesty to stumble by a dishonest attempt to obtain the best of the bargain.

The Fads of Architects.

Architects sometimes have fads: one rejoices in tracery, another introduces ironwork, another goes in for a particular kind of stone (instead, perhaps, of using the local material of which the church is built), and so on, and do not consider that the work is satisfactory until one or other has been introduced. This feeling must, if necessary, be sunk in favour of true restoration. Never attempt the impossible task of improving upon the original, nor humiliate the dignity of humble work by endeavouring to make it tell a lie.

English oak is the standard wood for our church work, but foreign is much used, being milder and easier to work. Chestnut was formerly frequently used, but it fails and decays at the knots. Quarry stone should be of similar kind to the original if that is suitable and procurable.

The most important matter in a church is the state of the foundations of the walls, piers, and columns. Years ago graves and vaults used to be dug inside as well as outside, sometimes quite close to the walls. In such a case it is necessary to underpin the walls—in short lengths at a time—and to carry the foundations down in good cement-concrete to a solid bottom below the depth of the graves or vaults. Also to lay the surface of the ground outside the walls to a fair fall outwards, providing suitable lead (not cast iron) rainwater down pipes and drainage to a distance. If possible, lay the highest part of the fall (next the walls) well below the floor line and provide ventilation beneath any hollow floors.

After the foundations have been seen to, look well round the walls, from a constructive point of view, and see if you can detect any weakness or want of stability. The line of columns and main piers should run from the foundations to the principals of the roof without a break in order to carry the weight straight down; and only intermediate weight should be borne by the arches, which, in their turn, should be well secured against thrust at the springing points by massive masonry, rubble work, or buttresses. Sometimes arches have been thoughtlessly formed by cutting through solid work at a vital point, involving great insecurity to the building. Well examine the buttresses and see if they are properly bonded by the quoins. The set-offs and weatherings of buttresses frequently give out and should be set right by good large bonding stones beneath the stringing.

These remarks will also apply to the tower, and if there exists any excrescence in the shape of a Georgian spire use your influence to have it taken off.

The General Appearance of the Building

should be one of massiveness in preference to lightness of construction. Many old churches are built considerably out of truth as to orientation, plan and elevation. Do not attempt to conceal such apparent errors, as they were probably intentional. The orientation of a church is determined by pointing to the rising of the sun on the morning of the day of its patron saint, which, varying considerably according to the time of the year, accounts for apparent error, and in many churches the chancel is symbolically deflected.

Do not try to point up flint or rubble work with the trowel—bricklayer fashion—but after filling up the joints flush with the flints finish by drawing round the flints a short wooden lath. Well wet all old rubble work and masonry in adding new work or pointing, or the new work will not adhere. It is a good plan (especially if the funds are low) to leave stone carving of corbels, &c., to be finished *in situ* later on. Any plastering should be rendered in gauged

* "Church Times."

stuff, and be floated, not trowelled, well wetting the walls as before mentioned.

In even rude flint or rubble work courses should be maintained, and new work should as far as possible be carried up *en masse*, and not be left down in places for future completion of the mass of stonework. In very thick work it was a common practice to carry up the outer faces of the flintwork a certain distance and shoot in the middle portion; but this is inadvisable, as the process of shooting is apt to bulge the outer faces, for, in order to secure adhesion, it must be done whilst the faces are yet in a green state; if they are allowed to set before shooting in, there is no proper amalgamation or cohesion; likewise, good bonding of such work is impossible.

All quarry stonework must be laid on its proper bed, and care must be taken to provide suitable kinds of stone to stand weather and weight.

The Roofs

next claim attention. Look at these first from a constructive point of view, as in the cases before mentioned, ascertain if they are the original or bastard ones, and act accordingly. In the matter of lead gutters it is not sufficient that good laps and falls should be given, but insist also upon having good, deep drips, or the gutters will fill with frozen snow, and when it begins to melt the water will run back over the laps and get in. Have plenty of outlets of good dimensions; and do not let the plumber lay the roof leads in sheets of too large a size, or the expansion and contraction will cause the lead to crack. Provide that the water does not discharge or splash on other roofs, but carry it down as before mentioned. Have good flashings where required and get rid of the roof water in the shortest available distance, as long falls are usually slight falls, and are undesirable for many reasons. It is not sufficient to simply provide a fair water-way, but a good margin must be allowed for blockage. Avoid square elbows in down pipes, awkward turns in gutter work and lodgments for snow. Let common sense dictate. The upper edges of flashings and gutters should be properly protected against the possibility of becoming loose, either by stepping into the walls or by being covered by a narrower supplementary flashing built or let into the wall and folded over.

The tracery and lights of old windows are seldom exactly true; therefore in ordering new lead lights it is best to cut a paper pattern or template to fit in full size, marking the inside and outside, and the order and number of the lights. Send also a rough sketch of the window—the maker to allow for the grooves in the stonework.

Internal Woodwork.

The seats and fittings of a church should be of a substantial and suitable character, and the former should not, as is too often the case, be made up of joiner's work and finished with a length of moulding stuck on the top and elbow. It is a pity that poppy-head bench ends do not receive more attention.

Intersections of mouldings in church woodwork should never be mitred, but may be scribed, or, in restoring old work, the joints should be of the square and butt kind and the moulding worked on the solid endwise of the grain to complete the intersection.

Doors should be hung with long smith-wrought clasp eyes and hooks and not with butt joints and sham clasps of cast iron screwed on, which are worse than useless. The doors should be well braced to prevent drooping and all outer upper edges of rails should be well bevelled to shoot rain. Remains of old carvings or screen work should be carefully preserved and restored (renewing only defective portions), even if the cost is greater than that of the entire new work. Every detail of fittings and new work must be carefully considered as to proportion and style. Provide ventilation in lead lights and see that a small channel communicating by pin holes with the external window sills is made at the bottom of each light, to allow condensed water to escape without streaming down the inside sills and walls.

Do not disfigure the church by tiers of hot-water pipes and see that lamps or gas-fittings are fixed so as not to do injury by heat, nor must mouldings or ornaments be cut away by them.

Ancient internal tombs, monuments and brasses should be carefully preserved from injury by railing them in, whilst for the more modern floor slabs—if liable to defacement by traffic—permission should be sought to enable them to be removed and placed elsewhere—on the walls, or, if too large, the inscriptions to be copied on a tablet. Internal vaults should be examined and dealt with to render them safe, and if possible the contents should be removed or embedded in solid concrete.

Bells

exercise so great a strain on a tower as to call for serious consideration. The lower they are placed the better for the tower as long as they are not steeple-bound. They should be made to swing in counteracting positions to each other and the walls should not be cut away for the bells to swing, nor should the upper part of the bell-frame touch or be wedged against the walls. Illuminated clock faces require large weakening holes to be cut through the walls, which are apt to endanger the safety of the tower, in which case they should not be allowed to be made.

A great difficulty in old churches is where to put the organ. On no account put it into an organ chamber, which, besides entailing great expense, ruins the tone of the instrument; see also that the case is in keeping with the character of the building and not of the nature of a huge cupboard—a miracle of ugliness—which impairs and retards the tone of the instrument. The less case the better.

If at any time a defect or settlement should appear, attend to it without delay; and keep your eye on the gutters, down pipes and discharge of water.

It is hoped that these few hints may help the reader to avoid some of the greater pitfalls of modern church restoration and enable him to assist in the preservation of what is left of the good old work by arresting the hand of the destroyer and mutilator, so that our churches may be handed down to posterity as creditably as it is possible now to do.

OLDHAM CORPORATION WATERWORKS.

THE NEW RESERVOIR AT ROODEN.

THE recently-completed Rooden reservoir and works have been constructed under the powers obtained by the "Oldham Corporation Act, 1886."

The first sod was cut on July 30th, 1894. The reservoir has a top water area of 21 acres, is at an elevation of 1,068ft. above ordnance datum, and has a capacity of 265,000,000gal. The natural gathering ground of the reservoir is only 25 acres, which is augmented by collecting the flood waters from 370 acres in the Denshaw Valley and 423 acres in the Piethorn Valley, making a total gathering ground of 818 acres.

The north embankment is 578ft. long, with a maximum width of 484ft. and a maximum height of 83ft., and contains 179,500 cub. yds. of banking material. Its top width is 17ft, the inclination of the outer slope, which is soiled, being 2½ to 1, and that of the inner slope, which is pitched and shingled, being 3 to 1. The puddle trench for this embankment is 12ft. wide and 676ft. long, and has been sunk a maximum depth of 114ft. below the natural surface of the ground. The puddle wall above has a maximum height of 84ft., is 8ft. wide at the top, and batters 1 in 12 on each side.

The valve shaft, which is reached from the embankment by a girder bridge of 28ft. span, is constructed of masonry and cement-concrete and is lined with white glazed bricks; it is 89ft. 9in. high, being 7ft. 6in. square to a height of 10ft. 6in. from the bottom and 7ft. 6in. in diameter from that height to the top. It is surmounted by an octagonal masonry valve-house. The discharge tunnel from the reservoir to the valve shaft is built in cement-concrete 18in. thick, the internal dimensions being 3ft. 6in. wide by 3ft. 6in. high. The tunnel under the outer slope of the embankment is composed of cast-iron pipes 42in. in diameter, and discharges into a well at the foot of this embankment, where it is joined by the overflow channel.

The south embankment is 1,518ft. long, with a maximum width of 365ft. and a maximum height of 69ft., and contains 200,804 cub. yds. of banking material. Its width, inclination of slopes, and the materials of which it is composed, are similar to those described for the north embankment. The puddle trench is 1,550ft. long, and has been sunk to a maximum depth of 76ft. below the natural surface of the ground. The reservoir is supplied with water from the Denshaw Valley by means of a tunnel, and the supply from the Piethorn Valley commences in the Ashworth Clough, where the stream is diverted by means of a masonry and cement-concrete weir into a tunnel connecting it with Griffiths Clough.

The tunnel conveying the waters from the Denshaw Valley to the Hanging Lees reservoir passes under the Rooden reservoir at a depth of 130ft., and a ventilating shaft from this tunnel, 8ft. 6in. in diameter, rises into the reservoir. The interior of the reservoir has been lined to a height of 2ft. 6in. above and 15ft. below the top water level. The stone used has been procured from quarries belonging to the Corporation near the sites of the works.

The whole of the works have been designed by Mr. G. H. Hill, M.I.C.E., of Manchester and London, the resident engineers being Mr. W. Watts, M.I.M.E., F.G.S (at present the engineer for the Langsett works of the Sheffield Corporation), during the first portion, and Mr. C. J. Batley, A.M.I.C.E. (the present waterworks manager), during the latter portion. The cast-iron pipes have been supplied by the Staveley Coal and Iron Company; the valves, capstans, and other apparatus by Messrs. J. Blakeborough and Sons, of Brighouse.

A.A. SUMMER VISITS.

MEREWORTH HOUSE, NEAR WATERINGBURY, KENT.

ON Saturday last the fifth summer visit of the Architectural Association took place to the Earl of Falmouth's mansion, Mereworth House, near Wateringbury, Kent.

This celebrated mansion and estate are extremely interesting, not only in an historical sense, but from the architectural and the archæological standpoint. The house is a very fine specimen of Renaissance design of the early eighteenth century, and fitly succeeds the illustrious castle erected in the twelfth century by the celebrated Robert de Mereworth: of this building nothing apparently exists above ground at the present time, though its foundations appear to be very extensive, and in some places their positions can be traced by the configuration of the surface of the land, distinctly suggesting buried ruins. The castle was entirely demolished about 1730 by John Mildmay Fane, eighth Earl of Westmoreland, who employed the fashionable architect of the day, Colin Campbell, to adapt the designs and plans of Palladio's villa at Vicenza for the purposes of the new mansion. This scheme was completely carried out, except that a larger dome was substituted for the shallow one in the Italian original. The dome at Mereworth is a very ingenious construction, and consists of an outer and an inner shell, between which are carried up all the flues of the house. There is a section of it shown by Mr. Blomfield in his very admirable book on the Renaissance, and a complete set of drawings, or nearly so, are in Vitruvius. In its planning the building is a complete square, with a portico in the Ionic style on each face, built of stone that has weathered to the beauty of old marble: the Ionic capitals to the pillars, five in number to each portico, are of beautiful design and workmanship. Grand flights of steps lead from the porticos to the ground floor, which is built upon a raised basement. The building is surmounted by an extremely awkward, if not clumsily designed, roof, giving

to the whole an unstudied and unfinished appearance. The principal front remains to-day as it was originally built, with the mansion in the centre flanked by two large buildings, used respectively as the stables and a park house. This aspect possesses a very dignified appearance, one that is much enhanced by two immense masses of yew trees—one on either side—that give great scale and beauty of colour to the house. The principal entrance leading from the portico on this side opens into a comparatively small vestibule richly decorated with fine detail and figure sculpture, together with a panelled and coffered ceiling. From this vestibule direct entrance is obtained to the great central hall, an immense circular apartment of a great height, with a gallery, the whole surmounted by a beautifully designed coffered dome, in which are four circular lunettes lighting the hall, admirably decorated with floriated plaster work, the whole being distempered pure white; above the gallery are finely designed doors giving access to various apartments and the staircase. Below, on the four sides, are the large arches that once led to the various vestibules, two of which have been abolished. The tile floor was not only out of place amongst the fine architectural embellishment, but seemed in contrast almost execrable. From this place, reaching the entire length of the garden front, and opening upon another portico, is the great drawing-room or saloon, 100ft. by 30ft. by 25ft. The room is hung with very handsome old light-russet velvet, with two finely designed white marble fireplaces of large size, surmounted by elaborately carved painted and gilded overmantels. The great doorway, richly painted and gilded, is supposed to be a later insertion by Colin Campbell: it certainly does not seem to be coeval with the remainder. Above the velvet hanging of the walls is a fine frieze and cornice, highly gilded and richly ornamented, supporting a very deep and elaborately painted coved ceiling. The walls are hung with large and finely coloured ancient family portraits in large black and gold frames, and the whole room is furnished handsomely. Opening from it on one side is the tapestry room, one again possessing a finely panelled, painted and gilded ceiling, the walls being hung with tapestry representing pastoral scenes in the style of the French painters of the eighteenth century, like Watteau. The angle fireplace is very gorgeous, and possesses some remarkable detail. The dining room, leading from this room and opening into the principal vestibule, is very similar: it is hung with tapestry and painted. The interesting planning by which the square rooms are worked into complete conjunction with the circular hall in the centre of the building is very noteworthy. Crossing the vestibule we see the large dining room, now used as a library. It apparently was never decorated. The white marble fireplace here is of a very unusual design and detail. Returning to the circular hall, the staircase to the first floor is perhaps one of the most meagre and poorly designed one could inspect. It is so steep, narrow, and in places so dark as to be almost dangerous. It was formed by erecting a circular stair in a space left between the junction of the straight walls and the circular wall of the hall. The bedrooms are of great size, and possess the usual large bed recess or alcove, architecturally treated by having an elegantly designed plaster vault for a ceiling. The fireplaces in these rooms are excellent; many of them were discovered to be built up and have been reopened and renovated with great taste—in fact, the design of the whole house is so full of the finest architectural design, with such excellent suggestion in its planning for the treatment of a modern country mansion, that it is a matter of regret that time did not permit a more detailed examination. The basement is entirely vaulted in a very severe and characteristic manner. After we had inspected this portion, we saw the pavilions and returned to London.

H. D. W.

The Bust of Lord Brampton presented to the City of London Corporation by Lady Brampton has been temporarily placed in the Guildhall Art Gallery, pending its eventual removal to the new Sessions House.

Correspondence.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.W.

SIR,—The opinions generally expressed by your correspondents on this subject seem fairly unanimous in favour of improving the salary and status of the architect's assistant. I quite agree with "Junius," "Reform," "Advance," and others who seem in earnest in this matter; but the gentleman who signs himself "Ambitious" seems to hold strange views for benefiting his less fortunate brethren. He cites cases of assistants of three years' experience who are earning between £2 and £2 15s. per week. Now, in reply, I will undertake to cite fifty or a hundred cases to his one in which fairly capable assistants of that experience are not receiving anything like such salaries. "Ambitious" may be an employer himself: if so, let us hope that he carries out the principle; but if he is an assistant, well, I cannot congratulate him. He says: "In my experience the profession is comparatively just in regard to remuneration." Now, one would really like to know how far his experience extends. Has he travelled much, or has he been located in one office where assistants are fairly treated? Then, again, he says: "Men are paid for what they can do, not as workmen at a standard wage, irrespective of their degree of intelligence"!

I would ask "Ambitious" if we are not all workmen in a sense. But I have yet to learn that *workmen* receive a standard wage irrespective of their degree of intelligence. And this he says is conducive to a healthy competition which to a great extent would be wanting if all received the same salaries immediately articles were completed! But I would ask "Ambitious" who suggested such folly? What sane man would ever propose such a state of things? What we do contend is that architects' assistants are receiving a "wretched pittance," and that every junior who has diligently completed his articles and has a fair knowledge of the profession should receive a salary of not less than 30s. a week. If he is not qualified depend upon it his employer will seek the services of others. On the other hand, if he were a prodigy such as "Ambitious" cites, he would naturally be qualified for the higher standard and receive better remuneration accordingly.

So long as assistants are content to jog along their employers as a body will keep the same pace; but there are occasions when the spur is absolutely necessary, and I maintain that the only solution is by steady combination and an association formed by assistants themselves to further their own interests. By so doing they will be promoting a far healthier competition than that suggested by "Ambitious." Every pupil and every assistant would thus have an inducement to do his best in order to bring himself to the standard required, knowing that he would receive at least a fair and honest salary in return for his labour and study.

In conclusion, I think that every architect's assistant in the Kingdom should support the BUILDERS' JOURNAL, if only in return for facilities given to air this real and patent grievance.—Yours truly,

VIGILANS.

Piece Work and Housing.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—On page 33 of your issue for last week the above title has been given to an evergreen and vexed question, namely, "How many bricks can a bricklayer lay per day, and does he now do so much work as in past years?"

To a practical man this question is indefinite, only worthy of this answer—that it depends upon the man who is watching him. A fair average would be between 20 and 2,300. In no other trade does the amount of work done vary so much. A man can work hard and not lay more than the number first stated, while on another class of work he can set 1,200 bricks a day with ease: therefore in future it will be well for correspondents to state exactly under what circumstances their men work. Looking at buildings which were erected years ago, it is evident that artistic designs were the exception rather than the rule, therefore it is ridiculous to compare modern intricate work with that which could be done with a line, trowel and plumb-rule only; besides, of late years clerks of works have been engaged, and when they do their duty work is not scamped. It is impossible to lay more than 500 to 600 bricks a day on a wall 18in. thick which has no plumbing places and can be worked entirely with a line.

It is amusing to hear builders say what they used to do. Our Yankee friends say 3,500 bricks are laid per day in New York, but, strange to say, when in this country they fail to do so much. The old proverb, "Give a dog a bad name and hang him," is true in respect to bricklayers. Unfortunately, some characters will not stand examination; but does the public ever seek to find the cause of the trouble? It is simply this—the trade is entirely a dry weather occupation: should rain fall the men stand about idle, and they often visit a public house; after having a few glasses of beer they do not feel fit for more work, and as this occurs frequently it has a slow but certain evil effect.

A common fallacy is that we receive large wages. I have been fully employed by London builders, but can only say that though for the past four years I have worked every available hour, after deducting loss through stress of weather, unavoidable holidays, short winter time, and frost, my weekly average earnings have been only 33s. per week, out of which 2½ per cent. goes to a trade society. Considering the cost of living in London, no reasonable person will think this too much.—Yours tru'y,

AN HONEST BRICKLAYER.

Sloping Pavements.

To the Editor of the BUILDERS' JOURNAL.

ASHSTEAD.

SIR,—I note on p. 39 of last week's issue an abridged specification for a sloping footway—patent No. 17,794 of 1899. I may state from personal observation that brick pavements have been in use for many years at Brighton, constructed on the principle named by the patentee. I would instance the footway in Trafalgar Street, within one minute of the railway station: it is situated on a very steep grade and in its position seems very suitable.—Yours truly,

C. D. COLLINS.

The Architectural Association.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, W.

SIR,—Allow me to lay the following facts before you, hoping that, in the interests of the art of architecture, you will kindly bring them before the notice of your readers, some of whom may not be aware of the great advantages the Architectural Association offers, or may not, for various reasons, have yet seen their way to join its membership.

The aim of the Association is *to help students to fit themselves for their work as architects* by providing courses of instruction by which they may supplement the training acquired in the offices where they are engaged as pupils or assistants. These courses are wholly arranged and supervised by architects who know by experience what the training of an architect should be. While arranging a curriculum giving a broad and general training, embracing as it does the various branches of knowledge essential to architects, the Association's highest aim is to inspire its students with an enthusiastic love of the art side of architecture.

The membership consists of gentlemen who are training to be bona-fide architects, in addition to a large number of architects in practice: the students naturally form friendships among their own class, which are very stimulating to them during their pupilage and invaluable in their subsequent career.

The Architectural Association is the largest and oldest purely architectural school in the United Kingdom, and its staff of instructors is a highly qualified one.

The courses of study prepare for the examinations of the Royal Institute of British Architects. Courses are also arranged for those not

entering for these examinations. The School of Design and Handicraft is visited by specially chosen and eminent architects, who set the subjects for the designs and attend the class to criticise each student's work.

Further information can be obtained from the printed curriculum for session 1900-1901, just issued, a copy of which can be obtained by applying to the secretary at 56 Great Marlborough Street, London, W.

W. HOWARD SETH-SMITH,
President.

DEFECTS OF GLAZES.

TO one who knows the almost endless number of defects to which glazes are heir, the exhibits which museums afford of various specimens of what was accomplished in centuries past, and of brick and earthenware which are claimed to have been made a few thousand years ago, cause wonder and admiration. To those who have produced an occasional freak specimen the explanation of certain phenomena attending the glaze resulting from the treatment to which the particular ware has been subjected frequently proves a very perplexing problem, and often requires much arduous labour to probe to the bottom of the real cause. No one more fully appreciates the troubles which the question of glazes involves than do those who almost daily are confronted by new problems due to a change of conditions in some part of the manipulation, or a change of materials varying in composition to those previously used, either in the glaze or enamel, or perhaps due to a difference in the composition of the body owing to a change of some of the ingredients.

To enumerate in general the defects to which glazes are subject is not a difficult matter, for, generally speaking, we think of glazes as defective mainly in regard to crazing and shivering—purely a matter of difference of coefficient of expansion between the body and glaze, which, in most cases, with suitable and properly-fired biscuit, is capable of adjustment by attaining the proper acidity of the glaze. If the body and glaze tend to expand and contract at an unequal rate for each degree of rise and fall of temperature a rupture is bound to ensue, provided these conditions are carried far enough, and either shivering or crazing will be produced, according to which has the greater coefficient of expansion.

The simplest kind of glaze is, perhaps, the salt glaze, which is the only one used by sewer-pipe manufacturers, and very largely used by the stoneware potter. The manner of glazing consists mainly of throwing salt on the fires just previous to finishing a kiln, which results in a chemical decomposition, the elements composing the salt—sodium and chlorine—breaking up in the heat, the sodium uniting with the silica of the clay as it is carried into the kiln proper by the gases and comes in direct contact with the ware in its passage through the kiln, forming silicate of soda, which constitutes a glaze of the simplest type. If the salting is carried on properly the defects which the ware would be likely to show could be traced mainly to the body. No attempt to outline the kind of clay best suited for the manufacture of this kind of ware is here considered, more than it has to do with the glaze. In the manufacture of ware of this kind the clay must have certain requisites to make it most suitable to taking a glaze well. The proportion of the silica to the alumina must lie within certain limits to obtain the most satisfactory results, and should be such that the body will take a clear salt glaze. When deduced to a formula the typical stoneware clay is about as follows:—

$$\left.\begin{matrix}.56\ \text{Alkalies}\\ .44\text{CaO}\end{matrix}\right\} .525Al_2O_3 \left.\begin{matrix}\\ .150Fe_2O_3\end{matrix}\right\} 25SiO_2$$

The formula below is given by Seger as the most fusible porcelain mixture, and is taken as the basis on which the Seger cone series are founded:—

$$\left.\begin{matrix}.3K_2O\\ .7CaO\end{matrix}\right\} .5Al_2O_3 4SiO_2$$

The best salt glaze has about the following formula, which, by comparison, we find corresponds very nearly to the one above:—

$$1Na_2O\ .5Al_2O_3\ 4SiO_2$$

That is, the most satisfactory results are obtained if the proportion of alumina to silica is in the ratio of 1 to 8. Where there is not enough free silica, and the composition of the clay varies too greatly from the proportions named and does not take a salt glaze well, we find on trials drawn immediately after the salting process a glaze which meets approval, though only fairly well, but still looks promising; but once the kiln is cooled and the ware drawn we discover that, instead of bright glazed pieces, dull looking ones confront us, with scarcely a trace of what might be called even a semi-glaze. This is due to no fault of the burner. We must look to the clay for the trouble. Clays high in iron pyrites, and more particularly in sulphate of lime, most often prove troublesome, and from the presence of the nodules of calcium sulphate may be traced certain other defects. Where these nodules, though reduced in size by the dry pan, come to the surface they fail to take the glaze well, and defects appear on the surface about these spots in consequence.

With the white-ware potter or a potter using a standard body and in many cases a standard transparent, colourless glaze, where the question of colour decoration does not come into effect, the troubles which arise from defects attributed to the glaze are comparatively few. This is equally true, and applies more emphatically, to the red-ware manufacturer or to the manufacturer of roofing tiles, where the greater percentage of the glaze consists of lead in one form or another.

With the manufacturer of mantel tiles and the under-glaze decorative art potter, whose object is chiefly to impart great brilliancy and richness to the glaze and to bring out bright, rich colour effects, the troubles which are encountered are of a different nature. Here we have a properly prepared body which has been lawned through a fine mesh and freed of all objectionable matter. The defects commonly encountered are shivering, crazing and bubbling, and difficulties arising from the use of too fluid a glaze, causing flowing of colours and other irregularities.

With the manufacture of enamelled bricks which are burned in an open kiln we meet attending obstacles which are not encountered in making a pottery article, which we place in a sagger and carefully lute to exclude the kiln gases and draughts. Here with certain glazes we have the defect of "crawling," as commonly termed, as well as many others. But space will not permit an attempt to discuss these defects in detail and point out their causes and remedies.

In the handling and glazing of bath tubs and of variously sized and shaped pieces weighing several hundred pounds, where the glaze is applied to the green body and the finished product undergoes but a single firing, many difficulties arise, as might be imagined, which are not encountered in the manufacture of a teacup and saucer or a small vase. And so mention might be made of the various industries using glazes, and, after having given a rough *résumé* of the defects incident to each individual branch of ceramic manufacture, it really would convey but little to any but to him who has been in the harness and wrestled with these problems and their remedies.

Improvements at Chilcompton Church.—Last week various improvements to the interior of the parish church of St. John, Chilcompton, were dedicated. About three years ago a new chancel was added to the church, and since then the remainder of the scheme has been carried out. The work has been done under the superintendence of Mr. F. Bligh Bond, architect, of Bristol, the builder being Mr. John Sperring, of Midsomer Norton. The work in question consists of the entire reseating of the church, the removal of the gallery from the tower, a new west window added and the font removed to the tower. The whole work has involved an outlay of about £1,600.

Surveying and Sanitary Notes.

Breachfield Drainage Scheme.—The tender (amounting to £1,891) of Mr. Henry Ash, of Devizes, has been accepted for carrying out this scheme.

Messrs. Robert Boyle and Son, Ltd., the well-known ventilating engineers, inform us that the "Boyle" system of ventilation (natural) and Boyle's patent air-pump ventilators have been awarded two gold medals and one silver medal at the Paris Exhibition.

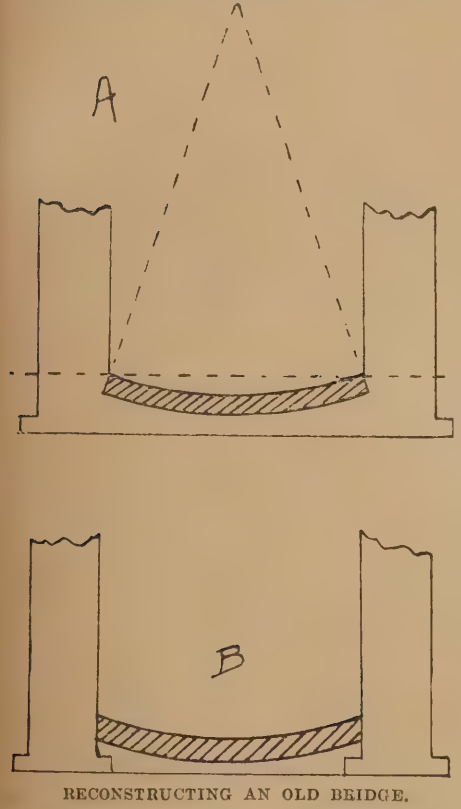
Institute of Sanitary Engineers.—At a meeting of the Election Committee held on August 15th the following gentlemen were elected:—As members: G. W. Allen (London); H. W. Gladwell (Walton-on-Naze); J. New (Italy); and T. S. Venkateswariah (Madras). As associates: R. Blythe (Durham); M. J. H. Lawrence (Pontypridd); W. G. Truscott (Southend-on-Sea); and H. Willard (Tunbridge Wells).

Improvements at Dublin.—A Local Government Board enquiry was held at Dublin last week into the application of the Corporation to borrow £6,800 for the purchase of a site for and the erection of a new morgue; £300 for the acquisition of property in Blessington Court; £950 for the construction of an underground public convenience in James's Street; £780 for the construction of an underground convenience in New Street; and £2,206 supplementary loan in connection with various improvement works.

R.H.S. Gardens at Chiswick: Some Proposals.—The Royal Horticultural Society have appointed a sub-committee to visit and inspect various sites that have been suggested or offered for their new gardens in place of Chiswick. It is probable that at no very distant date a selection will be made, and the old garden will be surrendered to the ground owner, the Duke of Devonshire. What will become of it is, of course, at present undecided. The builders have got their eyes on it, and it is said that an important London club propose to acquire it as the site for a new club building. The Chiswick local authorities have also set their hearts upon it for an open space for the public. It is true that Turnham Green and Kew Gardens are not far distant. But the Green is not much of a public pleasure ground and Kew is not a playground.

The Historic Bells of East Bergholt, Suffolk, are in need of repair. The vicar wants £100 to put the bells of the village church right. The fine tenor bell is cracked, the clapper having in the course of three centuries beaten its way almost through the metal. It is one of five, which are the only rolling bells in existence. The ringers swing them by handling the headstock. The bell cage in which they are hung is also unique. Moss-grown and quaintly latticed in oak, tradition says it was far back in the fifteenth century first erected in another corner of the churchyard, but the squire was so annoyed at the sound of the chimes that he had the curious building removed, so that the intervening church might deaden the sound.

Workmen's Dwellings at Tunbridge Wells.—At Tunbridge Wells the need of small dwellings for artisans, mechanics and the working classes generally has become very pronounced, and in consequence of their inability to secure houses in the town hundreds of workmen have been compelled to take up residence in the surrounding hamlets. For nearly five years the Corporation has been endeavouring to formulate a scheme for the erection of municipal dwellings, but has been obliged to abandon operations on account of the great cost of land, materials and labour in the district. Objection has been taken to any scheme which will involve a charge upon the rates, and as the Corporation has failed to arrange for the erection of dwellings which will pay their way it has been decided to appeal to the Local Government Board in the matter.



Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Reconstructing an Old Bridge.

Clevedon.—H. T. writes: "At a recent meeting of the Local Urban District Council the subject of reconstructing an old and very dilapidated bridge over a tidal stream was discussed. The local surveyor had very properly shown an invert (see A on accompanying illustration). One of the gentlemen present argued that the usual practice was to build the abutments first and put the invert in afterwards. I had said that the invert should be built before the abutments were built up higher than the dotted line; their face portions would then be built upon the inverted skewbacks, which would radiate to the centre of the curve. He said such skewbacks should not exist, but that the invert should be put in between the walls as shown at B, so that no portion of the abutments would rest upon the invert. This theory of his is quite new to me. Please say what you think of it."

Given a small invert to be constructed on ordinary ground and under ordinary conditions

RECONSTRUCTING AN OLD BRIDGE.

we would certainly proceed as indicated at A. Of course, it is easy to imagine circumstances under which an engineer would prefer to build his abutments first, as, for instance, when he expected an uneven settlement, but the usual practice is shown at A.

STORY AND HULME.

Architectural Text-books.

Sunderland.—Enquirer writes: "Please say what text-book I could use for a class in architecture as laid down by the Science and Art syllabus; also for architectural design."

We do not quite understand what our correspondent means by "a text-book for a class in architecture." For historical architecture we should suggest Fletcher's "History of Architecture" (10s.), or Roger Smith's "Classic and Gothic Architecture," 2 vols, 4s. each. For the Orders of architecture we should recommend Mr. Spiers' book "Orders of Architecture," price 8s. 6d., and for building construction Mitchell's or Rivington's books. The foregoing books can all be obtained from Mr. B. T. Batsford, 94 High Holborn, W.C.

St. Benit's Abbey, Horning.

London, N.E.—T. R. T writes: "Do you know of any book or books giving information about the ruined abbey of St. Benit, Horning, Norfolk, near the mouth of the river Thurn?"

We do not know anything of the Abbey of St. Benit, Horning, and are afraid that all our correspondent will be able to get will be a chance illustration in some big book on Gothic architecture. We would suggest that the best thing he can do is to obtain some local guide giving perhaps a description of the building.

Engineering Notes.

Bradford Railway Extension.—The Bradford Master Builders' Association has expressed regret at the action of the directors of the Midland Railway Company in shelving the Royston to Bradford main line scheme, and hopes that the delay may not be of long duration.

A new Electric Light Generating Station at Battersea is in course of erection; the foundation stone was laid last Saturday. The site in Lombard Road has cost about £22,000, and another £50,000 will be the cost of the buildings when completed. Mr. Stanley Peach is the architect, and Professor Alexander Kennedy has devised the scheme.

New Railway in Oxfordshire.—The Banbury branch of the Great Central Railway was opened last week for passenger traffic. The new line is nine miles long, and leaves the main line at Culworth, joining the Great Western at Banbury. The journey from Oxford to Leicester can now be accomplished in an hour and a half.

National Harbour at Dover: Ingenuity of the Contractors.—In order to expedite the works in connection with the construction of the National Harbour at Dover, the contractors have fixed some very ingenious electrical machinery, which, amongst other purposes, will be employed in the making of the 40-ton blocks used in the deep-sea work. There has been recently erected on the eastern section a 60-ton Goliath for employment in connection with the diving bells and a 20-ton derrick with 70ft. radius for use in continuing the eastern arm works. A 40-ton Goliath is being erected on the reclaimed land at East Cliff and four more similar machines are to follow at once. Of the new sea wall at East Cliff about 3,800ft. are completed except for the coping. At present the contractors are devoting attention to the protective stone apron at the foot, and about one-third of this work has been completed. A novel time-saving device is employed in connection with the blockmaking. The ballast required is run from Sandwich over the contractors' light railway, and is tipped into a store or "bin" excavated in the chalk at the top of East Cliff. In the bottom of this bin are outlets, from which small waggons are filled. They are then run down an incline and deliver their load to the electrical mixers, which travel at once to the block-boxes, mixing the concrete as they travel and depositing it straight into the boxes, after which the mixers return to be recharged.

London Tramways: Last Session's Work.—Mr. Benn, chairman of the Highways Committee of the London County Council, calculates that if London is to be as well served as, say, Glasgow, it would be necessary to add immediately 156 miles of tramways to the London systems. The County Council have not been idle. During the past session of Parliament they promoted successfully two Bills which are of distinct value, as they give power to the Council to convert all their existing tramways to electric traction, and, secondly, authorise the construction of various sections in North London, which, unimportant in themselves, are necessary to connect and develop the lines already being worked. But the Council have found it necessary to withdraw two schemes which were particularly promising. One provided for an extension from the Streatham terminus, near the Tate Library, to the Croydon boundary, there to meet and connect with the tramways passing through the borough; and the other to double the line, now worked singly, with passing places, between Vauxhall and, by way of the Oval, Camberwell Green. Both were withdrawn on account of the opposition of local bodies, but neither has been abandoned, as further negotiations may result in agreement. The London County Council have also obtained power to convert the tramways between Westminster and Tooting from horse to electric traction.

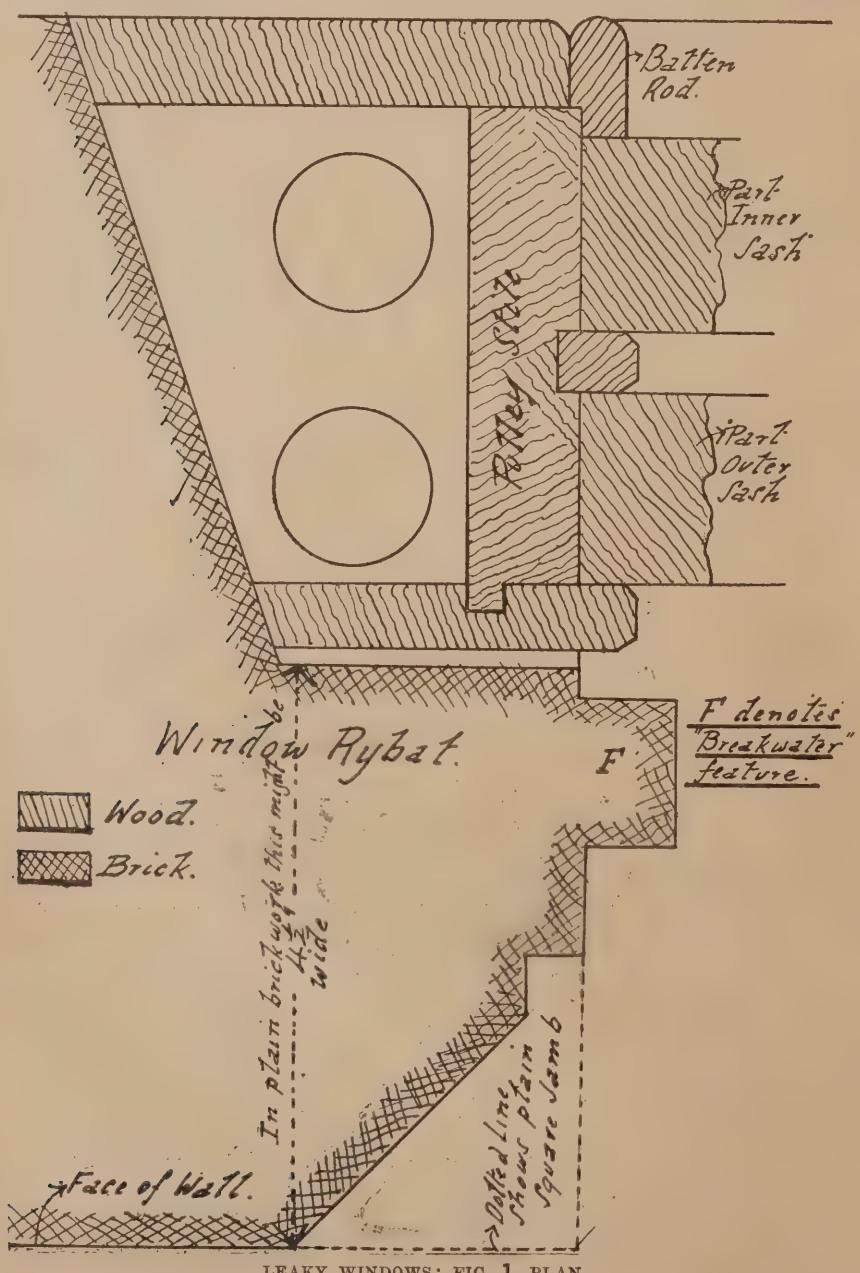
Law Cases.

Solicitors as Speculative Builders.—At the Birmingham Summer Assizes on Wednesday last, before Mr. Justice Wills and a jury, the case of the *Wolverhampton Corporation* v. *Emmons* was heard. In this action the mayor, aldermen, and burgesses of Wolverhampton sued Samuel Emmons, of Wolverhampton, solicitor, to compel him to fulfil a contract with regard to building on certain land in Canal Street, Wolverhampton, or in the alternative to pay damages for breach of the contract. Mr. A. T. Lawrence (plaintiffs' counsel) explained that in 1877, under an Act of Parliament, the Wolverhampton Corporation set on foot an improvement scheme, under which at various times they sold land in different parts of the town. Some land in Canal Street was acquired by the defendant from a person who bought it from the Corporation, under a covenant to build upon it within a specified time. Defendant, who, of course, took over this obligation with the land, submitted a plan for the erection of seven houses, but though the plans were accepted the houses were not built. Fresh plans were submitted subsequently, and received the approval of the Council, subject to certain conditions. The time allowed for building on the land elapsed ten months ago, but no steps had been taken to fulfil the undertaking. The result was that the owners of neighbouring properties had suffered from the incomplete state of the street, as well as the Corporation. Evidence was given by Mr. Bradley, the borough surveyor, whose opinion was that the street was one in which shops and houses would let readily. Mr. T. J. Barnett, auctioneer and valuer, estimated the loss to the Corporation at about £90 a year. In cross-examination the witness stated that he had tried to sell the land for the defendant, but had failed, and, in reply to the judge, said that there was no doubt the speculation was a bad one. Mr. Jelf, in opening the case for the defence, said that Mr. Emmons's case was an extremely hard one, and the jury, when they had heard the whole of the facts, would in all probability conclude that the defendant ought not to be mulct in damages. Mr. Emmons gave £1,000 for the land and anticipated making some profit out of the bargain by building houses or shops in the street. He entered on the transaction bona fide and with the full intention of carrying out the contract, as was proved by the fact that in preparation for his building scheme he actually pulled down a milk-shop on a site which was bringing him in £25 a year. Mr. Jelf submitted that if any damages were awarded they should be purely nominal. The defendant gave evidence bearing out his counsel's statement, and said that when he advertised for tenders the lowest he received was £6,750. He came to the conclusion that if he spent that amount he would incur a heavy loss, and so he waited to see how things went. He was prepared to build on the land if he saw a reasonable prospect of the shops letting. The Judge: "It comes to this. He is prepared to carry out his covenant when it suits his purpose." His lordship told the jury that it seemed to him there was only one question to be put to them—namely, what damages ought to be paid? They must not assess the damages alone for the ten months during which the contract had so far remained uncompleted, but must consider what length of time might elapse before it was performed. The jury found for the Corporation with £50 damages. With the consent of the defendant's counsel High Court costs in the action were provisionally awarded.

LEAKY WINDOWS.

BY CAMPBELL DOUGLAS, F.R.I.B.A.

WATER being driven in under prolonged wind-pressure at the sides and sills of windows – more especially if with hung sashes —is perhaps the most common annoyance to which anyone is liable whose house is in an exposed situation. The evil is caused by unscientific construction, or ignorance and disregard of natural laws. I was led to reflect on this evil and as to how it might be remedied during personal experience in the building of a country house on the west coast of Scotland exposed sometimes for weeks together to the full fury of Atlantic storms—literally American hurricanes. Rain finds its way in most unerringly by the assistance of capillary attraction. No means that are usually adopted checkmate the inevitable results. Window cases may be as well bedded at sides and sills as intelligent workmen can make them, but through almost microscopic cracks water enters and one's placidity suffers.



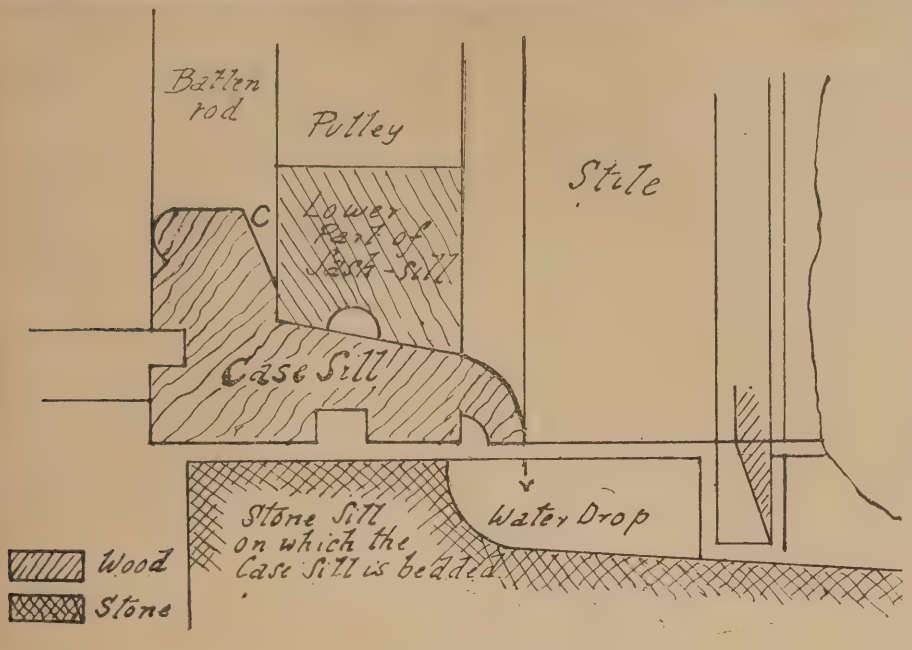
So far as I know, various well-advertised and possibly patent methods for keeping out water break down under the strain of these severe trials, perhaps from want of exact knowledge and its scientific application.

It is almost universally believed that if window cases are well bedded in mortar and painted with white lead or mastic the work will prove efficient. It is not so. If two different materials such as stone (or brick) and wood (or metal) sashes are fitted together in the same plane—even if joined, as I have said, with white lead or mastic—it is impossible but that there should be ultimately developed at the point of contact small, delicate, and almost invisible separations or "hair cracks," on account of the two materials expanding and contracting to a different degree under variations of temperature, providing the required means for the entrance of water under wind-pressure if it be sufficiently strong and prolonged.

Everyone is aware how soon the sills of window cases show signs of decay, which the ordinary building doctor points out to you by prodding it with his knife. His usual remedies we are all too familiar with.

The application of the principle by which water may be prevented from getting in at the junction of window-jamb reveals (or rybat heads, as we Scotchmen call them) and the window case is to introduce on the ingoing a breakwater feature on which the storm may, without doing any harm, spend its force, and will thereafter not have sufficient energy to make rain penetrate the delicate fissures between the inner surface of the rybat head and the outside facing of the window case.

In the much-exposed situation to which I have referred I had no extra trouble or expense in doing so, because, although the native rock of which I had to build the walls was a beautiful and hard gneiss, there was no suitable freestone conveniently obtainable for the dressings, and in such exposure long-continued rain in storm will penetrate freestone; so I executed all dressings with concrete blocks moulded as I desired, building them as if they were made of natural in place of artificial stone. This small square fillet (see F, Fig. 1) is the simple but effective cure so far as the jambs of windows are concerned. Of course the working of this fillet must add something to the cost of stone jambs, but I believe that the extra cost in brick would be trifling—almost inappreciable after the brick-maker has made arrangements for manufacturing his bricks in this way. I need scarcely say that the splay I have shown in my diagram has nothing to do with the cure. The angles may be splayed, moulded, or left plain as in ordinary bricks, but it may be incidentally remarked that the introduction of the fillet adds a slight quality of richness to the baldness of the ordinary reveal, and therefore has a certain architectural value added to its usefulness. So much for my method of keeping water from being forced in at the sides of windows. Now as to my system of constructing the case sill and the stone sill, by which (1) water will be completely—or nearly so—kept out at that part; and (2) the risk of the case sill rotting will be reduced to a minimum.



LEAKY WINDOWS: FIG. 1, PLAN.

I shall take the second point first, the prevention of the decay of the case sill with the change required in the stone sill on which it rests. I suppose that case sills have hitherto been made, more or less, in the present way since double-hung sashes were invented, so that their present breadth is just the survival of the original method of making the case in which the sill, top and sides, were all of equal breadth for the due accommodation of the sashes, and that all the parts might have an equal interest in the result with the help of the pulley stile and the beads and batten rod and sash weights. But on account of the sill being so made (that is, the full width of the two sashes and their guiding rods), the outside part, nearly the half, receives the constant drip of rain—in this rainy land—after it has left the sash sill. The water running over it reaches the stone sill on which it was carefully bedded, but here it soon falls in with our old friend the Hair Crack, horizontal now in place of perpendicular as at the jambs, and when wind blows it is then forced inwards below the wood, and gradually the outer part of the case sill decays and the building doctor prods it, shakes his head, rub his hands and tells you what you must do.

The cure is simplicity itself: one only wonders why it was not thought of sooner. Give up the broad case sill—that is, give up its *outer half*. It does not do any good, but it does harm. It is not required in order to make the framing rigid, for the wood of the case sill being thicker than the other part of the case (although the part which forms the pulley stile of the outer sash has no connecting piece of wood in the sill of diminished breadth) the framing is abundantly strong. All that is then required is to carry the slope of the stone sill further in, so that the drop from the throated edge of the case sill may fall on the stone sill, and be then carried away harmlessly. At first I took other means to steady the foot of the pulley stile of the upper sash at the foot, but I found it was not required.

To prevent rain being forced in with the assistance of capillary attraction under the sash sill of the inner sash, an equally simple treatment of this construction will be sufficient. At that part of the case sill where the sash is shut down against it the usual way is to slope the surfaces of the two sills in what is practically one plane to which each is parallel, and the usual end in view is to get the two to fit as closely as possible, or as nearly so as will leave any chance of raising the sash in damp weather. Reverse this system and (as shown in Fig. 2) cut off a sloping slice from the top edge of the case sill, leaving a small bit at the foot for this to fit against. This will form a V-shaped inside channel or air ditch round the sash sill, and the unimpeded free action of atmospheric pressure does the rest; probably most people would expect it to make the entrance of rain easier. The space (here shown a half-round) run out on the under side of the sash is not very new, but I think it is not used so often as it deserves to be.

I do not very well know how to give a mathematical explanation of its usefulness, but it

LEAKY WINDOWS: FIG. 2, SECTION.

may be illustrated, I think, not inaptly, by one's distress in trying to smoke a hastily, and therefore ill-filled, pipe. You began to fill it properly, then in a hurry left the middle part too loose, returned to the correct style of an expert's filling, with the result that you must refill. In each case you deal with a fluid, and the "drawing" of the pipe is the converse of the storm.

BUILDING TRADES' GIFT TO THE NATION.

MATERIALS STILL REQUIRED.

MR. EDWIN O. SACHS announces that, whilst rapid progress is being made with the erection of the Homes for Discharged Soldiers at Bisley, it has been found that they are still short of certain building materials, so that further gifts in kind are now again invited. The gifts which would be most welcome are the following; any communications or offers regarding these gifts should be addressed to the Executive of the Building Trades' Gift, 1 Waterloo Place, Pall Mall, S.W.:—

Bricks: 30,000 red facing bricks (in two batches of 15,000). *Cement and Lime*: 100 tons of Portland cement; 100 yards of lime. *Terra cotta*: 400ft. (run) coping, 9in. by 6in.; 200ft. (run) sills, 10in. by 6in.; 100ft. (run) coping, 2in. by 5in. *Stonework*: 400ft. (run) coping, 9in. by 6in.; 200ft. (run) sills, 10in. by 6in.; 100ft. (run) coping, 2in. by 5in. *Carpenter*: 10,000ft. (run) 2in. by 4in. rafters and ceiling joists; 3,500ft. (run) 2in. by 9in. floor joists (average 15ft. lengths); 5,000ft. (run) 2in. by 5½in. floor joists in short lengths; 1,000ft. (run) 9in. by 3in. timber for trusses (various lengths). *Joiner*: 2,000ft. (run) 10in. or 12in. moulded skirting; 2,000 squares 1in. thick best yellow flooring. *Doors*: 75 four-panelled doors, moulded both sides to detail, average size 6ft. 6in. to 2ft. 6in., with lining complete; 2,000ft. run 1in. by 4½in. architraves. *Casements and Frames*: 24 large windows, frames fitted with three casements and three fanlights, complete off the bench; 24 small windows, frames fitted with two casements, complete off the bench. *Lead*: 25cwt. 4in. lead soil pipe; 200lb. solder; 10cwt. lead pipe for water supply; 500ft. run ¾in. steam barrel. *Sheet Lead*: 10 tons 5-lb. sheet lead for roof work. *Zinc Sheeting*: 1,500ft. 14 gauge zinc. *Rain-water Pipes*: 1,500ft. 5in. by 3in. guttering; 500ft. run 4in. round or square rain-water pipes.

A Gift for Cottage Homes at Northumberland.—Earl Grey has offered 4,000 yds. of land to the Miners' Committee for the purpose of building cottage homes for aged workmen in Northumberland.

Masters and Men.

Trade in July.—The Board of Trade report that during July employment in the building trades has remained good. The percentage of unemployed union members among carpenters and plumbers at the end of July was 1·8, compared with 2·0 in June and 1·1 per cent. in July of last year. In the furnishing trades employment has continued to fall off; the percentage of unemployed union members at the end of July was 2·6, compared with 1·6 in June and 1·9 per cent. in July, 1899. Employment in the engineering and metal trades has remained fairly good in most branches; the percentage of unemployed union members in this group of trades at the end of July was 2·7, compared with 2·5 per cent. in June and also in July of last year. During the month forty-one fresh disputes occurred, involving 10,244 workpeople; of these disputes only 7 occurred in the building trades, and 8 in the metal and engineering trades. Changes in the rates of wages of about 393,471 workpeople were reported during July, of which number 392,771 obtained advances averaging 2s.1¼d. weekly per head, and about 700 sustained decreases averaging 2s. 7¾d. weekly per head. The nett result was an increase of about 2s. 1¼d. per head in the weekly wages of the 393,471 workpeople affected.

The Cheltenham Builders' Labourers' Strike.—The strike of labourers in May and June last ended in the resumption of work by the men on conditions providing for arbitration of the dispute between the parties. The men had served a notice upon the employers for a rise of wages from 5d. to 6d. per hour, and the masters had served a counter notice for a reduction of wages from 5d. to 4½d. Under the "working rules" agreed to some years ago between employers and employed, this process of notice and counter notice, expiring as in this instance on the 1st of May in any year, was the method prescribed as a preliminary to arbitration, but on May 1st the men struck work under the contention that the rules did not cover a vital question like that of wages and that the arbitration clause ceased to operate when a strike or lock-out took place. After much correspondence and a long conference between representatives of the Labourers' Union and the Masters' Association, it was agreed to leave the interpretation of the arbitration clause and the question of its application to the matter in dispute in the hands of an expert, and that then the parties should proceed to arbitration. This preliminary point has been settled by Mr. J. Waghorne, the Clerk to the Magistrates, who has decided that both the notice and the counter notice must be submitted to arbitration. The parties have now agreed to refer the matter to the arbitration of Mr. O. J. Williams, J.P., the District Registrar.

A Dispute with the Bristol Sanitary Committee.—The building section of the sanitary workmen's branch of the Bristol and South-Western District of the National Union of Gas Workers and General Labourers held a special meeting last week to hear reports on and discuss the new regulations issued by the Sanitary Authority to men in the building section. Mr. H. Brabham, the chairman, stated that on January 1st, according to the building trades' rules in the city the whole of the men in the building trade sent applications to employers for an advance in wages of ½d. per hour. At that time an application was also sent to the Sanitary Committee, and he believed to other committees that were employing workmen under the Corporation. Following upon that, the labouring section of the men belonging to their society sent in asking for an advance in wages of the same amount that was to be given to the employees in the building trade on July 1st. This application referred to about 472 men. On August 3rd the Borough Engineer wrote saying that notice would be given to the workmen classed as being in the building trade to terminate their engagements on the 15th inst., after which such workmen might, if they thought fit, be engaged under building trades rate of wages and terms of employment. The speaker thought this was unjust. It was agreed:

"That this mass meeting of the masons, pitchers, carpenters, bricklayers, plumbers, painters, labourers, and others coming under the new regulations on the 15th of this month, enter their strong protest against the way the Sanitary Committee has acted in this matter, and calls upon them, before putting this new regulation into force, to meet the men's representatives to discuss and draft rules and regulations for those sections of workmen not mentioned in the Bristol building trades' rules." And also: "That this meeting strongly protests against the decision of the Sanitary Committee in introducing the hour system to take away the sick pay and holiday pay that the men have hitherto enjoyed."

Trade Union Federation.—The secretary of the General Federation of Trade Unions has issued his first annual report to the societies which go to make up that body. The Federation was started at a special Trade Union Congress held in Manchester in 1899. It was provided in the rules that no society should be able to come into benefit until twelve months after the first annual meeting. That period has now expired, and the Federation may be considered as fairly on its way to work. At the first council meeting fourty-four societies, representing an aggregate membership of 343,000, or rather more than one-fifth of the trade unionists of the country, were enrolled as members. Since then there has been a period of steady growth, and now the Federation is made up of fifty-nine unions, with a membership of 377,729. It is curious that the building trades are almost entirely absent from it. The only union connected with their industry is the Perseverance Carpenters' Union. The Stonemasons, the Operative Bricklayers, and the Amalgamated and General Carpenters' Unions have not joined. The Boilermakers, too, hold aloof. Almost all the textile trades have joined, with the exception of that important body, the Northern Counties Amalgamated Weavers. The Railway Servants' Union has not yet joined. With large unions in membership the funds of the Federation have grown steadily during the first year of its existence. The expenditure of all kinds only amounted to £672, so that there is now a balance in hand of £21,891. It is especially provided in the rules that the Management Committee shall do all in its power to bring about a settlement of labour disputes by conciliation and arbitration before granting any assistance from its funds.

The New Guard-room at the Tower is now completed, and will be handed over to the military authorities there in a few days. It is situated to the west of the White Tower and is of light terra-cotta coloured brick, having nothing in common, architecturally, with its surroundings. In addition to the quarters set apart for the purposes of the main guard, the block also provides schoolrooms for the soldiers and for the children of the garrison, quartermaster's stores, sergeants' mess, recreation rooms and other offices.

XIX. CENTURY ARCHITECTURE.

RUSKIN'S INFLUENCE.

IN the course of a University Extension lecture on this subject at Cambridge last week, the Rev. D. H. S. Cranage spoke first of the Gothic work in England—its rise, growth, decline, and fall. He then described St. George's Hall, Liverpool, as the greatest building of the Classic revival. Fashion, he said, was the bane of architecture, as it was of many another art, and at one time the fashion was to have in England Grecian temples and huge porticos, the latter of which, during the greater part of the year, were useless and a mistake. As a result they had all over the country noblemen's mansions in the Classic style, and now people found what a wretched thing it was to live in those places when the fashion for them had passed away. Whether they liked them or not, the Gothic revival had produced some of the finest buildings of the century; it was without doubt a national movement, and not one merely amongst architects, and though by some it was said to be dead, he asserted that it showed wonderful signs of life. In dealing with the influence of John Ruskin upon the architecture of the nineteenth century, the lecturer made a passing allusion to some of Ruskin's hostile critics, one of whom, he said, had spoken of Ruskin not as an architect at all, but as a rhetorician. Another anti-Ruskinian asserted that Ruskin's influence upon architecture was very small indeed. But all architects would admit that it was extremely difficult to get the public to take an interest in architecture, and Ruskin was the first to break down that apathy and ignorance. Men of culture were shown that they were ignorant unless they knew something about architecture. Of course, there were limitations to be put upon Ruskin's writings, and they would not go to him for the grammar of architecture. But one thing they might get from Ruskin that neither his critics nor a whole library of architectural books could give them, and that was inspiration. Though it must be admitted that Ruskin's influence was likely to be to some extent ephemeral, it would also be permanent as regarded the inspiration he would always have after his small-minded critics were dead and buried. The lecturer then referred to the restoration of ancient buildings. Restoration, he said, had been as much a work of the nineteenth century as the erection of new buildings. A century ago there was more destruction than restoration. His advice was in the treatment of old buildings to let a church, as far as possible, tell its own tale; to keep everything in it, unless it seriously interfered with the purposes of the church. Nor would he take galleries away simply because they were galleries. He admitted there were sometimes things in a church that were intolerably ugly, and it was quite justifiable to take away anything that hid away interesting features. When a new window was wanted, let it be as much as possible in harmony with the old, but by all means let there be some clear sign about it that was modern. They should always keep a careful record of what they did in this direction, because failure to do this had often caused great mischief. Lastly, let them do everything with common sense, and not run into extremes in the matter of restoration, either one way or the other. Restlessness was the word that summed up the present condition of architecture. Everyone was dissatisfied with modern architecture; fashions changed almost every year, and the architects themselves were thoroughly dissatisfied. Was there, then, no cure for this unrest? The two great styles of architecture—Classic and Gothic—depended upon principles of structure, and was it not possible to have a school of architecture founded on principles that produced the Forth Bridge? He contended for the Gothic style in its main principles. The lecturer, by means of pictures of buildings thrown upon the screen, indicated the lines on which he thought progress in this direction might even now be made.

Sunderland Electric Tramways.—The official ceremony of opening these tramways took place last week; it was preceded by a banquet.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Architectural study—or rich arabesque,
Allegorical dream—or a view picturesque,
Near to Naples, or Venice, Florence,
Or "as harmless as lambs and gentle as doves,"
A sweet family of plump little Loves
Like the Children by Reynolds or Lawrence.
TOM HOOD.

Our Inset Sheets. THE house at Windermere by Mr. Robert Walker, F.R.I.B.A., architect and surveyor, of Windermere, has been built in a central situation for Dr. Mason. The stone of the district has been used for walling, with red freestone dressings, the upper parts being finished with cement rough-cast, and the roofs covered with green Westmoreland slates. It contains—in addition to the accommodation shown on the plans—four bedrooms and a boxroom on the second floor, and larder, store cellar, coal and wood places and heating cell in the basement. The principal rooms and passages are heated by hot water—in addition to the fireplaces—and a lift is provided from the basement to the first floor. The work has been carried out by local contractors under the superintendence of the architect.—Plans and particulars of the new workhouse at Ladywell (Messrs. Newman and Newman, architects and surveyors, London, S.E.) were given in our issue for July 18th last.—The Berkshire County Cricket Pavilion has been erected on the county ground at Elm Park, Reading, one of the finest and fastest grounds in England, being more than twelve acres in extent. The plan explains the general arrangement. Outside staircases lead to the balcony, scorers' room, general workshop for ground staff, &c. The materials are half timber for the external portions, filled in with dark red bricks laid in various patterns. Dark red tiles are used for the roof. The luncheon hall has an open timber roof. The architect was Mr. Geo. W. Webb, F.R.I.B.A., of Market Place Chambers, Reading, and the contractors were Messrs. G. Lewis and Brother, of Reading.

Workmen's Cottages: Big Scheme Begun at Tooting. THE London County Council has just begun to carry out at Lower Tooting quite the largest experiment in municipal dwellings ever made in this country, though there have been some larger schemes on the Continent. Plans have been prepared, and in the course of the next five or six years about 8,200 persons will be living in nearly 1,100 houses on what is now vacant land—Totterdown Fields. The site is half a mile long and about a furlong wide. Great care and thought have been spent on the laying out of the building plots and streets. The principal thoroughfare will be 45ft. wide, beginning from the main Upper Tooting Road and running straight through the centre of the estate for about a third of its length. Here a street of the same width crosses it; and from the cross-street two other streets, still 45ft. wide, run parallel through the middle third of the site. In their turn these two streets are traversed by a second cross street, from which, at a point midway between their terminations, another 45ft. avenue runs to the far end of the estate and opens into Church Lane. Subsidiary streets 40ft. wide run in a network from these main streets at intervals varying from 100ft to 180ft. Four classes of houses are to be built—all of the two-storey cottage type. The plots vary from 15ft. by 80ft. to 12ft. by 45ft. A few of the houses will be built as two-storey flats to accommodate separate families; but these will number only about 160. The idea of the Council has been all through that each family in this new town shall have its own little house quite to itself, and at such a rent as just to pay expenses and leave no charge upon the rates.

Some Figures about the Bradford Plans. AT Bradford recently plans were approved by the Building Committee of the City Council for workmen's dwellings. Of these the "Bradford Observer" says:—"In drawing up the plans everything possible has been done to save expense, but in the estimates a liberal allowance has been made. Six shillings per week should be the outside figure demanded, and it is possible that the rent may be much less. In the estimate 5s. per yard was taken as the cost of the land, but suitable land can be obtained considerably cheaper than this. A capitalist who is content with a modest return for his money could well afford to let the cottages at 5s. per week, even if the cost comes fully up to the estimate of £225 each. Four per cent. on £225 is £9, and at an assessment of £8 the rates would be about £2 12s., making a nett annual cost of £11 12s. Let at 5s. per week the cottages would produce £13, which would provide a small margin for repairs and standing empty. If the capitalist desired £5 per cent. interest he would have to charge £13 17s. per annum to cover the rates as well, and 5s. 3d. per week would bring him in £13 13s. per annum. It must also be borne in mind that the estimates allow for the making of a road 14yds. wide and also a back road. What the capitalist can do the Corporation can do equally well."

Leicester's Sad Experience. ABOUT four years ago Leicester matured a scheme for providing comfortable and cheap dwellings for the poverty-stricken. Their blocks are now nearing completion, but the Council discover that the "poorest of the poor" will never be able to afford the rentals. The tenants who were to have been accommodated are operatives and workpeople, who are already amply catered for by private enterprise. The Corporation originally believed that they could erect three-roomed tenements to let at 2s. 3d. to 2s. 9d. per week, and four-roomed dwellings at 3s 3d. to 3s. 9d., without making any charge on the rates. It has now been found that the lowest rentals must be 3s. to 4s. 1½d., and the higher 4s. to 5s. 1½d. And even then the blocks will entail a small charge on the rates. As there are now hundreds of six-roomed cottages empty in the town, though offered at 4s., 4s. 6d., and 5s. weekly, the municipality in its guise as the "poor man's landlord" has received a very grave shock. Mr. Councillor Walters states that 6d. of the extra shilling in rental has been made necessary by the red-tape exactions of the Local Government Board. No sooner were the original plans submitted to the Board than they insisted upon walls being erected "thick enough to resist an invasion"—a mandate that is not laid upon private speculators. The other 6d. was due to the advance since the inception of the scheme in the cost of land, building material, and the raising of loan interest from 2¾ per cent. to 3¼. Now the Leicester Corporation desire to obtain a longer period than thirty years to repay the principal and to be freed from the shackles of the Local Government Board and the Housing Act. Meanwhile Mr. Walters has undertaken to carry into effect at his own expense a housing scheme of his own for the benefit of Leicester's poor.

In Reply to Professor Church. SOME time ago a committee of experts was appointed by the Dean and Chapter of Westminster Abbey to report on the effect produced on the building by the fumes from the Lambeth potteries. Professor Church, as the mouthpiece of this committee, said that the fumes acted most injuriously on the stonework and, unless stopped, "in the course of not very many years the Abbey will be a ruin." In reply to this indictment the manager of Messrs. J. Stiff and Sons, the well-known potters, said recently to a member of the Press:—"There used to be a great outcry against what were called the 'white salt fumes,' the theory being that they contained a large quantity of hydrochloric acid, which was supposed to be detrimental to stone buildings. As a matter of fact that is practically untrue, and the only other thing that can possibly do any damage is sulphur. There is a certain amount of sulphur in the kilns, and that passes off in the form of sulphuric acid. But in the case of these and of the salt fumes they only pass off for about twenty minutes two days in the week, and you may take it that we do our best to consume them. My point is this, that by comparison

with the smoke from domestic chimneys the fumes from potteries are trifling in extent. It may, of course, be answered that they are much more deleterious, but we have had some of our own terra-cotta on the top of our pipe-making factory, which is the source of the salt fumes, for over thirty years, and it does not show the least softening. Terra-cotta is, of course, harder than Bath stone, but it is not harder than good stone, and you must remember that the Abbey is built of very cheap soft stone."

An Old Inn. THE "Coach and Horses," an old wayside inn facing the Chiswick Road, near Turnham Green, is now being demolished, and with it and the laying out of the adjoining market gardens for building purposes, goes the last vestige of the rural road from London to Gunnersbury. Until quite recent years hedgerows and barns occupied the sites of the adjacent shops by the junction of the Goldhawk Road with the Chiswick Road at the spot called "Young's Corner"; but the district has now been altered so greatly that it is nothing more than an extension of London. Old times and new are in sharp contrast in the pulling down of the humble old roadside inn and the building of a palatial new one behind it, operations going forward simultaneously. It was never a house famed in story or legend, but with the drivers of the market carts and the hay waggons pulling up at the roadside water-trough beneath the swinging sign to give their horses a drink it greatly resembled one of Morland's characteristic old pictures of rural life.

Not Usual. IT is not often that the foundation stone of an important public building is laid by a gentleman who, in addition to working daily as a stonemason, acts as chairman of the local vestry, and officiates from time to time as a magistrate. Such a combination was, however, seen at Battersea on Saturday last, when Mr. William Matthews, J.P., chairman of the vestry, laid the chief stone of the big generating station from which the "municipal Mecca" will in course of time receive its supply of the municipal electric light.

Slate Roofs. PEOPLE living in houses with slate roofs, says the "Globe," have learned this summer, if the sun never taught them to realise it before, that the slate is about the most intolerable form of roofing for hot weather ever devised by mortal man. "It is, we fear, too late to plead for the abolition of the inexpensive slate and the re-introduction of the more costly tile; therefore the question is to find out some way whereby the effects of the heat on slate roofs may be at least minimised. One such way is the whitewashing of the slates. This is simple and economical, and it may even be said that it is artistic. For of all ugly things in the suburbs, more ugly even than the unbroken line of flat-faced stucco villas, are the two long and depressing parallel lines of monotonous slates. 'Slate-coloured' is a term synonymous with all that is melancholy, and to cover this leaden hue with a coat of gleaming white is certainly to add a touch of gaiety (even though it be a poor one) to our long unlovely streets. But we could wish that architects in their plans for modern villas would adopt that style of architecture which so raises the façade of the house as to hide the roof altogether. That is one way to lessen the hideousness of the ubiquitous slate, and one way of making the summer business of whitewashing the roof something less dangerous to life and limb. Short of a return to tiles, the most beautiful of all forms of roofing, we can think of nothing so likely to mitigate the ugliness of our streets."

St. Dunstan's-in-the-West. IN consequence of the faculty granted by Chancellor Tristram for the building over of the fore-courts of St. Dunstan's Church it has become necessary to consider the advisability of removing three of the interesting features for which the Fleet Street church is noted. To the east of the entrance and standing on a ledge between 15ft. and 20ft. from the ground is the only statue of Queen Elizabeth to be seen in London by the street sight-seer. It formerly occupied a niche in Lud Gate. In closing in for the new buildings this statue must either be removed or blocked out of sight, and the necessary steps are to be taken to remove the statue of the maiden Queen to a spot where her monument will be seen. On the west side of the church front is also a tablet placed to the memory of Izaak Walton, but this is already hidden behind the new Law Life offices now being constructed. It is probable that the tablet will be removed and placed in a conspicuous place inside the church. The third monument is the famous St. Dunstan's fountain, the only one in Fleet Street, and the only one in the City with a thermometer and barometer attached; it was presented to the church by the late Alderman Sir Francis Duke, Knt., a one time Lord Mayor of London and alderman of the ward. At present it is not quite certain what will be done with the fountain, but already the weather indicators have been removed.

Lead Poisoning. THE Home Secretary just before the close of the Session prepared a draft of amended special rules for china and earthenware manufacturers, and these rules have since been submitted to the employers for consideration prior to a formal service. The first of them requires that the lead must, after January 1st next, in every case be "fritted"—a process that renders it much less injurious and which the general body of manufacturers agree can be done without any serious detriment or inconvenience. Rule 2, if worded as intended to be applied, strikes a deadly blow at the English manufacturer, and gives an enormous advantage to the foreign competitor. It reads:—"After July 1st, 1902, no material containing lead which yields to a dilute solution of hydrochloric acid more than 2 per cent. of its dry weight of a soluble lead compound calculated as lead monoxide when determined in the manner described below shall be used in any place or process included in rule 1." The objectionable part of this rule is found in the restriction to 2 per cent. of lead. The processes scheduled in rule 1 include colour-dusting, colour-blowing and ground-laying, and none of the colours used (with the exception of four) can be made with so low a percentage of lead as that prescribed. In fact, some of the colours contain as much as 60 per cent. of lead, and are absolutely useless with a lower proportion. These colours are exported in considerable quantities by English colour-makers to Germany, France, America, and even to the Antipodes, and are used by our competitors without any restrictive Government regulations; so that the foreign manufacturers will flood our markets with ware decorated in colours our home manufacturers cannot touch.

Paris Exhibition Awards: Successful Architects. OF the twenty-seven grand prizes awarded in the Art Section of the Paris Exhibition, Great Britain obtains two—Sir L. Alma Tadema and Mr. Orchardson. No foreign country has secured more than two grand prizes, and the United States, Germany, and Belgium are the only foreign countries that have done as well as Great Britain. Mr. Sargent and Mr. Whistler are the American grand medallists. The lion's share of the grand prizes—ten, to wit—go, of course, to French artists, to Benjamin-Constant, Cazin, Dagnan-Bouvert, Harpignies, Hébert, Henner, Henri Martin, Marot, Roll, and Vollon. Great Britain obtains six gold medals out of a hundred and seventeen awarded. Germany and Italy receive the same number, and the United States one more. France accounts for forty-seven of the gold medals. As regards the silver medals, Great Britain has done exceptionally well, having obtained twenty-six, a number considerably larger than that of any other foreign country. In architecture gold medals have been awarded to Mr. John Belcher, A.R.A., Mr. T. E. Collcutt, Mr. William Emerson, P.R.I.B.A., Mr. E. L. Lutyens, and Mr. Aston Webb, A.R.A. (Rappel). Silver medals were granted to Messrs. Austin and Paley, Mr. J. J. Burnett, A.R.S.A. (Rappel), Mr. W. D. Caröe, Mr. C. Clowes, Mr. H. Field, Mr. W. Leiper, R.S.A., Mr. E. J. May, Mr. E. W. Mountford, and Mr. L. Stokes. Bronze medals were gained by Mr. Basil Champneys, Messrs. Lanchester, Stewart and Rickards, Mr. A. Mitchell, and Mr. A. Beresford Pite. In the section devoted to sculpture, Mr. T. Brock, R.A., Mr. G. Frampton, A.R.A., and Mr. H. Thornycroft, R.A., were each awarded a grand prix; gold medals went to Mr. C. J. Allen, Mr. A. Drury, A.R.A., Mr. W. Goscombe John, A.R.A., Mr. A. C. Lucchesi and Mr. J. M. Swan, A.R.A.; silver medals to Mr. F. Bowcher, Mr. W. R. Cotton, Mr. H. C. Fehr, Mr. Herbert (Canada), Mr. F. L. Jenkins, Mr. E. R. Mullins (Rappel), Mr. H. A. Pegram and Mr. F. W. Pomeroy; bronze medals to Mrs. Bruce (Canada), Countess Gleichen, and Mr. A. Toft; while Mr. G. Bayes, Mr. D. B. McGill, Mr. P. Macgillivray, A.R.S.A., Mr. G. K. Mahatre (India) and Miss Wallis (Canada) were honourably mentioned.

Running Solomon Close. THERE are few buildings in the world which have been erected without a single blow from a hammer. The honour of building a temple without the sound of a hammer has hitherto been held by Solomon, but the architect who designed the vitrified clay church in Chicago competes pretty closely with the learned king. There is not an inch of lumber or a nail in the whole structure. The entire ceiling is of brick and tile vaulting, the key-stones being of terra-cotta, and the ribs of the arches and groins of moulded brick.

A Generous Offer. AT the recent Wirral and Birkenhead Agricultural Show the president, Mr. W. H. Lever, in the course of his address remarked that although the landowners and farmers were paying every attention to machinery and the production of crops very little had been done towards providing the agricultural labourer with a proper house. To show what could be done in this direction he was prepared to hand over to the Committee a sum of £50 a year for three years to be offered as prizes for the best plans or models of cottages suitable for that purpose. It is hoped that the Committee will accept his generous offer, and that particulars of the competition will be published in due course. The condition of the agricultural labourer is not so bad as it used to be, but it is still bad enough, and only those who have personal knowledge of the rural housing question know the wretched condition of the houses in which the mass of the "sons of the soil" exist.

Moorish Architecture. IN the course of a series of articles which Mr. Ellis Ashley is contributing to the "Manchester Guardian" on Barbary, he remarks: "We see in Fez a capital of Barbary in activity. In Mekinez and Morocco City we have Moorish capitals in repose. The highways of commerce have left them; the cities are mere sleepy relics of the past. . . . If you would see Moorish architecture at its best you must see it where the Christians have preserved it intact in Spain. But if barbarous grandeur and suggestion of bygone greatness inspire you it is necessary to see Mekinez itself. Everything has been on a scale of magnificence and immensity in the city of old, and even in Mekinez of to-day the inhabitants live in better circumstances than the people elsewhere in this strange land. Wherever one steps in Mekinez there is a legend or a history, a tragedy or a marvel of the past to inspire us. Great vaulted subterraneous cellars extend—how far no one knows—which once were the receptacles of the riches of Sultans, and the tombs of countless wretches who met with those Sultans' displeasure. Above the immense gateways we may still see heads of rebels stuck on poles, reminders for the ill-disposed that the Sultan has a short way with erring tribesmen. You detect pillars and stone slabs which it is certain were never wrought by Moorish craftsmen, and you learn with horror that these vandals had brought them ready made from the ancient Volubilis, twenty miles away—the workmanship of Rome's architects and builders pulled down in order to save the Moors trouble. Roads there are none, and the caravan tracks pass through heavy sand over hill and dale."

Builders' Notes.

Building at Ayr.—Plans for the following have been passed:—Four dwelling-houses, Prestwick Road; four dwelling-houses, Green Street; two dwelling-houses, Craigie Road, Green Street; dwelling-houses, Whitletts Road; dwelling-house, Ashgrove Street.

Improved Dwellings for Government Workmen in Prussia.—A sum of £250,000 is to be disposed of by the Prussian Government to provide improved dwellings for workmen and subordinate officials in Government employ. A similar sum was granted for this purpose in 1895.

Ratable Property.—The Local Government Board have issued a return on ratable property in England and Wales, according to which the ratable value of "lands" was in 1899 less by £8,522 746, or 21 4 per cent., than it was in 1870, and the ratable value of—

	£	Per cent.
Buildings was	61,278,638,	or 111·1 more in 1899 than in 1870
Railways was	10,726,953,	or 220·2 „ „ „
All other kinds of ratable property was	7,269,579,	or 145·2 „ „ „

Dear Coal and the Brick Trade.—The increase in the price of coal has seriously affected all branches of the brick trade in the Black Country. Some manufacturers state they are unable to obtain remunerative prices, and rather than make bricks for stock they will temporarily close the brickyards. The week before last the majority of the brickmakers were employed only about two days, and others have been thrown out of employment altogether.

Uniform By-laws.—At the last meeting of the Cleckheaton District Council the General Purposes Committee reported that they had instructed the clerk to call the attention of the Local Government Board to the disadvantage suffered by the town owing to the variation of building by-laws as between their own district and those adjoining, with special reference to the building of back-to-back houses, and to suggest that the by-laws of the several districts should be identical. The resolution embodying this instruction was duly confirmed by the Council.

The Building Trade in Bowness and district has of late received a considerable impetus. In North Street the Police Commissioners have just completed the erection of a three-storey tenement, while another large block of buildings is in course of erection in South Street. In the Corbiehall district extensive building operations are also being carried on, while a large five-storey structure is nearing completion near Kinneil, to be used by the Distillery Company, being an extension to the present works. It is anticipated that a number of the older tenements in the centre of the town will shortly be demolished and more modern structures erected instead. There is a growing demand for dwelling-houses of a good class, and there is a probability that a number of these will be erected in the Braehead district. The Burgh Commissioners are encouraging local builders in the upper parts of the burgh.

Fire Prevention Tests.—With the close of the British Fire Prevention Committee's summer session, Mr. Edwin O. Sachs, as chairman, makes the following announcement regarding the fire tests carried out under the auspices of that body, which will give some idea of the amount of work done in the form of investigations, quite irrespective of the general duties of the Committee. Since the Committee's incorporation, namely, during a period of eighteen months, there have been twelve tests with fire-resisting floors and two with ceilings; and there have been nine tests with fire-resisting partitions. There have been no less than twenty-three tests with different forms of wood and iron doors and eight with various forms of glazing. Besides this, there have been several odd tests with treated wood, with fire curtains, fire blinds, girder coverings, and safes. Altogether, the tests number sixty-three. The reports on these sixty-three tests are embodied in forty-four publications, many of which are extensively illustrated. An analysis of the attendance at tests shows that, including the representatives of the Council, executive, the various sub-committees and the deputies of the general body of members, the attendance averaged about forty. The working members of the Council were, primarily, Sir John Taylor, K.C.B. (H.M. Office of Works), Mr. Arthur Cates (lately Crown Surveyor) and Major-General Festing, F.R.S. (South Kensington Museum). Speaking generally, the testing station required the attendance of the executive or its sub-committees practically once a week throughout the year, and the heaviest work fell on the shoulders of Messrs. Max Clarke, Hammond, Marsland and Goad; whilst Mr. F. R. Farrow assisted on behalf of the commercial section on almost every occasion. Throughout the work, the executive has been most energetically and ably assisted by their superintendent, Mr. Thomas Kissack, and by Mr. Taylor, their assistant secretary. As has already been announced, the committee has, however, met with the ill-fortune of having to move its plant to new premises owing to the site on which they are now located at Regent's Park being taken up for railway purposes.

Professional Practice.

Dublin.—The new district fire brigade station in Buckingham Street was opened recently. The area of the ground on which the station stands is 2,120 yards and cost £2,250. The station has a frontage of 78ft. on Lower Buckingham Street, is three storeys high, and contains a working department and living accommodation for an officer, seven married firemen with their families and several unmarried men. The officer's quarters are situated to the right of the entrance door, while, enclosed by a glazed screen on the left, is the watchroom, containing the telephone and fire-alarm switchboard and apparatus for controlling the entire working of the station, including lighting, heating and water supply. Opening off the passage is the engine room, 40ft. by 28ft., with steamer and new aërial fire ladder, ready for running, with the suspended quick-hitching harness. At the rear is the stable, 28ft. by 20ft., for four horses. The engine room and stables, which are 16ft. high to pitch-pine ceilings, are lined with glazed bricks and are furnished with patent folding doors. There is also a polished sliding pole from the dormitories above, by which the firemen can slip down to the basement without using the stairway. On the first floor is a dormitory, 28ft. by 25ft., and a recreation room, 21ft. by 12ft., both of which are reached by spiral stairs from the entrance passage below. Quarters for two drivers on the extension of the same floor at the rear are approached from the station yard by an external stairs and balcony. On the upper floor residences for five families are provided in a similar manner. Another sliding pole placed in a recess off the top balcony gives ready access down to the engine room. All the dwellings are isolated. The officer has five apartments, bath room and scullery; and, with two exceptions, the men have three rooms, every family having separate bath room, scullery, and sanitary arrangements. A hose-drying tower, 60ft. high, heated by steam and hot air; a small steam laundry, 24ft. by 12ft.; a workshop, 28ft. by 11ft., with engine repairing and testing pit; a harness room, 12ft. by 11ft.; and forage loft, 40ft. by 11ft., are all entered from the yard, which is also used for drilling purposes. Against the boundary wall in the yard are coal lockers, sanitary accommodation and an open-fronted shelter shed. In the basement under the watch room a small steam boiler, automatically controlled, furnishes hot water for the whole station, steam for the laundry, and will heat the drying tower and portions of the station by means of radiators. The frontage is of red pressed Portmarnock bricks, with moulded granite bases to the piers. All the building is of fire-resisting construction and the drainage is all on the accessible principle. The building was erected from the plans of Mr. M'Carthy, city architect, by Messrs. Pemberton and Son, Charlemont Street, at a cost of £8,000.

Glasgow.—The new washhouse, which has been erected by the Corporation of Glasgow at Bain Square was formally opened last week. The building, which is the fourth of a similar type in Glasgow, has been built at a cost of about £5,000 from the designs of Mr. M'Donald, the city engineer, and under the superintendence of Mr. Thomson, superintendent of the Baths Department. The building contains 44 stalls, each of which gives accommodation for one woman to wash clothes. Washers pay 2d. per hour for the use of a stall, and this contribution also entitles them to facilities for wringing and drying the articles they have cleansed. The wringing is done by means of six water-driven hydro-extractors. The City Improvement Trust, in the course of their operations at Bain Square, found that they had a large amount of space behind their tenements; and instead of utilising it as a back green, and erecting several little washhouses, they so constructed this washhouse that the roof, which is flat and of concrete, forms the back court for the tenements. The tenants of the Improvement Trust property had the use of the washhouse at half rates, as they had no wash-houses of their own. These small establishments are more remunerative than the large washhouses, and the committee desire to multiply these small washhouses in the industrial wards.

Kingseat, Newmachar.—Mr. A. Marshall Mackenzie, A.R.S.A., has prepared plans for the new asylum at Kingseat, Newmachar, to be erected by the Aberdeen City District Lunacy Board. The plans have been unofficially approved by the General Board of Lunacy. A deputation from the Aberdeen Lunacy Board visited the newer and more important asylums on the Continent, with the view of obtaining information which might be of service in dealing with the present important project, and reported in favour of the adoption of the segregation system of lunatic asylum, which was found in high perfection at the Alt Scherbitz Asylum, belonging to Prussian Saxony and situated about six miles from Leipzig, and where the object of the whole scheme of construction and administration is to make, as far as possible, the condition of the patients similar to that of sane people living in an ordinary rural community. The favour with which the Alt Scherbitz plan of asylum is regarded is steadily increasing in Germany. It is also gaining in favour in the United States, and even in our own country the design of Alt Scherbitz has been largely followed in the construction of private asylums. From their detached character, the new buildings at Kingseat do not afford the scope for architectural effect which is obtained by the erection of one large, massive structure. The asylum will be erected on two fields on the farm of Nether Kingseat, on the south-east side of the road which divides the estate. The site lies to the sun, and has a gentle slope to the south, and the range of buildings will cover upwards of fifty acres. The hospital will provide for about 700 inmates and stands in front of the administrative block, with a recreation hall separating the two buildings. There will be observation wards for male and female patients, convalescent wards, and what are described as closed villas, where patients will be kept under observation until in a condition to be transferred to the open villas and afterwards to the working "colony," which is a feature of the Alt Scherbitz system. The administrative block will consist of three storeys. On the ground floor there will be the medical superintendent's room, board room, waiting room, bath rooms, &c.; on the first floor, bedrooms and smoking and billiard room for the male attendants; while the second floor will be wholly given up to bedroom accommodation. The female attendants and nurses will be accommodated in quarters erected to the west of the administration block and provided with an amusement hall, tennis court and other means of recreation. The medical superintendent's residence, the gardener's house and the steward's lodge will be built facing the public road. This new building scheme involves an expenditure variously estimated at from £60,000 to £100,000.

Lynton.—The new Town Hall, presented by Sir George Newnes at a cost of £20,000 in commemoration of the Queen's Jubilee, was opened last week. The building has been in

course of erection for two years. The style is a mingling of the Tudor and Elizabethan, and it is built with local Shambleway stone and Ham Hill stone dressings. The woodwork is entirely of oak, elaborately carved. The front is half timbered in oak in the upper part, with a surrounding balcony, having oak balusters and balustrade, stone-mullioned windows and red-tiled roof. In the centre of the balustrade of the speech gallery there is to be a handsomely carved panel, which is also intended to ultimately contain a representation of the Lynton arms. The building has a frontage of 80ft. and a depth of 75ft. and is built exactly due east and west. A sun-dial is placed over the main gable of the highly ornate semi-elliptical porch entrance, from which a few broad steps lead to the vestibule in the front centre of the building. From the entrance hall a grand oak staircase, 12ft. wide, afterwards dividing into two sections, leads to the music hall on the first floor. The ceiling over the staircase is elliptical-shaped, with heavy moulded oak beams and cornice and carved corbels. At the head of the staircase are two large entrances into the main hall. Panelled in oak throughout, with richly ornamented and elaborately carved girders, this hall extends the whole length of the building, measures 72ft. by 34ft., and will seat over 500 persons. A platform with oak front is erected at the east end, with retiring room. The roof is an elaborately carved open-timbered one, with cornices and wainscot panelling in oak. The five oak trusses, with curves throughout their length, add to the appearance. A spring floor for dancing is added. There are six exits from this main hall, with a special exit leading to the balcony, which runs round the building to the east end and has an external staircase, so that the room can be emptied in three minutes in case of fire. A gallery extends from the front of the balcony immediately above the main entrance. The interiors of the turrets form octagonal bays or ante-rooms (with ribbed oak carved ceilings) leading out from the hall, and are specially designed to give access to the speech gallery and the outside staircase. Leading into the hall near the top entrance is a reception or supper-room, with an irregularly-shaped lobby finished in oak—a very difficult piece of work. Extending across the room at one end is a fine "entertainment" platform, connected with which is a retiring room, lavatory, &c., and private staircase. The various fireplaces will be supplemented by radiators, which (connected with an extensive hot-water arrangement) will heat the various parts of the building. On the left of the vestibule on the ground floor is the Council chamber, surveyor's room, clerk's office, together with cloak room, &c. On the right are the caretaker's rooms and also the recreation and reading rooms for the Working Men's Institute. The floors are fireproof and doors open outwards. The building is electrically lighted throughout. To prevent damp or rain from driving through, the external walls are doubled throughout. The main chimney shaft is carried through independent of the outer walls, and ventilation is effected by hidden electric fans. Almost throughout the flooring is of oak blocks, while most of the doors are in oak. The various doors possess specially-made locks and a number have brass lever handles. At the rear of the property are located police offices and cells. The grounds will probably be laid out with fountains, &c. The architects of the building are Messrs. Reed and Macdonald, of Bond Street, London. The erection has been carried out by Mr. Bob Jones, of the local firm of Messrs. Jones Brothers.

Saltney.—The foundation stone of the new Primitive Methodist Schools at Saltney was laid last week. The site is in Hawarden Road. It is not intended at present to proceed with the chapel, although the foundations have been put in, and the plans show a building 60ft. by 40ft., which will be capable of accommodating 400 worshippers. For the present, however, the erection of a new schoolroom 45ft. by 30ft., with five class rooms, which together will accommodate 300 children, is being proceeded with. The school is estimated to cost £750, and the site has cost £103. The architect for the new buildings is Mr. Hallam, of London, and the contractor Mr. Joseph Challinor, of Saltney.

Trowbridge.—The design illustrated on this page was submitted in a recent competition for Technical Schools at Trowbridge. The materials proposed to be used were coursed rubble with ashlar dressings for the walls and green Westmoreland slates for the roof. Mr. M. Starmer Hack, of London, W.C., was the architect.

DESIGN FOR TECHNICAL SCHOOLS AT TROWBRIDGE. M. STARMER HACK, ARCHITECT.

Keystones.

Three stained-glass windows and a memorial brass have been erected in the chancel of Clonfert Cathedral.

An Infectious Diseases Hospital at Dewsbury is being erected at an estimated cost of £23,000. Mr. G. A. Fox is the architect.

A new Church House at Hungerford, the gift of Sir W. G. Pearce, was opened recently. The building is to be used for lectures, concerts, &c., and there is a club-room for men of the town. Mr. Blomfield is the architect.

A new Church at Elland is being erected. It is to be in the Early English style, in accordance with plans prepared by Mr. G. H. Fellowes Prynne. It will, when complete, afford seating accommodation for 800 adults, and it is expected to cost £14,000, but the execution of the full scheme is not contemplated for some years. The part now to be proceeded with will accommodate about 400 persons, entailing an outlay of between £7,000 and £8,000. Toward this amount £4,000 has already been raised.

A Discovery of Early Remains in London.—The City authorities lately determined that excavations should be made under the old wall at the rear of St. Giles's Church, Cripplegate, to determine whether the old mediæval bastion there existing covered any remains of the old Roman bastion supposed to have existed thereabouts. The first excavation has brought to light about 7ft. of a wall of bastion that probably dates from 1648, about 5ft. below the level of the churchyard, which is about 16ft. below the street level. The average height of the early wall was from 25ft. to 30ft. An old brick drain shows that the whole ground has been previously disturbed.

The new Church of St. Gabriel, Willesden Green, was struck by lightning during the severe thunderstorm of July 27th. The roof was set fire to and damage done to the extent of £2,000, which is fortunately covered by the insurance. The church was not complete when opened, and as the present accommodation is not sufficient, while the new roof and new floor are being provided it would be a favourable opportunity to effect the contemplated enlargement. The present accommodation is for 600 persons, and the enlargement will provide for a thousand. About £5,000 is needed to complete the church.

The Cambrian Archæological Association last Tuesday week visited Morlais Castle ruins, where the foundations of a Roman camp have been excavated, and Llancaiach House. Mr. William Morgan (Dowlais) read a paper on Morlais Castle, and Mr. T. H. Thomas (Cardiff) read a paper by Mr. C. H. James on the Roman station at Gelligaer. The various points of interests were described by Mr. J. Ward, Cardiff. The foundations of the Roman station now exposed at Gelligaer were looked upon as those of one of the earliest Roman stations in Britain. In the same neighbourhood a cup stone was visited in a field. The stone is a large one, filled with curious hollows. The address prepared by Mr. Charles Wilkins upon Llancaiach House set forth that this mansion of the Tudor era was stated by Mr. George Clark to be one of the most complete and curious domestic remains in the county. On Wednesday visits were paid to St. Tydvil's Church, Merthyr; Llantrisant Castle ruins and church. On Thursday the following places of interest in Llantrisant and neighbourhood were visited:—Beddygwyddel, an ancient cross formed in turf; Vedw Hir; Ystradfellte, and Castell Coch, a paper on which was read by Colonel W. L. Morgan; and Aberpergwm House. On Friday visits were paid to Cardiff, where the castle, the remains of a Roman camp, Black Friars Monasteries and St. John's Church were viewed. Caerphilly Castle, Merthyr, was also visited, while another portion of the party went over Llandaff Cathedral. The Rev. G. Hartwell Jones gave an address on "Some Parallels between Celtic and Indian Institutions."

The death is announced of Mr. W. J. Wilson, Director-General of Reservoirs in Egypt.

An Izaak Walton Memorial is to be placed in Winchester Cathedral. It will take the form of a stained-glass window, overlooking Walton's grave in Prior Silkstede's Chapel.

New Schools at Bridlington.—The Bridlington United District School Board have instructed Mr. J. Earnshaw, M.S.A., of Bridlington Quay, to prepare designs for Central Schools to accommodate a thousand children.

The Spire of Great Marlow Parish Church has been restored at a cost of between £2,000 and £3,000. The work was carried out in consequence of it being struck by lightning and additionally damaged by a violent whirlwind.

A Memorial Window has been fixed at the east end of the morning chapel in Marsden Church. The window has been made by Messrs. Burlison and Grylls, of London. A Southwell brass lectern has also been added to the church.

Whitgift Hospital, Croydon, is again threatened with demolition in order to widen George Street. This venerable institution, founded by Archbishop Whitgift in the reign of Queen Elizabeth, was established for the maintenance of a warden, a schoolmaster and 28 men and women, or as many more, under 40, as the revenue will admit. The matter was referred to in our issues for October 5th, 1898, and June 21st, 1899. Illustrations also appeared in the former number.

A New Temperance Institute at Newcastle.—The North of England Temperance League, Newcastle-on-Tyne, are endeavouring to raise £6,000 to enable a Temperance Institute and Memorial Hall to be erected at the corner of Rutherford Street and Westgate Road. The site is 779 square yards in area. Mr. Guy Wilfred Hayler, architect, has prepared plans for a three-storey building containing offices, a small hall and a large hall capable of holding 1,000 persons.

Glasgow and West of Scotland Technical College.—The main objects of this college are to afford a suitable education to those who wish to qualify themselves for following an industrial profession or trade and to train teachers for technical schools. The institution was founded in 1886. We have lately received a copy of the Calendar for the 1900-1901 session, comprising more than 300 pages of information about the college.

The Improvement of Ludgate Hill Station.—The L.C.C. recently asked the City Corporation for their views on an application for the erection of a kiosk and a block of sixteen shops, with rooms over, in the forecourt of Ludgate Hill Station. The Corporation, however, are pressing the joint railway companies to enlarge and better their station accommodation at Ludgate Hill, and they feared the proposed buildings might hinder these improvements; they have, therefore, declined to consent to the application.

Extensions at Woolwich.—The war in South Africa has suggested the desirability of enlarging the Royal Arsenal and Dockyard at Woolwich. The ancient building slips are now being demolished to meet the demand for increased storage of war material, while the Royal Arsenal is extending its proportions eastward, where additional powder magazines and danger buildings are being erected. On land in Plumstead Marshes, next to the Government works, Messrs. Greenwood and Batley, ammunition manufacturers, of Leeds, contractors for the supply of ball cartridge to Government, are erecting an extensive factory.

The Competition for Improvements at East Bay, Dunoon.—The premiums—£100, £50, and £25—have been given to (first) Messrs. Wardlow and Millar, 109 Bath Street, Glasgow, (second) Mr. James More, junr., 13 Drummond Place, Edinburgh, and (third, divided) Mr. C. J. M. Mackintosh, burgh surveyor, Dunoon, and Messrs. Wylie and Blake, 134 St. Vincent Street, Glasgow. The twenty-three designs sent in will be on view to the public on the 24th and 25th inst. in the Burgh Hall.

Mr. Arthur Tooth died last week at the age of 72. He was the founder of the firm of Tooth and Sons, dealers in works of modern artists.

The Competition for a new Central Railway Station at Melbourne, Victoria, has been decided in favour of Messrs. James Fawcett and H. P. Ashworth, who have taken the £500 prize.

St. James's Church, Northampton, has been extended by the addition of two bays to the nave, north aisle, baptistery, and vestries, giving accommodation for 300 persons, at a cost of £2,100.

The Temple Church suffered in the recent gales: the only stained glass window left in the ancient round tower of the church was loosened, with the result that the upper part of the glass fell out and was destroyed. Its restoration will be carried out as soon as possible.

The Banister Fletcher Bursary has been awarded to Mr. Arthur Stratton, A.R.I.B.A. The bursary has been founded in memory of the late Professor Banister Fletcher to promote the study of seventeenth and eighteenth century architecture in London. Mr. Stratton has made a special study of work of this period, one of these studies being the work of Wren, published in article form in THE BUILDERS' JOURNAL for November 18th, 25th, and December 2nd, 1896.

St. Margaret's Church, Sotterley, has been renovated. The church is chiefly famous for its ancient chancel screen of carved oak, which is said to be 500 years old, but the church itself can scarcely be of that age, though Domesday Book records the existence of a flourishing village with a church in the eleventh century. The work of repair has been proceeding during the past two years. A new oak roof and pulpit and two stained windows have been erected.

The Electric Lighting of St. Paul's Cathedral—Although progress is being made with the work of installing the electric light at St. Paul's Cathedral several months must elapse before the public will have the opportunity of seeing the interior lit by electricity, for the laying of the large number of wires required is a business which takes a long time. Although St. Paul's will be the largest ecclesiastical building illuminated by electricity in this country, St. Matthew's, Brixton, claims the distinction of being the first place of worship so lighted in England. The installation there took place in 1882.

Electricity for Melbourne.—The Victoria Light, Heat and Power Company is the name of a company just formed in Melbourne, Australia, for the purpose of supplying electric current for lighting, traction and power in the suburbs of Melbourne within a radius of ten miles. It is estimated that a capital of £1,400,000 will be required for the undertaking. It is proposed to supply power for driving the factories in the metropolitan area. The tramway project includes a tunnel under the Yarra to cost nearly a hundred thousand pounds, and the electric lines are to be taken across the Williamstown railway line.

A new Die for Society of Arts' Medals.—In the last council report of the Society of Arts it was mentioned that it had been found necessary to prepare a new die for the society's medals, a slight flaw having developed itself in the die which has been used for striking the medals since the year 1863, when the Prince of Wales became president. His Royal Highness's head appears on the new medal, and is a likeness of himself at the present time. In accordance with his desire the execution of the new die was entrusted to Mr. Emil Fuchs, who had previously been very successful in the preparation of a medallion portrait of the Prince. Mr. Fuchs has now prepared the die which will be used in future for the society's medals. No change has been made in the reverse. The first medals to be struck from the new die will be those awarded for papers during the past session, which will be presented to the recipients by the chairman at the opening meeting of the next session in November.

Property and Land Sales.

Hanwell, Middlesex.
Oaklands Estate, Boston Road.
To Small Investors, Members of Building Societies, Builders, &c.

MR. R. J. STEEL is favoured with instructions from the Owner of this well-known Estate to SELL by PUBLIC AUCTION, at the COACH AND HORSES HOTEL, West Ealing, on THURSDAY, August 30th, 1900, at seven o'clock p.m. precisely, 50 FREEHOLD BUILDING PLOTS, the whole of which possess frontages on the Cumberland Road, a new road made, kerbed and sewered by the well-known firm of W. Neave & Son, Paddington, W. The plots possess ample depths, with frontages of 16 feet each, and are suitable for the erection of small villa residences, superior cottage properties, or flats, the demand for which class of property is steadily increasing in this neighbourhood.

FREE CONVEYANCES.

Payment by 10 instalments, if desired. Possession by payment of 10 per cent. of the purchase money.

Particulars of Sale, with plan, may be obtained at the place of Sale; of H. Percy Becher, Esq., Solicitor, 26 Bedford Row, W.C.; of Mr. Sidney W. Barnes, Architect, Cherington House, Hanwell; or post free of the Auctioneer, Broadway House, Hanwell, and Boston Gardens, Brentford.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., 115 Gower Street, W.C. (close to the British Museum).

MODELS.
For Exhibitions or Law Cases.
Illustrations sent of Work Executed.
JOHN B. THORP, 93 Gray's Inn Road, W.C.

R.I.B.A. Society of Architects, Surveyors' Institution, Sanitary Institute, and Civil Service Technical Examinations. Preparation by correspondence, or in Residence.—MIDDLETON and CARDEN, 19 Craven Street, W.C.

ABLE ASSISTANCE given to Architects and others. Designs, specifications, quantities, &c., carefully prepared, moderate terms. — "ARCHITECTUS," 1 West Terrace, Whitby.

QUANTITIES, DRAWINGS, PERSPECTIVES.

TUDOR VILLA, TUNBRIDGE WELLS. 3

QUANTITY SURVEYORS and ARCHITECTS.—ASSISTANCE RENDERED in Taking-off, &c., by the hour, or on commission. References given.—"H. R. A.," 22 Ellison Road, Streatham, S.W. 2

TYPEWRITING OFFICES, Camomile Street Chambers, London, E.C. — Specification, ten typewritten fcp. pages (about 3,000 words), six permanent ink copies (not carbons), 20s. Send MSS. specimen order. Reporting Lectures, Meetings, &c., 10s. 6d.

EVENING or TEMPORARY ASSISTANCE with jobbing accounts, extras, estimating, bookkeeping, dilapidations and sanitary surveys. Very moderate terms. Strict confidence.—BUILDER, care of Preston, 347 Wandsworth Road, S.W.

ARCHITECT and SURVEYOR (with London and Seaside Offices) offers young Architect commencing practice Share of London Offices with a view to mutual work. — Address, ARCHITECT, at Horncastle's, Cheapside, E.C.

PRINTING.

100 BUSINESS or VISITING CARDS, Memorandums, or Billheads, 1s. 2d; 1,000, 5s. 1,000 Handbills, 3s. 6d. Postcards printed on back, 1,000, 5s. Other work equally cheap. Mention this paper for free specimens.—W. COLEMAN, 212 Brunswick Street, Manchester.

BUSINESSES WANTED & FOR SALE.

EXCEPTIONAL OPPORTUNITY.—To be LET or SOLD, the old-established BUSINESS PREMISES of Carpenter, Wheelwright, and Shoeing and Jobbing Smith, with the GOODWILL and STOCK-IN-TRADE of Machinery, and seven horse-power Engine, and Tools, and well-selected stock of seasoned Timber, and all materials required for the above trades. Workshops, Drying Sheds, and good seven-roomed DWELLING HOUSE, all standing very compact on about one acre, with over 100 fruit trees, within 20 minutes' drive of the L. & N.W. main line and Met. Railways Stations. Turnover more than £2,000 per year, and can be easily increased. Has been in owner's hands 17 years, who is now retiring.—Apply to the owner, W. H. DARVILL, Hawridge, Berkhampsted, Herts.

APPOINTMENTS VACANT.

ARCHITECT'S ASSISTANT REQUIRED, with good general knowledge of building construction. Salary 2½ to 3 guineas.—Apply, by letter, to C. J., 32 Bedford Row, W.C.

BUILDER'S ESTIMATING CLERK WANTED; measuring up, assist general routine; must be thoroughly reliable, early riser; permanency.—Apply, stating age, wages required, references, &c., to BUILDER, Box 1,451, BUILDERS' JOURNAL Office.

BOROUGH of HARROGATE.—ENGINEERING ASSISTANT.—The Harrogate Corporation require the services of an energetic Engineering Assistant; salary £90 per annum. Applicants must be accurate surveyors and levellers and good draughtsmen, and possess a knowledge of building construction. Experience of the work of a municipal surveyor's office is also desirable. Applications, stating age and qualifications, together with copies of two testimonials (which will not be returned), to be sent to me, endorsed "Engineering Assistant," not later than Friday, August 31st. Canvassing will disqualify.

F. BAGSHAW, Borough Engineer.

Municipal Offices, Harrogate,
August 15th, 1900.

JUNIOR CLERK (good) WANTED at once for Builder's Office, well up in all office routine. Shorthand and typewriter preferred. — Apply, stating age, abilities, and wages required, to LAURANCE SEAGER, Contractor, Sittingbourne.

APPOINTMENTS WANTED.

AN EXPERIENCED YOUNG MAN aged 24 requires SITUATION as Clerk and Bookkeeper. Highest references.—W. F. P., 30 Corrinne Road, Tufnell Park, N.

ADVERTISER seeks EMPLOYMENT in any Business where a knowledge of Drawing and Photography would prove useful. Moderate salary.—Address, E. D., 83 Albany Street, N.W.

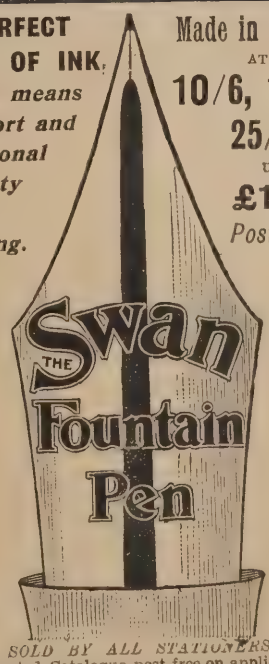
ARCHITECT'S ASSISTANT (25 years), just out of articles, seeks ENGAGEMENT; good draughtsman, surveying, and levelling. — Box 1,452, BUILDERS' JOURNAL Office.

FOREMAN, DISENGAGED; thoroughly practical and experienced in the management of large sawing, moulding and joinery works, buying, conversion of timber and general office work. First-class references.—Box 1,442, Office of THE BUILDERS' JOURNAL.

GENERAL FOREMAN seeks RE-ENGAGEMENT. Good and varied experience. Sober and trustworthy. Good manager of men. Carpenter and joiner by trade. Excellent references.—Apply to T. W., 50 Ingelow Road, Queen's Road, Battersea.

GENERAL FOREMAN seeks RE-ENGAGEMENT. Thoroughly practical in all branches. Good manager of men. Trade, carpenter and joiner. Good references and testimonials.—E. H., 18 Linden Road, Littlehampton, Sussex.

GENERAL FOREMAN, disengaged on 26th August, WANTS JOB; age 34 years; thoroughly practical in all trades; 10 years' London experience as General Foreman; almost an abstainer; carpenter and joiner; references from employers; would take job, new or alterations, piecework labour only, in all trades.—Box 1,463, BUILDERS' JOURNAL Office.



JUNIOR ASSISTANT wants a SITUATION in Architect's office. Recently completed four years' apprenticeship.—T. B. WAIN, The Limes, Heather, Ashby-de-la-Zouch.

PAPERHANGER requires a Builder's or Decorator's work (piecework). — G. W. HARRIS, 43 Leopold Road, Willesden, N.W.

TO BUILDERS. — WORKING FOREMAN (Bricklayer). Experienced in all branches, good references, seeks RE-ENGAGEMENT.—Address, A. HALL, 14 Fairlawn Park, North Terrace, Sydenham.

Trade and Craft.

Stable and Farm Fittings.

Messrs. Oates and Green, Limited, of Halifax, send us a copy of their new catalogue of stable and farm fittings. These are notable for their sanitary nature and cheapness, being made in highly-glazed "Nalethric" fireclay. Horses and cattle nearly always contract disease from infected water or food, or from contact with an infected manger or utensil. "Nalethric" ware being so highly glazed is one of the best materials to use, as it gives no lodgment for germs and can be easily washed down. Messrs. Oates and Green also supply brackets and fasteners for mangers. One of these fasteners, the "Give and Take," is specially ingenious: it consists of a leather belt working on two pulleys, with a weight attached, so that when the horse draws at the chain the weight gives and he can move off to some distance, while as he approaches the manger the weight draws up the chain, preventing his legs becoming entangled. The combined water channel and feeding trough supplied by the firm ensures a constant supply of good water, and prevents any deposit of slime or dirt; there are no spaces for food to collect and become sour or for vermin to harbour, and no projections to injure the cattle. The pump troughs and cisterns made in "Nalethric" fireclay, although primarily intended for farmyards or pastures, are now largely used for feed cisterns to baths in place of the old insanitary wooden lead-lined cisterns. In the catalogue illustrations and particulars are also given of corner mangers; niches for water supply; stable and paving bricks; cattle troughs, cake troughs, continuous feeding troughs, pig and poultry troughs; a pig-feeding shoot specially shaped to prevent the food falling beyond the trough or becoming stuck fast; a patent ventilator for roofs of stables, cow-houses and farm buildings; and an economiser fire-grate and chimney-piece in glazed ware. The London office of this well-known firm is at 27 Chancery Lane, W.C.

Sanitary Fittings for Hospitals.

Messrs. Doulton and Company, Ltd., of Lambeth, have just issued a new edition of their catalogue of sanitary specialities for hospitals, &c. In this branch of sanitation fresh improvements are constantly being made and anyone called upon to specify this class of work should make a point of obtaining a copy of this catalogue. The best water-closet for hospital and lunatic asylum use is undoubtedly one fixed above the floor, to allow it to be kept clean, and this form is almost as necessary for workhouses and offices. The specimens of such closets illustrated in this catalogue are carried on strong iron supports, which are covered by the pottery instead of being built into the wall. This latter method is a common defect, for in case of breakage a new closet cannot be fixed without damaging the wall. In regard to baths, it was for many years the practice to treat cast-iron baths with metallic enamel, burnt on at a high temperature. To avoid the defects of enamelling, porcelain baths were largely in demand, but they were open to objections on the score of weight, clumsy appearance and chill to the bather through the material taking some time to warm. Messrs. Doulton have, with the object of remedying these defects, introduced a vitreous enamel coating for iron baths. The enamel is applied at a great heat and stands wear. It has also been found possible lately to enamel the baths both inside and out. An anti-splash rim is a good thing to have on a bath: this rim is not an overhanging piece fixed on a flanged edge, which would necessitate a joint and space difficult to keep clean, but the roll is cast on the bath. The baths on wheels are especially commendable for bedridden patients. The lavatories and sinks for operating rooms are arranged with treadles for working both valves and wastes. The catalogue also contains illustrations and particulars of sinks, cast-iron wash tubs, steeping tubs and mortuary and post-mortem tables: it is extremely well got up, is well printed, and has a pleasing green wrapper.

The Statue of Balzac, on which Falguière was engaged at the time of his death, is being completed under the supervision of M. Bouillot, one of the sculptor's most talented pupils. The statue was already in an advanced state when Falguière died. The work that remains to be done is slight, and the statue will be ready to occupy the place allotted to it in the Palais Royal before the end of the year. The erection of the statue is due to the initiation of the Société des Gens de Lettres, which gave the commission to Falguière after refusing to accept the endlessly-discussed Balzac executed by Rodin.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

CHATHAM.—For alterations and additions to St. Bartholomew's Hospital, Chatham. Mr. Edwin T. Hall, F.R.I.B.A., architect, 57 Moorgate Street, London, E.C.:—

Holland & Hannen	£14,908	J. H. Harris	£12,929
E. Lawrence & Sons	14,695	C. E. Skinner	12,598
Holloway Bros.	13,950	G. E. Wallis & Sons	12,520
Foster & Dicksee	12,945	West Bros.	12,249

Plumbing Work, &c.

Doulton & Co., Ltd.	£1,177	Dent & Hellyer	£1,074
G. Jennings	1,148		

FETCHAM PARK, LEATHERHEAD (Surrey).—For drainage works, for Mr. J. Barnard Hankey. Mr. A. J. Hardwick, surveyor, Eagle Chambers, Kingston-on-Thames. Quantities by Mr. Ernest R. Babbs, 48 Bishopsgate Street Within, E.C.:—

	Sewage disposal works.	Sewers.	Total.
Steven Kavanagh	£502 11 0	£791 7 6	£1,298 18 6
Ross, Wilks, and Crabtree, Shipley, Yorks*	427 12 6	678 19 0	1,101 12 6

* Accepted.

HULL.—For the erection of three blocks of dwellings, Great Passage Street, for the Corporation. Mr. J. H. Hirst, City Architect, Town Hall, Hull:—

Jackson & Sons	£11,858	F. Beilby	£10,800

Williamson & Co.	1,876 11 11	Thos. Smart, Nottingham*	1,500 0 0
Herbert & Sons	1,850 16 10		
Main, Kendall & Main	1,823 10 0		

Contract No. 2.—Destructor Buildings.

Geo. Duxbury	£5,353 10 3	Johnson & Son	£4,726 11 4
Bradshaw Bros.	4,961 0 0	Needham Bros.	4,609 11 0
Leicester Builders, Ltd.	4,951 0 0	Herbert & Sons	4,549 15 8
A. E. Tilley	4,914 17 8	Williamson & Co.	4,463 13 9
Thos. Herbert	4,900 0 0	Moss & Son, Ltd.	
Main, Kendall & Main	4,895 7 0	Loughborough*	4,440 15 11

* Accepted.

ROEHAMPTON.—For residence. Mr. A. J. Hardwick, architect. Quantities by Mr. E. R. Babbs, 48 Bishopsgate Street Within, E.C.:—

Marriage & Witherington	£1,475	W. H. Lorden	£1,288
Gaze & Son	1,386	Kelsey & Sons, Chessington*	1,146

* Accepted.

SOUTHBOROUGH.—For the erection of school buildings, High Brooms. Messrs. H. H. & E. Cronk, architects, 4 Mount Ephraim Road, Tunbridge Wells:—

Bowman & Sons	£1,920 0 0	Strange & Sons	£1,720 18 0
J. Jarvis	1,821 14 0	J. N. Jeffery	1,692 0 0
Martin & Co.	1,805 0 0		

ST. ALBANS.—For the erection of a detached residence, Manor Road, St. Albans, for Mr. A. E. Hancock. Mr. S. Doddimeade Edmunds, architect, 28 Victoria Street, St. Albans, and London.

Miskin & Sons	£1,450	J. T. Bushell	£1,060
Goodchild & Sons	1,450	E. Dunham*	1,055
Boff Bros.	1,002	[All of St. Albans.]	

* Accepted.

WEST HARTLEPOOL.—For the erection of banking premises, Church and Lynn Streets, for the Yorkshire Penny Bank. Mr. J. Garry, architect, 47 Church Street, West Hartlepool. Quantities by Mr. Geo. Bell, 13 Westgate Road, Newcastle:—

Leeder & Son	£6,223	Watt Bros., West Howe & Co.	£4,896
	5,089	Hartlepool*	

* Accepted, exclusive of fittings, which are of polished teak.

NORTHFLEET.—For the erection of new schools at Old Dover Road, Northfleet, for the Northfleet School Board. Mr. S. I. Adams, F.I.S.E., architect, Weston Chambers, Southend-on-Sea:—

	Schools.	Pavings, &c.	Caretaker's house.	Total.
Foster	£10,158 0 0	£4,760 0 0	£947 0 0	£15,855 0 0
Beal & Hubbard	8,242 5 4	3,692 2 3	728 19 3	12,573 6 10
Davis & Leaney	8,100 0 0†	3,700 0 0	—	11,800 0 0
Davey Bros.	8,075 0 0†	2,955 0 0	—	11,030 0 0
Dupont & Co.	7,263 10 0	2,802 0 0	661 10 0	10,787 0 0
Multon & Wallis*	7,321 0 0	2,840 0 0	634 0 0	10,795 0 0

* Multon & Wallis's tender has been accepted for schools, £7,321; boundary walls, £931; latrines, £329; drainage and filtering tanks, £554); total, £9,135. † This includes caretaker's house.

Building Construction Classes in Glasgow.—The evening classes in building construction and drawing at the High School, promoted by the School Board of Glasgow, open on Monday, September 3rd. The courses of lectures are given by Mr. D. Bennett Dobson, architect, on Tuesday, Wednesday and Thursday between 7 and 9 p.m., and instruction in drawing between 6.45 and 9 p.m. A special feature of the session will be monthly visits to inspect the principal buildings of note in course of erection, and works in progress showing the manufacture of material in and around Glasgow. The conditional fee for the session of eight months is 7s. 6d.

New Patents.

These patents are open to opposition until September 25th.

1899.—Artificial Stone.—14,612. W. OWEN, Pontsarn, Woking, Surrey. This process for the manufacture of artificial stone consists in slaking the mixed materials (say, lime and sand or marble dust) with hot water, moulding them under pressure, and hardening and drying the moulded mass simultaneously by superheated steam.

Tiles, Slabs, &c.—15,102. J. C. SELLARS, 63 Bridge Street, Birkenhead. According to this invention tiles, slabs, &c., are made from slate waste (such as exists in slate quarries), which is powdered, mixed with silicate of soda, moulded and dried. Or Portland cement or lime may be added to the mixture for use as a fireproof cement.

Venetian Blinds.—16,913. S. SMITH, 16 Higher Chatham Street, Chorlton-on-Medlock, Manchester. The slots in the laths are cut longitudinally and not transversely and a tape runs through them instead of a cord. The tapes (one at each side) wind on a spring roller fixed at the top of the window. A cord is wound round one end of this roller and when it is pulled the blind is lowered, whilst on releasing it the blind is drawn up by the spring.

Water-cocks and Hydrants.—21,929. W. R. SAGE, 48 Blackhorse Lane, Ipswich. This invention consists of an ordinary plug cock with a top chamber fitted with a semi-plug that is fixed to the plug proper. By this means all the water that remains in the stand or supply pipe is drained away and the chances of the water becoming frozen are reduced.

1900.—Door Openers.—5,838. E. CONSENTIUS, 36 Grassistrasse, Leipzig, Germany. By this invention a door may be opened with the foot; its use, for example, may be when a person has his hands full and wants to go from one room to another without putting down what he is carrying. Attached to the side rail of the door is a rod which works up and down between guides and has a projecting portion or pedal at its lower end. Its top end is connected with the door handle by a chain. On pressing down the rod with the foot the latch is opened or the bolt pulled back. The rod is returned to its original position by a spring.

Feeding Apparatus for Brick-making Machines.—10,490. H. ALEXANDER, Queen's Works, Water Lane, Leeds. The object of this invention is to so regulate the material as it passes into the pug-mill or hopper that a steady supply is maintained; also to cheapen cost by not requiring a man to feed the machine, this being done from an elevator direct. The special feature of the invention is that a cylinder containing a number of moulds in its periphery is revolved transversely across, and in contact with, the open end of the pug-mill, or in front of a ram working in a suitable hopper, which fills the mould as it passes with a dense clot of clay under considerable pressure.

The following specifications were published on Saturday last, and are open to opposition until October 1st. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—15,117, MILLER, dust bins. 15,263, BRITISH THOMSON-HOUSTON CO., LD. (*Rice*), electric lamps. 16,939, ESCH, plates or sheets for ceilings. 16,986, FIELDING AND SMITH, means for securing or staying lead and other pipes. 17,244, VON REINOLTS, preparation or compound to be used as a substitute for white lead in the preparation of paints. 17,272, WEBER, detachable window frame for saving life in case of fire. 18,226, GILMOUR, steam, water and other valves. 18,747, BRITISH URALITE COMPANY, LIMITED (*Imschenetzky*), manufacture of fire-resisting materials. 18,971, LUCAS, gas lamps. 19,089 ROBERTS, ventilating window blind. 19,123, STUART AND EDMUND, machinery for cutting, carving, engraving, rubbing and polishing stone, metal, wood and other materials. 19,134, PORTER AND BISHOP, door hinge. 19,177 BING, grinding, crushing or pulverising machines. 19,318, CHISHOLM, devices for joining together screwed metal pipes. 19,387, HOLT, SEELEY AND KERSHAW, valves. 20,650, PORTWAY AND GRAHAM, jacks or lifting mechanism. 23,525, RUSSELL, metal weather band for the purpose of keeping doors wind and weather tight.

1900.—5,727, TRUDEAU, electric heating and apparatus therefor. 6,576, SCHOU, method of joining up tubes and closing their ends. 7,925, DUCLOUX, process and apparatus for forming the foundations of structures. 9,342, STUMP AND BRUCKER, double-acting spring hinges. 9,633, PICKHARDT, means for connecting stove pipes to chimney and other flues. 10,049, TALBOT, gas producers. 10,244, ROBINSON, air-grate ventilators. 10,297, BEVIER, process of preserving wood. 10,999, LYNGAAS, automatic fire alarm apparatus. 11,118, OLIVER, mitre-cutting machines. 11,193, SKILLMAN, combination sliding and pivoted window sashes. 11,326, BIRTWISTLE, elevators and conveyors. 11,385, BRAY, acetylene gas burners. 11,614, JACOBS, acetylene gas apparatus.

New Companies.

Kent Land Company, Limited.

This company was registered on August 9th with a capital of £2,000 in £1 shares. The first directors are F. G. P. Neve, G. J. Kimmins and F. C. Neve. Registered office: 1 Bank Street, Tonbridge.

Broughton Estate Company, Limited.

This company was registered on August 7th with a capital of £15,000 in £1 shares to acquire and deal with real and personal property and to carry on the business of builders, &c. Registered office: 1 Delahay Street, Westminster.

Cook and Ddol Slate Quarries Company, Ltd.

This company was registered on August 8th with a capital of £12,000 in £1 shares to carry on the business of quarry owners, slate and stone merchants, &c. The first directors are R. Thomas (chairman), J. O. Hughes, G. J. Hughes, O. I. Jones, W. Griffith, S. T. Dixon and E. A. Spencer.

National Solid Peat Fuel Company, Limited.

This company was registered on August 7th with a capital of £5,000 in £1 shares to acquire the business of the Fuel and Brick Drying Syndicate, Limited, including the patents assigned to the said company by A. B. Lennox, and to manufacture and deal in solid peat fuel and other peat products. Registered office: 7 Victoria Buildings, Lowther Street, Carlisle.

British Pure Acetylene Gas Company, Ltd.

This company was registered on August 9th with a capital of £5,000 in £1 shares to carry on the business of manufacturers of and dealers in acetylene gas and other inflammable gas or artificial light, gas, water and general engineers, &c. The first directors (to number not less than three nor more than seven) are R. Ainscough, H. C. Leigh-Bennett and H. L. Smyth.

Crafnant Slate Quarries, Limited.

This company was registered on August 7th with a capital of £10,000 in £1 shares to adopt an agreement with V. Groom, trading as the Crafnant Slate Quarries, and to carry on the business of quarry and mine owners, slate and stone merchants, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers.

British Silica and Granite Company, Limited.

This company was registered on August 7th with a capital of £7,500 in £1 shares to acquire certain leasehold mines and premises specified in an agreement with W. De Wolf, to crush, win, get, quarry and prepare for market oil, metal, silica, granite, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers. Registered office: 22 St. Mary's Gate, Manchester.

Bishpool Brick and Tile Company, Limited.

This company was registered on August 11 h with a capital of £15,000 in £10 shares to carry on at Bishpool (Mon.) or elsewhere the business of brick, tile and pipe makers, terra-cotta manufacturers, &c. The first directors (to number not less than three nor more than seven) are T. Ponsford, W. A. Jenkins and J. Davis. Registered office: 30 Stow Hill, Newport (Mon.).

Art Pavements and Decorations, Limited.

This company was registered on August 8th with a capital of £25,000 in £1 shares to acquire the business now carried on by De Grelle, Houdret & Co., and to carry on the business of manufacturers of and dealers in mosaics, marbles and parqueterie, &c. The first directors (to number not less than three nor more than five) are J. Houdret, H. de Grelle-Rogier, C. de Grelle-Rogier and H. E. Carter.

Gallow Hill Glue and Chemical Company, Ltd.

This company was registered on August 11th with a capital of £40,000 in £1 shares to acquire the business of the Gallow Hill Glue and Chemical Company, Limited (incorporated in 1896) and to carry on the business of glue and chemical manufacturers, &c. The first directors (to number not less than three nor more than four) are S. Symington, J. Clark, J. B. Meggitt and H. A. Meggitt.

Millard Brothers, Limited.

This company was registered on July 26th with a capital of £35,000 in £1 shares to acquire the business carried on by O. L. Millard and S. E. Millard, at 123 Houndsditch and at Cutler Street and White Hart Street, Houndsditch, E., as Millard Brothers, and to carry on the business of hardware merchants, &c. O. L. Millard and S. E. Millard are permanent directors, with £750 each per annum. Registered office, 123 Houndsditch, E.C.

Furness Vale Silica and Firebrick Co., Ltd.

This company was registered on August 2nd with a capital of £10,000 in £1 shares to acquire the business carried on at Furness Vale, near Disley, Cheshire, as W. J. Hall and Co., and to carry on the business of quarry owners, miners, lime and stone merchants, &c. The first directors (to number not less than two nor more than five) are H. Harley and W. J. Hall (managing directors). Registered office: Furness Vale, Cheshire.

Priestman Brothers, Limited.

This company was registered on August 9th with a capital of £13,000 in £1 shares to acquire the business of Priestman Brothers, Limited (incorporated in 1889), and to carry on the business of electrical, hydraulic, heat, motive power, water-supply and general engineers, motor-car manufacturers, &c. The first directors (to number not less than two nor more than six) are Sir J. Reckitt, Bart., I. Milner, C. Wardlow, G. V. Maxted, E. Hanger and J. R. Whamond.

Jetley's Wood Structures, Limited.

This company was registered on July 31st with a capital of £100,000 in £1 shares to carry on the businesses of wood merchants and workers, joiners, &c., as constructors of wood pavements, flooring, stairs, and wooden and other structures or buildings; to acquire for that purpose the business, manufactory and property of Messrs. V. and G. Jetley. The first directors (of whom there shall be not less than two nor more than five) are to be elected by the signatories to the memorandum of association—H. Williams, V. Jetley, G. Jetley, M. Griffith, A. G. Schiffs, W. Brett and A. Tibbits.

An Architectural Causerie.

Yatton Church.

Much has been heard of late for and against the restoration of Yatton Church, of plans for completing its ancient spire, and of protests against any such course being taken. To West Countrymen in especial any proposal that would make for the alteration of this characteristic landmark along the Great Western's line to the West of England is hateful, and to those who, not being natives of Somersetshire, are yet familiar with its odd-looking truncated spire, looming weirdly across the meadows a quarter of a mile away as the "Cornishman" express dashes through Yatton Station down the straight line at the speed of sixty miles an hour, the completing of it would so alter the appearance of the church that it would never again seem the same building. The loss of the old aspect of Yatton Church would be as the loss of an old friend to many thousands of travellers, and, if only for their sake and for the sake of keeping unaltered an edifice which has preserved the same "unfinished" appearance for centuries, we should not allow this thing to be done. Doubtless an incomplete spire makes to some good folk an eloquent appeal to be finished; but they are those who suffer from that obsession of orderliness, of balance and completeness, which is rather of the housewifely than intellectual nature. Nothing is to be gained and much is to be lost in any such proposed completion. Much injury was done to the quaint aspect of Cologne Cathedral when, after the lapse of many centuries, its unfinished western tower was completed, about ten years since, to harmonise with the other, and at the same time the picturesquely terrible legend accounting for that long-unfinished tower was shattered. Again, the "matching" of the two western towers of Canterbury Cathedral—a feat accomplished by the destruction of an early Norman tower and the replacing of it by a modern imitation of Perpendicular—is an example of what not to do which might make the Yatton proposals impossible.

The church of St. Mary, Yatton, is of the Decorated and Perpendicular periods, and is a noble specimen of ecclesiastical architecture in that county of noble churches—Somerset. It possesses—for the parish church of a rural village—the unusual feature of transepts. Besides the exquisite details of its architecture, it is interesting to archæologists as containing the altar-tomb of Sir Richard Cradock Newton, Chief Justice of the Common Pleas, who died in 1448, his red-robed effigy showing the Collar of SS., said to be the earliest instance of that knightly decoration known. The spire, the proposed completion of which forms so offensive a feature of the restoration scheme, was, for some unknown reason, never completed, and the cresting which marks its sky-line is contemporary with the rest of the work. The justly-admired south porch is seen in the illustration on this page. C. G. H.

Courts and Courtyards.

A very noble feature in a great building is a fine court or, as it is popularly called, courtyard. Once it was general in England, but its use has gradually dwindled and it is now rare; if introduced it is seldom of much architectural importance. The great pressure upon the ground space of London has driven it away altogether, or reduced it to a mere "well," overshadowed by immensely high walls pierced with the monotonous windows of "flats." Here and there an old inn preserves its "yard"; in the Borough there are still a few examples of this once characteristic English feature left, with open wooden galleries running round—upon these the bedroom doors open. In the yards in ancient times plays were acted; at a later period they were busy and full, and the institution of stage coaches made them scenes of great activity. The architectural effect of galleries enclosing an open court is exceedingly effective, even when nothing more pretentious than painted wood is used; it is far better in more ambitious material, but for this we must go to Italy and Spain. Coeval with the great inns, we have the colleges at Oxford and Cambridge built upon a plan which is wholly dependent for its effect upon the quadrangle; "courts" at Cambridge, "quads" at Oxford, in local parlance, these wide smoothly-turfed spaces are surrounded by buildings mostly of the later Gothic or the earlier Renaissance type; there are no buildings in our country more thoroughly English and racy of the soil. The structure is generally of very moderate elevation; this has the effect of throwing into greater prominence the college hall and chapel, both lofty and very boldly designed; a square tower often covers the porter's lodge and gateway; occasionally a fountain, a statue or other object occupies the centre. The effect of a court is pleasant; it shuts out noise, allows air and light to reach every window and door in fuller measure than would otherwise be possible, and it gives a sense of cheerful seclusion.

YATTON CHURCH. DRAWN BY C. G. HARPER.

In London, however, we are confronted by such difficulties in the matter of height and space that an effective relation between the two is almost impossible, and it is doubtful if this generation will witness the construction of another fine court. Of those that have been spared to us Somerset House contains the finest. The building is very stately when seen from the Thames; the court is entered from the Strand front by a fine triple arch, vaulted; the comparative darkness of this entrance emphasises the light airy spacious-

ness of the quadrangle; the whole structure possesses the great merit moreover of immediately suggesting its purpose to the spectator —that it is a Government office. Here, again, though not so low as at Oxford or Cambridge, the surrounding elevation is of moderate height; the whole is Palladian and built of white stone. It is much to be regretted that its architect, Sir William Chambers, is virtually forgotten; but England does not honour her architects.

In the City, the Royal Exchange is built upon the quadrangular plan and the architectural effect of the court is enhanced by a recessed and arcaded lower storey, under which the walls are being enriched by a series of mural paintings illustrating the history of London.

The Houses of Parliament—or more correctly the Palace of Westminster—include no less than seven courts, one of which contains a valuable relic of the previous building, burnt down in 1834—to wit, a fine Tudor cloister with elaborately vaulted roof. The height of the buildings, however, somewhat detracts from the effect of these courts; a great space within or low buildings running round it is necessary if a quadrangle is to be a cheerful one, and a certain amount of greenery in the shape of turf is indispensable.

A very effective approach court is often formed by enclosing three sides only; sometimes the advancing wings are lower than the main building; examples of this are found in late Tudor and Elizabethan houses, such as Blickling, Charlecote, and Hatfield. Unfortunately they are unknown in London; an opportunity for this form of court was lost when building the Charing Cross Hotel.

The fine court of University College, in Gower Street, designed by Wilkins, was long in this condition; latterly a beginning has been made of a fourth side; time will show if it is to be effective; but the street in any case will be the loser. It seems indeed that, in spite of many improvements, the London of the future will be wanting in some important elements of convenience and beauty, and of these the courtyard is the chief. J. C. P.

The Aim of the Architect.

THE primary aim of the architect should not be to make money, but to produce good buildings; not to make architecture pay at any cost, but to make it pay whilst being beautiful—in short, artistic excellence and not commercial success is the first consideration. Cases are numerous of architects with extensive practices whose work is almost devoid of merit, whilst many of their professional brethren with much smaller practices —perhaps with no practice to speak of—are capable of producing the most praiseworthy designs. It is generally the old fault of the poet and the inventor—the want of practical foresight or everyday adaptability. Themistocles the Athenian said, "I cannot fiddle, yet I can make a small town a great city;" to which Bacon adds, in his sagacious way, that "there may be found those which can make a small State great and yet cannot fiddle; as on the other side there will be found a great many that can fiddle very cunningly, but yet as so far from being able to make a small State great as their gift lies the other way." It needs little ingenuity to apply this to architects. The most successful men are not necessarily the most worthy, yet often the most worthy foolishly neglect to observe and practise the methods that lead to success, then zealously rave at the fickleness of fortune. Therefore let the architect first study and practise his art as an art and afterwards make it as successful a means as he can for obtaining the much-despised, though very necessary, "worldly emolument."

R.

On Reflection.

A Word about Memorials.

AFTER a great man has died and we have read his obituary notices it is pretty certain that someone will promote a scheme for commemorating him with brick or stone. The feeling is a right one—we wish to perpetuate an excellence, a virtue or a standard of attainment; but the danger lies in choosing the wrong memorial or in doing something not in accord with the dead man's principles. We have a case of this sort in the scheme now being put forward for erecting a portrait medallion of John Ruskin in Westminster Abbey, at a cost of £500. With such a proposal we cannot sympathise, because, in the first place, it is contrary to Ruskin's views, and, secondly, because it will only add one more to the number of unsuitable monuments in the grand old Abbey. These monuments disfigure the place; they are excrescences; their white marble is in total discord with the solemn colour of the columns and the walls; and they spoil the lines of the building. Ruskin himself thought so, strongly disliking these "incoherent fillings," and, after his own extreme manner, he for this reason said very little about Westminster Abbey in his writings. If anyone wishes to see the difference between a building filled with inappropriate monuments and statuary and a building where the choice of material has been better considered, producing a more harmonious result, he has only to visit the Abbey and then to go on to St. Paul's Cathedral, for, whatever may be said of individual monuments in the latter building, the total effect is much better than that at Westminster. Mr. Sydney C. Cockerell suggests that the most suitable memorial to Ruskin would be the purchase of a beautiful cliff or hill-top, secure against the encroachments of the jerry builder. "The chain once broken memorials of this kind might become the fashion, and, greatly to the public gain, might take the place of the costly modern tombs and discordant windows at which we are so often made to shudder." As the dead master thought these were the most complete and special ways of wasting money, and that "respect for the dead is not really shown by laying great stones on them to tell us where they are laid, but by remembering where they are laid without a stone to help us," Mr. Cockerell's suggestion, or something like it, is a good one in this particular case, though we have not any wholesale objection to all monuments; rather we favour them, provided they are worthy and are in perfect harmony with their surroundings. But, putting this question aside, we certainly disagree with the proposal for erecting a memorial to Ruskin which would be in absolute contradiction to the principles he held and in a building already spoiled to him by such erections.

The Joyners' Seal.

AFTER a succession of curious adventures the seal of the Joyners', or Joiners' Company has once more passed into the possession of its rightful owners. There seems to be a spice of frivolity in the composition of this emblem which leads it to disappear from the circle of its friends for protracted holidays. The one that has just ended began in 1819, and has therefore lasted eighty-one years, and there is reason to believe that the seal has had other vacations of a similar nature before that date, since it was first manufactured in 1571. We would recommend the Livery and Court to closely attend its future comings and goings. Possibly the seal's return has accomplished some benefit by directing attention to the Joiners' Company and its work. We suppose that comparatively few persons were aware (before the little paragraphs anent the seal appeared last week in the daily press) of the existence of this City Company, though the Carpenters' Company has long been known for its philanthropic work in the matter of technical education. Needless to say, its old powers of controlling the trade have departed, and the Master and Wardens no longer condemn and seize all specimens of bad workmanship. We could wish that the powers that lapsed in 1747 were in force to-day. But the fact that these arbitrary powers have been set aside does not deter the Company from doing useful work, and in conjunction with the Carpenters' Company it has done much good by providing classes and examinations for the benefit of young apprentices to the trade. Carving has been a principal branch of its teaching, and the Company purpose celebrating the return of the prodigal seal by offering a medal and prizes for carving at the Exhibition in June next year, particulars of which will be found on another page.

London's Latest Idea.

FROM time to time Londoners are startled by the projection of gigantic schemes to relieve the congestion of their crowded streets. Sir John Wolfe Barry, whose paper was read at the Society of Arts last November, advocated the cutting of a wide street from east to west, with all the principal north-to-south streets bridged over or tunnelled under it, in order to avoid the unending block system that now prevails. The advent of the City and South London, the Waterloo and City and the Central London Railways has suggested indefinite possibilities for relieving the difficulties of crossing London, and a great deal more may be done in this direction. In fact, if the scheme of Messrs. Smith and Fox (see page 79) were put forward in the interests of the passenger traffic we think a great deal might be said for it. But these engineers include market produce in their calculations, and consequently we are not so ready to follow them. The bulk of the market traffic takes place in the early hours of the morning, when the street traffic is lightest, and the markets are over before the day traffic has commenced. The bulk of the vegetable produce is loaded from the field direct into the carts, and it is thus cheaper to send by road than rail. Further the congestion, if any, in the market traffic is due to the carts of the retailers, and no system of railways, however good, can obviate this difficulty. As matters stand now a wholesale merchant can choose his own hour to place his goods on the market, but if he is to be subject to the delays or exigencies of railway traffic he may only get his goods delivered as the market closes, and will thus be a heavy loser. If the idea were carried out, the siding accommodation to be adequate would be simply colossal, and would undermine London to a dangerous extent. Besides, the promoters of the scheme do not seem very clear as to the composition of the traffic that passes through the streets. The Strand Board of Works took a census of the vehicular traffic in the Strand by Wellington Street in 1890, and found that from 6 a.m. to midnight 14,924 vehicles passed the fixed point, travelling east and west. Out of the above total, 11,831 vehicles consisted of cabs, omnibuses, carriages, cycles, &c.—that is, vehicles used for the purposes of travel. Only the remaining 3,093 were carts or vans for the carriage of goods. Since this census, omnibus traffic alone had increased 40 per cent. by the year 1893. Thus we see that the congestion is due to the vehicles conveying passengers, and any scheme that will diminish the number of omnibuses, cabs, and trams is greatly to be welcomed. But while the new scheme is loaded with the market-produce idea we fear it will never receive the support which it otherwise deserves.

HADDON HALL: SOUTH FRONT FROM THE TERRACE.

HADDON HALL.

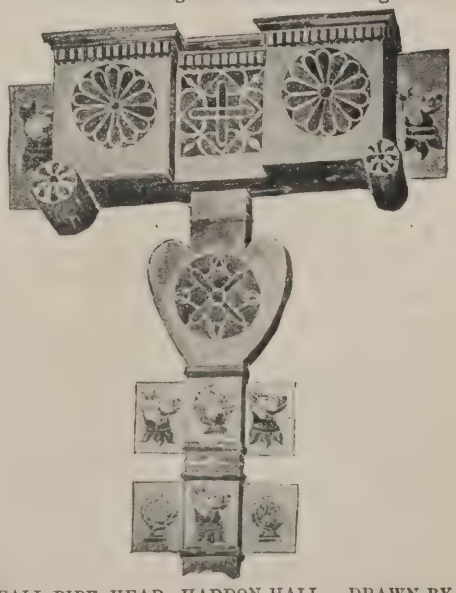
BY ARTHUR J. PENTY.

FEW of the old halls of England have the attractions of Haddon, few can boast of more remote antiquity, and fewer still the same beauty. Its memory has long been cherished in the hearts of the antiquary, the painter and the architect, and it stands almost unparalleled as an example of English mediæval architecture.

Haddon stands on a natural elevated platform on the eastern bank of the Wye. It is approached from the main road between Bakewell and Rowsley by a drive which crosses a very elegant and venerable old bridge, passing over which we are immediately in front of the charming cottage which is the lodge of the custodian. In the garden of this cottage we make our first acquaintance with the boar's head and the peacock—the crests of the houses of Vernon and Manners—shaped in the growing yew trees.

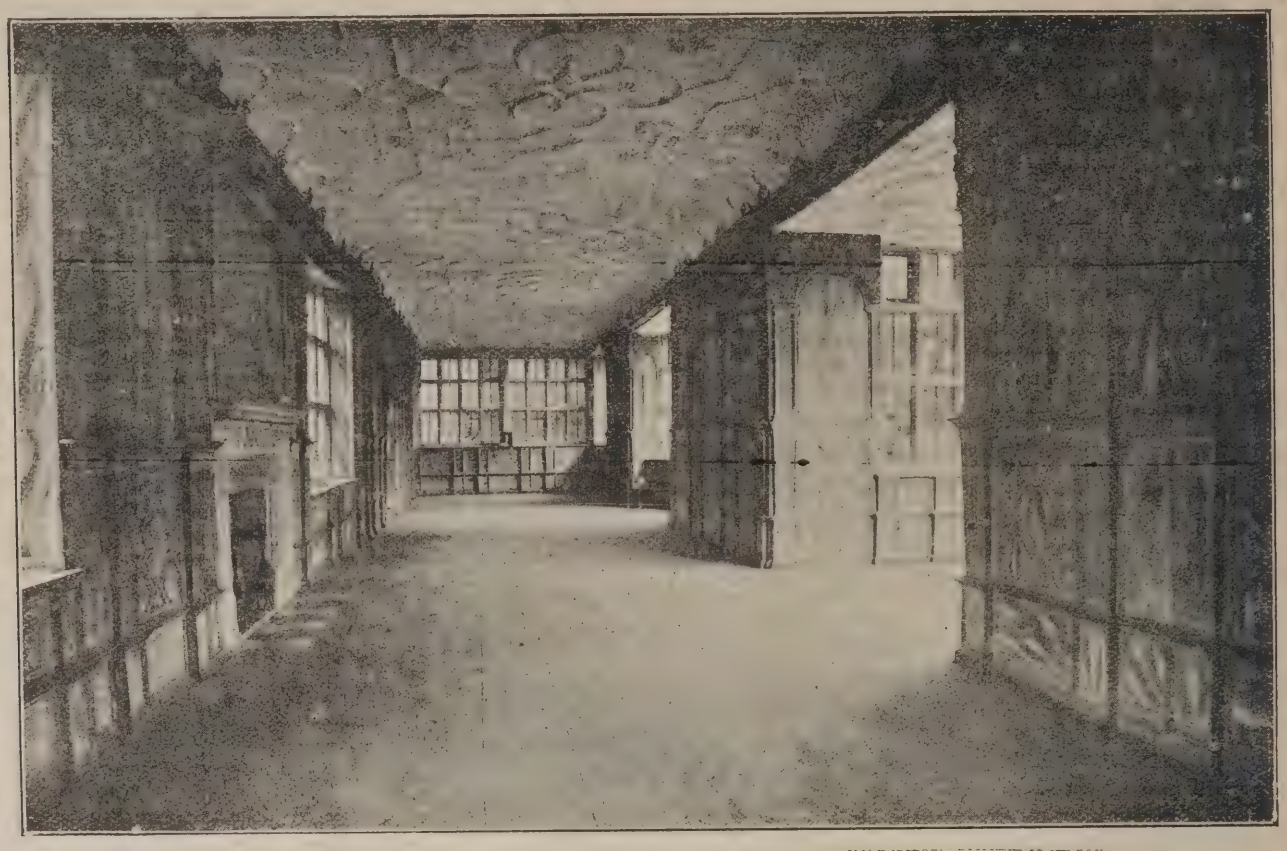
In many respects Haddon bears a close resemblance to other English mediæval houses. The general plan is that of an oblong. The buildings are built round two irregular courtyards, the greater part of which is two storeys high. The earliest of the existing portions are undoubtedly of Norman origin, and it is not improbable that they were grafted on a Saxon erection. Additions were made from time to time until 1624, when the building was completed. The ancient workmen, when making additions, appear to have removed only so much of their predecessors' work as was found to be in the way, and left the old and the new in untidy juxtaposition: for instance, there is an old circular staircase under the ball-room which stops short underneath the joists, and below the ante-rooms (opening out of the drawing-room) and ball-room there are many apartments which have been rendered useless by reason of later additions.

The entrance tower, of the late Perpendicular period, is very picturesque, though in detail rather clumsy. The feature, however, of the north front is the fine old fourteenth-century kitchen chimney-stack, which is undoubtedly the cleverest bit of work in the whole place. It consists of a complicated series of wonderful weatherings, little lights and irregularities which impress the beholder with their surpassing beauty.



The lower courtyard is the one which is usually entered by visitors first, and possesses a greater claim to architectural dignity than the upper courtyard. The very picturesque effect is enhanced by the ground, which rises rapidly from the north-west entrance. Immediately in front of us is the banqueting hall with its simple though rather coarse fourteenth-century windows; there is also an immense fireplace, the treatment of the chimney of which is not to be recommended. It does not explain its purpose in the same manner as the beautiful kitchen chimney-stack, but is hid behind the parapet. The south-west corner of the courtyard is occupied by the chapel, a building approaching the dignity of a church. It is of Perpendicular character, and contains some excellent seventeenth-century woodwork. Some fragments of stained glass and some remnants of mural decoration still exist.

Leaving the chapel the visitor notices a flight of stone steps leading from the lower courtyard to the State apartments. These were placed so that the family were able to attend the chapel services without passing through the hall.



The upper courtyard contains little of interest beyond the Eagle or Peveril tower and the bay window of the State bedroom. These together make a piece of well-proportioned work of good design. Upon entering the banqueting hall the visitor is reminded that the history of Haddon was one of hospitality by a little iron bracket with ring attached high above the level of the head. This, tradition says, was an instrument of punishment for enforcing the laws of conviviality. For it is said that if in the days of feasting and merriment in the "good old times" a man should fail to drink up his quota of liquor he was fastened up by the wrists to this ring and the liquor poured down his sleeve, so as gradually to trickle down him on to the floor; or if guilty of any breach of the laws of decorum at the board he was similarly tied up and compelled so to remain during the carousal, and was not only treated now and then with a stream of cold water poured down his sleeve, but other indignities were also forced upon him. The interest and beauty of this hall are of a very high order. The oak screen across the north end, which forms the front of the minstrels' gallery, is beautifully panelled, each panel being headed with cusping, above which there is other Gothic tracery of elegant design. A ponderous oak table here is worth attention.

Passing out of the banqueting hall the visitor next enters the dining-room. The top panels of the wainscoting of this room contain a succession of shields bearing different arms, together with the crests of Vernon and Manners. The little recessed bay forms one of the most comfortable retirements imaginable. The windows are filled with glass disposed in an elaborate geometric pattern. Some of the lights contain shields in stained glass displaying the arms of Vernon and quarterings with the Avenalls, Pypes, &c. The ceiling is divided into compartments by transverse beams and has been elaborately painted and decorated. It is one of the most charming and certainly one of the most interesting apartments in the whole building.

Above the dining-room is the drawing-room.

FALL-PIPE HEAD, HADDON HALL. DRAWN BY ARTHUR J. PENTY.

THE BALL ROOM, HADDON HALL.

The character of this room is much the same as that of the dining-room. The carpenters of the period were satisfied with simple panelling of exquisite proportions and delicate mouldings. Many of the panels in this room were originally painted and gilded, portions of which still remain. Three rooms opening out of this are chiefly interesting on account of their tapestry.

Across the landing is the long gallery now called the ball room. This is essentially an Elizabethan apartment. The room is 109ft. 6in. long by 18ft. wide, and contains three fine bays, one square and two canted. Nearly the whole of the end is occupied by one large window. The walls are lined entirely with oak and unfortunately elaborated with inferior taste. The richly ornamented ceiling is more successful. The general effect of this room can hardly be surpassed in domestic architecture, although its detail cannot be recommended. From near the upper end of the room a richly ornamented doorway opens into the ante-room or lord's parlour, which two centuries ago was designated the Orange Parlour. It is a small room hung with paintings, and around part of its walls is a cornice embellished with the crests of Vernon and Manners. The interest, however, attached to this apartment rests in the strongly barred door which opens from it on to a flight of stone steps leading down to the terrace and winter garden. This doorway is known far and wide as Dorothy Vernon's door. It is said that through this doorway Dorothy Vernon made her escape when eloping with Sir John Manners, the hand of Dorothy Vernon eventually carrying with it the broad lands of Haddon to the family of Manners, who are not likely to forget the memory of their beautiful though wilful ancestress.

Passing through the ante-room the visitor enters the State bedroom with its beautiful old State bed, draped in green silk and velvet and white satin, exquisitely embroidered and enriched with needlework. The elaborate plaster panel over the chimney-piece, representing Orpheus and the beasts, is worthy of attention. In the window of the bay stands an antique dressing table and a grand old looking-glass. These deserve a careful examination. Beyond this room are the upper range of rooms forming the north front. These are chiefly interesting on account of their panelling, tapestry and furniture.

Returning to the ante-room and through Dorothy Vernon's door we find ourselves on the terrace. The south front, as seen from here, is a view to revel in and not to be forgotten. Everyone will appreciate the telling effect which the series of bays and oriels produces. The south front and the terrace are the glories of Haddon. The latter extends the full width of the upper garden. There a striking effect is obtained by a simple treatment of different levels. Much of the charm of Haddon may be attributed to this simplicity of treatment. The ancient builders never strove after effect, but took advantage of the suggestions offered by their site, and seized upon the opportunities of design in making their building faithfully fulfil its purpose. The garden is an example on a small scale of the charming formal gardens that were once scattered over England. Fortunately, it remains unaltered. The winter garden of the terrace is planted with yew trees many centuries old. Altogether it is one of the most delightful outdoor bits which the artist loves to paint; yet it has not become so familiar as to lose its interest.

In the days when Haddon was built there was a thoroughness of workmanship which is unfortunately often lacking to-day. This is illustrated by the care which was given to minor details. The great variety and beauty of the fall-pipe heads, leaded lights, hinges, casement fasteners, fire-grates and dogs and other metal work indicate a living art. These are characteristic for good design, simplicity in outline and purity in style; they are devoid of any attempt to dazzle or attract attention.

But Haddon has other and broader claims as a monument of architecture. To-day it is seen as it was left by the mediæval builders—undamaged by fire and uninjured by restoration. The history of Haddon, unlike that of most of our ancient baronial halls, was one of peace and hospitality, not of war, feud and oppression. Time has given it that rich harmonious yet sober colouring, as precious as it is impossible to gain without it. No repairs have been done except what were absolutely necessary, hence such a perfect specimen of mediæval art. Another characteristic feature is the great harmony and the unity of effect which prevails, notwithstanding that the buildings were erected and altered during an extended period. The living force of English tradition is accountable for this. The old builders showed a steadfastness of purpose by treating their buildings naturally, each feature explaining the function it fulfilled. Reserve in design was exercised by refusing to use anything for the mere sake of novelty and by employing simplicity in preference to obtrusiveness.

Haddon stands in striking contrast to the commonplaceness and ugliness to which we have accustomed our eyes. It is an environment in which the artist loves to work. It uplifts the architect with its thoroughness, making him regret the day when amateur fancy was substituted for craftsmanship which cut us adrift from the true soul of art and eventually extinguished tradition. We realise to-day how much we have lost when we compare the conditions under which those craftsmen worked with those of the modern builder. The technique has to-day been exalted at the expense of the artistic. Our national architecture cannot improve so long as this continues. The numberless little things over which the architect has no control will never be properly done if the craftsman has neither artistic taste nor the guidance of a tradition. To make every workman artistic is impossible, yet with the help of tradition he always produced work which did not offend.

But, alas! how many visit Haddon, and how few appreciate it. The average Englishman looks for comfort alone in his dwelling, and departs with the idea that, since Haddon's domestic arrangements are out of date so is its beauty. Commercialism to-day has supplanted art, and he leaves it, as Horace Walpole wrote: "An abandoned old castle of the Rutlands."

A Memorial at St. Patrick's, Wapping, is to be placed in the presbytery to the memory of deceased boys of the school attached to the church. The work has been entrusted to Mr. Henry Price, sculptor, of Chelsea, and will consist of a bronze relief with two schoolboys modelled on either side representing Reading and Writing, supported by figures of Grief. The names of the boys are to be cut on a block of Carrara marble, and the whole to be mounted on a slab of Connemara marble, placed in a conspicuous part of the church facing the high altar.

WORKS IN WOOD.

PRIZES OFFERED FOR CARPENTRY, CARVING, AND MODELS OF HOUSES.

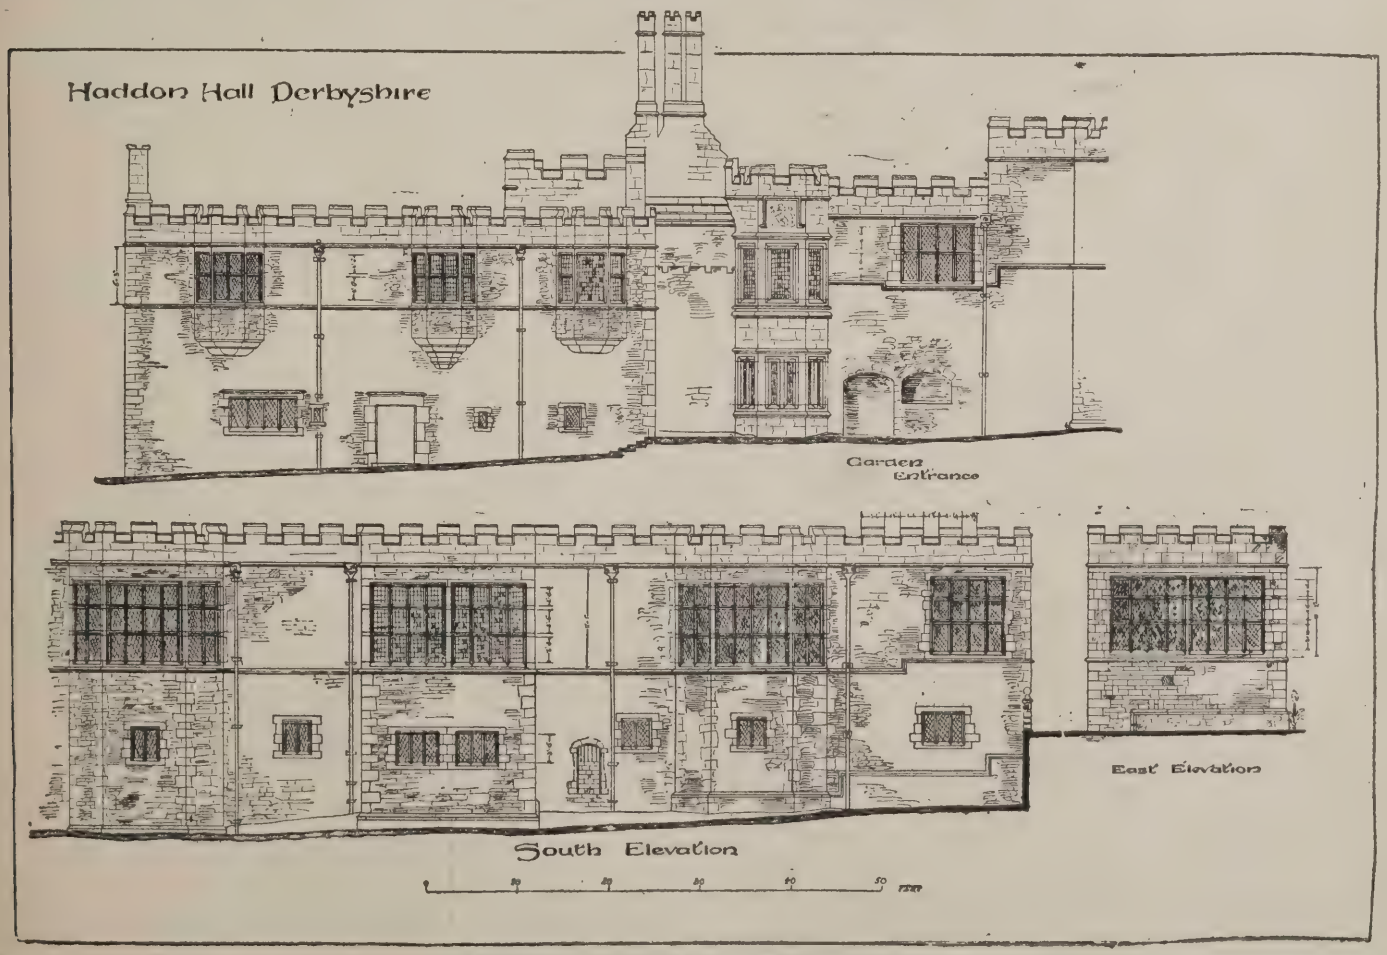
AN exhibition of models and specimens of works in wood will be held in June next at the Carpenters' Hall, London Wall, under the auspices of the Carpenters' Company and the Joiners' Company. Prizes are offered for constructive carpentry in which skill in obtaining the greatest amount of strength at the smallest expense of material and labour shall be the object (this section includes roofs, bridges, centering, shoring, gantries, &c.); ornamental carpentry in which skill in obtaining architectural or picturesque effect, combined with strength and economy in material and labour, shall be the object; models or specimens of hand-made joinery; cabinet work; carving (including friezes, panels, capitals, &c.); and models of the following houses, built chiefly of wood:—

A detached labourer's cottage of one storey (first prize £4, second prize £3); a detached labourer's cottage, two storeys high (first prize £4, second prize £3); a small dwelling-house fit for a head gardener or farm bailiff to occupy (first prize £5, second prize £3). Gold and silver medals of the Carpenters' Company are also offered for plans of cottages, one or two storeys high, including working drawings, specifications, and approximate estimate, with or without perspective sketch; drawings to a scale of ¼in. to a foot, with constructive details to a larger scale.

The models are to be constructed to a scale not less than ⅛in. to the foot, or more than ¾in. to the foot. The roof must be capable of being taken off, and if there are two storeys the upper floor must also be removable; fittings such as a dresser or press are to be shown, but not furniture. In all cases there must be a dwarf wall for a foundation not less than 6in. above ground-level, and the fireplaces and chimneys must be in brick or stone. Above the dwarf wall half-timbered or wholly timbered work must be mainly employed. The chief objections raised against houses of wood are (1) danger of fire, (2) liability to harbour vermin (insects), (3) the expense of painting. The attention of competitors is drawn to these, so that they may make provision or suggestions for overcoming them. The main objects are health and economy, but it is desired that the buildings, though simple, shall have a pleasing appearance. They are not for town buildings, but might be erected in country places, and where timber is plentiful. It may be assumed that the water supply will be from a well, and that it is of importance to store rain-water to a moderate extent.

The different objects for competition must be delivered at the Carpenters' Hall during the week ending May 11th next. Further particulars can be obtained from S. W. Preston, Esq., Carpenters' Hall, London Wall, E.C.

BRIGHTON AQUARIUM.



DECISION TO INVITE COMPETITIVE DESIGNS.

ON page 34 of our issue for August 15th some particulars were given of the proposals in connection with the Brighton Aquarium. The matter was before the Town Council some weeks ago, when it was referred back to the General Purposes Committee, principally with the object that swimming and other baths might be included in the plan. This was done, and at the last meeting the scheme in its entirety was brought up. The result was that the main details—the winter garden and concert room, the baths, and the improved terrace—were approved. On the question of the widening of the Marine Parade there was considerable divergence of opinion, but in the end it became evident that the majority of the Council considered the borough surveyor's plans provided for a too extensive widening, and a good deal of talk ended in an amendment to the effect that the pathway should be widened only at the west end. With the proposal to run a tramway from the Aquarium entrance to the east end of the Kemp Town terrace the Council refused to have anything whatever to do.

Alderman Clark moved that competitive designs should be invited for the adaptation and alteration of the buildings, and that premiums of £250, £150, and £100 should be offered for the best three designs.

Councillor Carden moved as an amendment the following proposition, of which he had given notice:—"That before the Council advertise for competitive designs for dealing with the Aquarium, an architect of standing be engaged to prepare a report with plans as to the utilisation of the existing buildings, together with rough estimate of the cost, and that after this report has been submitted to the Council the architect be retained to draw up the terms of conditions upon which competitive designs be invited, and that such architect be retained as assessor to assist the Council in adjudicating upon the designs submitted. The architect's fees not to exceed 200 guineas." He pointed out that nothing was said about cost in the proposal to invite designs, so that they would have schemes sent in based on totally different figures, and there could be no comparison between them. The right thing to do was to call in some competent architect to confer with the General Purposes Committee, go over the buildings, and advise what was the best course to adopt. He could prepare a set of rough designs, and then when the Council had decided how much they would spend they could invite competitive designs. The rough plans would be sufficient to go with the Bill before Parliament, and they could have the competitive designs ready to go before committee. Alderman Sir John Blaker seconded. Councillor Wilson pointed out that Councillor Carden's plan limited them in their choice of designs for dealing with the Aquarium, because the architect who made the sketch plan would naturally expect to be engaged to prepare the final plans. Councillor Carden therefore added the words "and that such assessor be not employed to carry out the work after such a competition." The amendment was put and carried.

Queen Elizabeth's Lodge in Epping Forest has just suffered extensive restoration by the City Corporation. A considerable sum of money has been spent in removing some of the work which concealed the original attractions of the ancient place. The upper floors are used for the purpose of a museum in connection with the Essex Field Club.

MEASURED AND DRAWN BY ARTHUR J. PENTY

Law Cases.

Dispute between Builder and Architect.—The case of *Charles* v. *Palethorpe and Dunn* was recently heard at the Birmingham Summer Assizes before Mr. Justice Wills and a jury. The plaintiff, a builder and contractor, sued the defendant Palethorpe for £581 due upon building works erected by him, and he also claimed damages against a Birmingham architect named Mr. J. G. Dunn for improperly withholding his certificate upon the contract. The defendant Palethorpe counter-claimed for penalty for delay, and for the work being improperly done. Mr. Palethorpe, it seems, declined to pay over a balance of about £600 due on a contract of more than £3,000 for the erection of new works, because the architect would not give his final certificate. With reference to the delay, the plaintiff declared this was occasioned by 700yds. of additional excavations, which meant a month's or five weeks' work. Then there were a lot of "extras," and considerable delay was caused by sub-contractors not under his control. The plaintiff was cross-examined at considerable length, but would not accept the suggestion that Mr. Dunn had great difficulty in keeping him to his contract. He admitted making excavations involving a considerable amount of extra brickwork, the cost of which Mr. Dunn would not allow because he considered the work unnecessary. The plaintiff was convinced it was necessary, but under the contract a question of that kind had to be decided by the architect. He did not accuse Mr. Dunn of fraud in disallowing that. Mr. Dunn had charged him with having built certain piers with mortar instead of cement as provided in the contract, and had taken something off his claim on that account. That was a serious charge against him of trying to scamp the work, and he denied its truth, though he admitted that in some instances his workmen inadvertently used mortar instead of cement. Mr. S. Lowcock, civil engineer, who was employed to test the strength of the piers, thought four ought to come down. It was not true that bad bricks and slates were used in the building. At the conclusion of the case for the plaintiff, his Lordship asked the jury whether they thought any case of fraud had been made out, as had been suggested by plaintiff in his pleadings. The jury replied in the negative. His Lordship: Any ghost of a case of fraud? The Jury: We do not think so, my lord. His Lordship: That will be a verdict for the defendants on the claim.—With reference to the counter-claim, counsel on both sides conferred together, and eventually the parties agreed to the following terms:—Judgment for the defendant (Mr. Palethorpe) on the claim with costs, and judgment for Mr. Charles on the counter-claim, but with the condition that Mr. Palethorpe should relinquish two-ninths of his costs on the claim. With regard to Mr. Dunn, judgment was to be for him with costs. His Lordship agreed to the arrangement.

Fined for not Erecting Hoardings—Thomas Wilkinson and Sons, builders and contractors, of Gleadless Road, Heeley, were summoned recently at the Sheffield Police Court for a breach of the Corporation building by-laws in failing to erect hoardings in front of houses in course of erection in Eccleshall Road. They were fined 20s. on July 20th in connection with the same buildings. It was stated for the defendants that the week subsequent to the date of the order to erect hoardings had been very wet, and work had been impossible. The magistrates imposed a fine of £2, including costs, remarking that it was in their power to inflict a fine of £5, with an additional £2 for every day after the first week had elapsed in which their previous order had not been complied with.

City Building Schemes: An Instructive Case.—At the recent Summer Assizes at Birmingham the case of *Crouch* v. *Roberts* was heard before Mr. Justice Wills and a jury. The plaintiff, a builder, brought an action against the defendant, an estate agent, in connection with an agreement under which the defendant undertook to indemnify the plaintiff against any expenses he might be called upon to bear in respect of certain mortgages and leases. The case arose out of one of those building schemes by which many gentlemen in the city had made large sums. Somebody usually came short of their money—usually the people who supplied the material—or the builder failed: but the master mind who had conceived the scheme belonged to the gentleman who made the money. He covered his land with buildings at no cost to himself, and he had a number of ground-rents which fetched a large price. In this case, said counsel, Crouch was the unfortunate builder, and Roberts was the gentleman who possessed the master mind. In 1896 Roberts became the freeholder of a tract of land at Selly Oak, and on April 17th of that year he entered into a contract with Crouch for the erection of 84 front houses and 22 terrace houses, for the sum of £11,650. In the following July Roberts informed Crouch that he had so many things on hand that he could not afford to find any more money on this particular contract, and what plaintiff's counsel described as a rather curious scheme was agreed to. The original contract was to be dropped, and Roberts, as freeholder, was to grant leases of various plots of the building estate to Crouch, who was to apply for progressive mortgages on these leases. As the buildings proceeded it was arranged that Roberts himself was to give the certificates on which money might safely be advanced to Crouch. Crouch was not to find any capital, and Roberts was to pay him for all the labour and material. The money was to be obtained in this way. Roberts said he would be able to negotiate for the advances of £100 on each house, which Crouch would have, and for the balance he would sell the leases, when the houses were completed, subject to the mortgage. Out of the moneys received from the sale of these equities of redemption, Roberts said he would repay Crouch the money he had spent in building the houses over and above the £100 which was to be obtained upon them on mortgage. It was further arranged that when the buildings were completed and sold Roberts would pay Crouch £1,000. A written document was drawn up, which showed clearly that although nominally these leases were to be in Crouch's name, and although in the mortgages he was to be the person pledging the property and receiving the money, yet as a matter of fact, as between the parties, it was Roberts alone who was to be the owner of everything. In return, Crouch got an indemnity by which Roberts undertook that Crouch would be under no liability for any expense incurred in the matter. But Crouch was spending far more money upon this property than he got either from the mortgages or the sales of the equities of redemption. He got a great deal of material upon credit, and was running into debt. He accordingly pressed Roberts for money, and the latter suggested that he had better raise a second mortgage on some of the houses. Crouch accordingly did so, and every penny of it (£350) was spent by Crouch on the property, though the defendant now alleged that the £350 was not money advanced under the scheme, and had not been spent upon the property. This second mortgage was called in, a writ was issued, and judgment obtained against Crouch. After a time Crouch got together £125, and in consideration of this payment on account was able to get rid of the sheriff. But there was still this judgment hanging over his head for the balance. Crouch had paid for material for these properties out of his own money £1,600, and in addition he had incurred liabilities to persons in the building trade to the extent of another £1,600, so that altogether Roberts, by his connection with Crouch, had benefited to the tune of about £3,000. But the only questions for the jury were whether the agreement was binding upon Roberts and whether the second mortgage was one in connection with which Roberts agreed to indemnify Crouch from all liability. The defendant denied the agreement, and alleged that the original contract was still in existence, and that the plaintiff had not carried it out, and that he had suffered damages which were put down at £1,250. His Lordship, in summing up, put two questions to the jury—Whether there was a rescission of the original contract, and whether the indemnity contract was to apply to the second mortgage as well as to the first or progressive mortgages. The jury answered both questions in the affirmative, and plaintiff's counsel was granted a declaration of indemnity. As to the counter-claim the jury accepted Crouch's version, namely, that the basis of remuneration should be cost, plus £1,000, £100 per house on a mortgage, the proceeds of the equities of redemption, and any advances made by Roberts to be taken on account in final settlement.

Lowering Footways: Successful Claim against an U.D.C.—Mr. Justice Bucknill recently heard at the Birmingham Summer Assizes the case of *Sheldon* v. *Rowley Regis Urban District Council*. The plaintiff, who is the lessee of the Phœnix Brickworks, Tividale, sought to recover damages for injury done to his buildings through the negligence of the defendant Council, of which he is a member. Plaintiff's buildings, which consisted of a cottage and half-a-dozen brick-drying stoves, were said to have been underpinned in a defective manner by the Council when that authority lowered the footway in front, but the defendants contended that the cracks seen in the walls of the buildings were the result of a general subsidence in the neighbourhood, due to intermittent pumping. Mr. Whittaker, a builder in the district, deposed that he found several places in the cottage where the mortar had been chipped off to make the cracks appear new. Others—including Jim Cook, the Council's drain inspector (whose florid countenance caused his Lordship to remark that his occupation seemed to suit his health)—gave evidence to the effect that the subsidence was due to general operations in the district, and that the plaintiff's buildings had been out of the perpendicular for a long time past. His Lordship, summing up, said the workman who did the underpinning on behalf of the Council was to some extent on his trial, and, of course, he added ironically, they had never heard of work being scamped. The jury found a verdict for the plaintiff for the full amount claimed—£138.

BUILDING TRADES' GIFT TO THE NATION.

MR. EDWIN O. SACHS, Chairman of the Executive of the Building Trades' Gift to the Nation, has much pleasure in announcing the following further list of contributions:—

	£	s.	d.
The Birmingham Master Builders' Association (first instalment) (per Mr. W. Sapcote)	200	0	0
Workmen of Messrs. Perry & Co. ..	33	2	7
Mr. Paul Rhodes (Leeds)	9	14	6
Messrs. S. Goodall and Son	5	5	0
Workmen of Messrs. T. and W. Ide (per Mr. J. McMullon)	5	1	0
Workmen of Messrs. Perry and Co. ..	4	8	11
Employees of Messrs. S. Goodall and Son	4	8	0
Messrs. Harrison and Spooner and workmen	3	18	0
Workmen of Messrs. Batley, Sons and Holness	2	16	10
Mr. John Radford and fellow workmen	2	16	0
Mr. J. F. Collinson and workmen (Teddington)	2	12	0
Mr. Henry Child and workmen	2	8	1
Workmen of Messrs. Matthew Brothers (per Mr. J. H. Perkins)..	2	7	6
Workmen of Mr. A. Bothwell	2	2	0
Employees of Messrs. Lancaster and Co.	2	2	0
Mr. S. Spencer and workmen	2	2	0
Messrs. F. Nicholls and Son	1	8	0
Mr. W. H. Quarterman and workmen ..	1	7	6
Workmen of Messrs. Brown and Sweetland (New Southgate)	1	5	6
The Cadogan Ironworks and men ..	1	5	0
Employees of Mr. W. Banks	1	0	0
Mr. Wishey and employees (per Mr. J. M. Hillam)	1	0	0
Mr. J. McLean (Canada)	1	0	0
Mrs. McLean (Canada)	1	0	0
Mr. Arthur Webb and workmen (Stratford)	0	17	0
Workmen of Mr. J. W. Heeps	0	7	0
Mr. W. A. Osborn	0	5	0
Workmen of Mr. T. Jones (Putney) ..	0	4	0
Workmen of Mr. E. Haydn (Ryde) ..	0	3	6

A Memorial Window at Crowhurst Parish Church has been dedicated. The three-light window is placed in the recess on the right of the chancel looking west. It was erected by Messrs. Heaton, Butler and Bayne, of London.

Correspondence.

Stockport Union: New Infirmary.

To the Editor of THE BUILDERS' JOURNAL.

SOUTH SHIELDS.

SIR,—Absence from home has prevented me from at once seeing your issue for August 8th, in which you published a report of the Committee of the above Union. You state that Messrs. Newcombe, Morton and Knowles, architects of the Gateshead Workhouse, are to be invited to compete amongst others for the new infirmary. I beg to state that the Gateshead Workhouse and Infirmary was executed from the designs of Mr. J. H. Morton, F.R.I.B.A., of South Shields, in conjunction with Mr. W. L. Newcombe, of Newcastle, and Mr. W. H. Knowles, of Gateshead. As your notice has caused some confusion I shall be glad if you will insert this correction.—Yours truly, R. H. MORTON.

Mafeking Church.

To the Editor of THE BUILDERS' JOURNAL.

ILE L'OUESSANT, FINISTÈRE.

SIR,—In your issue for August 8th is a note about the above now historical edifice. It was built, not many years ago, almost solely at the expense of the Bechuanaland Mounted Police, whose headquarters are at Mafeking, and, as churches go in South Africa, was not at all a bad looking little place, of Early English character. But, even at the time of my somewhat lengthened visit, two summers ago, it was not nearly large enough for its necessities. The old rectory was one of the earliest in that part of the country; but within the last few years a new one, of wood and iron, has been erected. It stood betwixt and between the east end of the church (dedicated to St. John) and the Boer lines on the eastern side of the town (if so small a village as Mafeking, looked at from English eyes, may be called a town at all), and therefore suffered from the shells of the beleaguerers. The Rev. W. Hayes Weekes, M.A., the gallant rector, has also another little church situated in the compound just outside, in the midst of the native residents, who outnumber the whites by something like ten to one. This little church (which does duty as a native school during the week) is dedicated to the Good Shepherd, and is built of sun-dried bricks, made of a sort of "cob," each brick being about 2ft. by 1ft. by 1ft. After being laid the walls are plastered over with a thin wash of the mixture the bricks are made of, and thus cement covered.

An excellent opportunity now exists for the erection of a really good church, as money will soon begin to come in freely. The South African ecclesiastical buildings generally are of such poor design that something more in accordance with English ideas is very desirable. I may add that the rector (he stands 6ft. 3½in. in his socks!) does not propose to return to his charge until the end of the present year, so that no doubt full opportunity will be afforded for procuring a really good design from some competent architect in England.

Yours truly,
HARRY HEMS.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, S.W.

SIR,—Why are architects so badly paid, and consequently their assistants? The educated public takes no interest in, and has no appreciation for, the work done by the architects of the last three centuries, and the whole reason is that the works of the Italian Renaissance and all that followed were insincere or copied, and therefore lacking architectural interest. It is safe to assert that no architectural work in the past was produced by an "architect," using the word in its present sense as a mere designer on paper. The producer of architecture in the past was always the builder, always the master workman, an artist-tradesman. And the architects' assistants are part of the pernicious system now in vogue. As a preserve for the sons of men with wealth—small though that may be—the profession is a false one, though perhaps its members may not see it in this light. As the proverb says: "A man may be a fool without knowing it."

Again, compare the large payments received by our painters and sculptors, men whose works are of interest, with the miserable payments made to those attempting to produce architecture. The money once spent in obtaining an art work in building is now mostly diverted into other branches of art. We have seen recently furniture and jewellery return into popular appreciation, and it is reasonable to expect the same in regard to architecture, only firstly that will have to be produced.

I am pleased to see the small pittance which the "architectural assistants" are receiving everywhere. May they at last be driven to take up some craft and work at it and become actual builders. The comparison of the assistant's salary with that of the artisan (I use this word advisedly, both being working men) and the false pride in regard to hand labour is contemptible. The assistants do not deserve more; they are no use for producing architecture; they may help in draughtsmanship, but not in building, and architecture is not a thing apart to be added as required. A building can be refined—i.e., become imbued with art—and then rise to be called architecture. Yours faithfully,

UNTRAMMELLED.

HINTS ABOUT THE USE OF PORTLAND CEMENT.

WHEN using Portland cement for foundations in concrete it should be remembered that the best made and best laid concrete will subside and crack unless the bottom be firm and the foundation sound. Upon soft ground, where it is necessary to dig down a considerable depth in order to secure a hard bottom for foundations, a great saving of concrete may be effected by forming concrete piers beneath the points of the greatest weight, placed at distances from one another not exceeding 8ft. Concrete lintels should then be placed across the spaces between the tops of the piers. These lintels should have widths equal to the width of the ordinary foundation under footings, the depths varying with the weight to be carried. The insertion of small steel or iron joists within the lintels adds very considerably to their strength. The concrete should be composed of one measure of Portland cement to six measures of ballast. Allowance must be made for any settlement of the bottom or any subsidence, contraction or expansion of a concrete foundation. Fine concrete is more liable to contraction or expansion than rough concrete, but is not so liable to subsidence. It will, however, take longer in setting than rough concrete. When laying concrete in a trench it is always best to stretch a line from one end to the other and drive stakes into the ground, allowing them to project sufficiently to permit the concrete to be levelled to them; this will save material and labour.

A concrete footing is just as good as brickwork or the best masonry to bring the work up to the surface under ordinary circumstances, but in the case of piers subject to vibration brickwork is decidedly preferable. Foundations of concrete intended to be covered with paving should never be less than 6in. thick. For concrete walls the mixture should consist of two parts of sand, three parts of ballast which has passed through a round mesh 1½in. in diameter, and one part of Portland cement. When concrete is placed on a timber frame the latter should be made strong and rigid to prevent sagging. If the wall is to have an external face, the boarding used as moulds must be planed smooth, but if the wall is to be afterwards rendered this provision may not be necessary.

Courses of concrete should not be laid less than 6in. or more than 12in. at a time, the upper surface of each course being left rough to form a key for the succeeding course. A 12-inch concrete wall is of equal strength to a 1½ brick wall, though some municipal regulations require the concrete wall to be of the same thickness as the wall above. A concrete wall will conduct sound readily. Where concrete covers timber the latter should be well welted before being covered with the mass.

Builders' Notes.

Furniture at the Paris Exhibition.—Waring and Gillow, Limited, have obtained a double "Grand Prix" for furniture and decoration at the Paris Exhibition. This is the first time that the double honour has ever been conferred on an English firm.

Workmen's Dwellings at Morpeth.—With the view of helping to provide houses suitable for working men in Morpeth, the Middle Greens, a piece of market garden ground belonging to the Corporation, was sold for £1,270 10s. last week, subject to such conditions as would secure that no other class of houses could be erected thereon.

Bricks from Plate-glass Refuse.—At the works of Pilkington Brothers, at St. Helens, a million and a half tons of the spent sand and glass resulting from the operation of grinding plate-glass has accumulated, and 1,200 tons are added weekly. Dr. Ormondy has discovered, after much research and experiment, a means of making from this refuse bricks which, it is stated, can be used for building. The difficulty of getting a key for the mortar is one that will be considerable, and we await results from executed work.

To create efficient teachers of plumbing classes throughout the country advanced courses of instruction are carried on at King's College, London. A course is now in progress under the auspices of the Plumbers' Company and the Technical Instruction Committees for Lancashire, the West Riding of Yorkshire and Great Yarmouth. Instruction is given in the branches of physics and chemistry underlying the practice of plumbing, as well as in sanitation and advanced practical plumbing. The classes are held daily for a month in the workshops and laboratories equipped by the Plumbers' Company. The Saturdays throughout the course are devoted to visiting important plumbing and sanitary works in and around London.

A quarrel between the Salop County Council and the Atcham District Council is possible. The Technical Education Committee of the County Council has erected schools at Radbrook, within the Atcham district, without submitting plans as required by the District Council's by-laws, and a letter to the clerk of the Committee asking for plans has not been answered. The District Council's clerk is negotiating. In all probability the elaborate buildings at Radbrook comply with any and every requirement of the Atcham Council's by-laws, but if that Council has the power to require plans of all new buildings the County Technical Education Committee has omitted to perform a legal duty which they should be the last to neglect. Morally, however, the former authority has practically put itself out of court by allowing the matter to go on so long without interfering, the buildings being now practically complete.

Lead Poisoning.—A special meeting, attended by about 140 manufacturers of the china, earthenware, and allied trades, was held at Stoke last week to discuss the amended special rules proposed by the Home Secretary and the further amendments proposed by a joint committee of allied manufacturers, referred to in our issue of last week (page 57). Mr. Rawdon Smith, of Jackfield, Shropshire, who presided, said that, for a long time past the pottery trade had been at the mercy of many people not connected with the trade, but who had interfered simply for their own advertisement. The fritting of lead now proposed had been practised by some of the manufacturers for fifty years. In 1893 they had recommended the Home Office to specify a higher minimum for those employed in lead processes, but it was refused until 1898, when it was embodied. Periodical examination of all workers in lead had been proposed by the manufacturers, but not supported by the Home Office; and in many other items the manufacturers generally had been in advance of the Home Office. He felt they were all willing to do anything to lessen the dangers of the trade. Mr. Burton explained in detail the suggested

alterations to the amended rules that the committee had suggested on the previous day, the most important of which were the following:—The retention of raw lead in certain experiments and trials of a minor character in the hands of adults and in certain extreme cases for the glazes of pottery where lead is required in its most volatile form, and then under such reasonable regulations and restrictions as the Secretary of State may from time to time prescribe. The standard of solubility proposed by rule 2 to come into effect in 1902 was objected to, the committee suggesting that the whole question of solubility, instead of being settled now on insufficient information, should be deferred until the end of the period of two years as now mentioned, when both the manufacturers and the Home Office would have a large amount of practical information to go upon derived from the actual experience of English potters themselves. "Flat knocking" and "flint sifting" were processes in which under rule 10 the Home Secretary would require the introduction of fans, but they were strongly objected to, and they were to form one of the subjects of negotiation with the Home Secretary. Other alterations of a minor character were also suggested. The altered rules were adopted by the meeting. Mr. Burton and Major Moore were appointed a deputation to discuss with the Home Secretary and Dr. Thorpe the manufacturers' position as to the solubility of lead.

THE GLASGOW SCHOOL OF ART.

WE have received a copy of this year's prospectus of the Glasgow School of Art. As this school is an important one for architectural students—as may be judged from the fact that during the session 1899-1900, out of 776 students attending the school 115 were in the architectural division, this number only being exceeded by the 213 designers, draughtsmen and litho artists—it will be well to give a few particulars of the facilities offered for study. The classes that are of especial use to architectural students are those on geometry and perspective, drawing from the life and the antique, architecture, modelling, and design and decorative art. These classes are under well-known masters—Messrs. Alexander M'Gibbon, Walter R. Watson, Emmet Brady, Johan Keller, Alexander Walker, William G. Morton, A. Aston Nicholas, John Guthrie, Colin Kenmure and William Vickers. There is also a strong body of visitors to the classes. The architectural tuition of the school aims at (1) the preparation of students for an architectural career; (2) supplementing the office training of the pupil and assistant; (3) imparting an appreciation and knowledge of architectural form to painters, sculptors and workers in the decorative arts. The classes in design and decorative art are conducted in specially-erected studios, to enable students to learn design in and through the use of material. We strongly recommend all students of either architecture or of design and decorative art to take both courses, for no thoroughly good work will ever be done in the arts that relate to architecture unless the worker has some considerable knowledge of the sister arts. Architectural students learn the elements of construction; the nature of materials and the mechanics of architecture; draw from the cast; study the historical development of architecture in Europe; acquire a knowledge of the principles and growth of ornament; measure and sketch buildings; and receive instruction in architectural design. Concurrently with this, they study drawing and modelling from the antique and life, and attend, as far as possible, the lectures on ornamental design, anatomy and proportion, and figure design and decoration. The school contains a good collection of casts, and it is a commendable feature that these are shown in relation to the styles to which they belong, photographs showing the ornament or figure in its place in the building being given where possible. There is a good reference library and excursions are arranged to buildings for architectural study. There are a number of prizes and scholarships offered to students.

FROM MUD TO BRICK.

MUD, wood, stone—this was about the order in which man began to build his houses: mud because it was handiest and could be most easily worked or manipulated with the hands. How many ages mud shelters were the only habitations for man it is impossible to say. Structures of such a character would be swept away by the elements, leaving no trace behind. Here and there some sudden disaster overwhelmed a portion of the world, and in the ruins have come down to us more or less well-preserved specimens of mud huts, unquestionably the original shelters for human beings.

Next man made some progress. He developed some aptitude for toolmaking, and it became possible to cut down trees and fashion them into some sort of rude lumber, from which more substantial huts were built. The mud hut was liable to dissolve under prolonged precipitation. The wood hut was in danger from exactly the opposite cause. Its greatest enemy was fire. But while some were probably thus destroyed, a larger proportion was saved from any possible destruction and remained indefinitely the homes of the more or less civilised inhabitants.

But man was still progressing and the desire for permanency increased. Not alone did he want habitations which should be as permanent as the hills themselves, but he wanted to build monuments which should perpetuate his memory long after his perishable body had been dissolved into the original elements. He had also progressed in toolmaking, and was capable of fashioning tools which would work stone, though just what they were and how it was done is practically unknown, notwithstanding the innumerable learned essays which have been written upon the subject. All that is really certain is that man was able to work stone and hoist it to great heights, as instanced in the Pyramids of Egypt, built almost before the dawn of history.

For thousands of years wood and stone constituted the bulk of all the buildings erected and all the monuments ever put up. The larger and more elaborate structures were of marble, granite or sandstone, while the lesser and comparatively unimportant structures were of wood. Permanency was sought for in the stone, convenience and low cost in the wood. There appeared to be no method of united convenience of handling or structural manipulation which would permit a reduction of cost while retaining the same characteristics. Stone, to lend itself to the best effects, had to be in large blocks, and that increased cost, because the expense of moving from the original bed and all subsequent handling was made much larger by the great weight.

These structural problems became more serious as civilisation progressed, and it became more and more essential that permanency and cheapness must go together. While there is no historical account of the search for a satisfactory substitute for stone and wood which should combine the main characteristics of each, and yet be comparatively cheap, it is probably certain that such a search was continued through long years of unsuccessful experiments with various substances and combinations of substances, otherwise no adequate substitute would ever have been found. Though an idea may burst upon a genius in an instant, and from it may flow results that practically revolutionise the entire daily life of mankind, yet the sudden burst of light is but the culmination of long years of patient work on the part of numerous individuals.

The same thing occurred when some genius invented brick. The problem of the ages was solved in the completion of that idea. The people of the ancient world had the germ of the idea. But their bricks were baked in the sun and lacked the essential feature of permanency, because the continuous rains and the action of the winds wore them away. The Israelites partially overcame this objection by mixing them with straw, but even that did not accomplish what they undertook. It needed the application of fire, the burning process, to make brick absolutely permanent. When that was done the long search had been rewarded. The building material combining mobility with permanency had been completed, and henceforth architects and builders could construct buildings and monuments of whatever character they chose without the great expense of stone and with all the mobility with which wood could be used.

It is more nearly fireproof than any other material used. Marble melts in a fierce fire. Granite gets red hot, and when a stream of cold water strikes it it explodes with as strong a force as a blast of powder. Brick alone will stand both the fire and the water, and come out of the test as good as when it went in. In the case of recent destruction of brick buildings by fire it has been nearly always the steel frame which has buckled under the intense heat and the great weight, not the bricks themselves giving way.

In a way, then, man has returned to the methods of building adopted by his primitive ancestors. The modification is that modern man subjects his mud to intense heat to harden it and make it practically independent of the elements, while primitive man merely fashioned the blocks and placed them in his walls without trying to make them permanent. It is the return to a mobile substance, however, something which allows endless manipulation and which lends itself to delicate decorative processes and effects. J. K.

CONCRETE ROOFS.

IN discussing the question of roofs formed of concrete a writer who has given the matter no little consideration expresses the opinion that with a good base few roofs are more durable and effective than one made of concrete, finished with a layer of fine Portland cement and sand. The point is made, however, that the work should be kept damp and as cool as possible for several days at least, this being accomplished in a comparatively easy manner by covering it 2in. or 3in. deep with sand and wetting the sand from time to time with water from a spray hose or from an ordinary watering can.

Cracks in concrete roofs are frequently caused by the settling of the buildings, either from natural shrinkage or from defects in the foundations. When cracks do appear they should be filled with a fine mixture of Portland cement and sand. To counteract the expansion in roofs of this kind, compressible linings of wood strips should be used around the works where the flashings are usually placed, and a cement skirting or flashing 6in. high and 1in. thick should be well keyed into the walls with all concrete roofs; and this can be well done by raking out the mortar joints of the brickwork that is to be covered and wetting the whole before the cement is applied. No other flashing will be required.

Where a concrete roof is laid on between the rafters, the timber work should be made strong, and there should be ample wood fillets well nailed to the lower edge of the rafters to hold the cross boarding on which the concrete is laid. When desired, slates or tiles may be either nailed to the concrete or bedded into it while yet in a damp state. The pitch most suitable for a concrete roof is about ⅛in. to the foot. This is ample to carry off the water and not too much to affect the cement while being laid. Once a concrete roof is properly finished and all settling ceased, the roof becomes almost everlasting, or at least it will last as long as the base on which it is constructed.

The Uriconium (Wroxeter) Excavation Committee have, in view of the war in South Africa and other unforeseen circumstances, decided not to ask for the payment of subscriptions promised for the current year, but to suspend the proposed work (of exploring to the floor-line a large room connected with the baths and adjoining the basilica) for a period, until there are fewer claims on the public purse. This patriotic action of the Uriconium Excavation Committee seems one most worthy of adoption in other similar cases, and we may hope that the promoters of several restoration schemes will be persuaded to forego their fell designs, as those of this more worthy scheme have done.

New Patents.

These patents are open to opposition until October 1st.

1899.—Fastening Pipes to Walls.—16,986. J. FIELDING, 46 Manchester Road, Hollinwood, and W. C. SMITH, Melbourne Villa, New Moston, Manchester. The object of this invention is to fix pipes to walls without soldering or brazing being needed. This is accompl shed by using a piece of thick sheet lead stamped or cut to a shape somewhat resembling a Y. The lead is fixed to the wall by means of screws, the pipe is placed on it, and the projecting arms are then folded over.

Substitutes for White Lead.—17,244. G. VON REINOLTS, 2 Streatley Road, Brondesbury, London. The preparation consists of carbonate of lead, sulphate of lead, oxide of zinc, sulphate of lime, and carbonate of lime, mixed together in about equal proportions. It is claimed that this mixture has greater opacity and will cover a larger area than white lead, and is less poisonous.

Valves.—18,226. J. D. GILMOUR, 190 Butterbiggins Road, Glasgow. The face of the valve proper is formed with a ring of soft alloy (lead, 95; antimony, 3½; tin, 1½), instead of asbestos or similar material. This allows the face to be readily trued.

Cutting and Carving Stone, &c.—19,123. P. STUART, Regent Dock, Limehouse, London, E., and A. G. EDMUND, Kesteren Asylum, Ranceby, near Grantham. A horizontal table is mounted on a frame and adapted to move vertically by means of a screw. A jointed tool arm having a tool for working the material is clamped to an adjoining table, and means are provided for operating the tool from a shaft. A device is arranged for blowing away the dust.

Door Hinges.—19,134. C. PORTER, 43 South Hill Road, and F. D. BISHOP, 130 Wrotham Road; both of Gravesend. This hinge consists of an arm projecting from the door and a transversely slotted angle-plate embracing the corner of the jamb, the arm being pivoted within the angle. This renders the full width between the jambs available as a passage way when the door is opened. The invention is particularly applicable to doors in places like passages where they cannot be swung back sufficiently owing to the wall.

Grinding Machines.—19,177. H. BING, jr., Teynham, Sittingbourne. The machine has plates with grinding surfaces having alternate ridges and furrows between which the material is ground by a back and fro motion. The machine is particularly intended for grinding the clinker used in cement manufacture. It is claimed to effect a saving in power and to be simple and inexpensive in construction.

1900.—Forming Foundations.—7,925. A. DUCLOUX, 5 Rue de Laborde, Paris. The usual methods for preparing loose ground for building upon are pile-driving, the formation of framework, excavating and filling with concrete, &c. According to this invention a cast-iron monkey, shaped like an artillery shell, is dropped from a pile-driver into the ground, and the hole made is filled with pebbles, &c. After a sufficient number of holes have been made and filled the surface of the ground is consolidated with a flat monkey.

The following specifications were published on Saturday last, and are open to opposition until October 9th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—9,273, DAUBENSPECK, refractory incandescent mantles or hoods. 15,391, JONES, door handles. 15,755, BRÉCHOT, apparatus for the destruction of solid sewage and other matters. 16,055, JONES, electric switches. 16,729, MILLS, automatic wheel-locking mechanism or devices for trolleys, hand barrows, &c. 17,243, KELLAWAY, acetylene-gas generator. 18,142, COOKE AND COX, sash windows. 18,556, BRITISH PURE ACETYLENE GAS SYNDICATE, LTD., AND TALBOT, apparatus for generating acetylene gas. 18,661, IRVING, gate or door hangings or hinge devices and catches. 18,698, ROGERS, sink, bath, and similar waste fittings. 18,990, LOCK, BARR AND NADALL, valves. 19,051, GUMMER AND GUMMER, valves, cocks, taps and similar water fittings. 19,562, DARRAH AND JONES, slop-stone or sink fitting, also applicable for other purposes. 19,578, DRAPER, fire bars. 19,587, RHODES AND GAUNT, syphonic flushing apparatus. 19,678, HEDGES, lightning conductors. 19,722, CLEGG AND BROOKE, block for constructing and lining sewers, conduits, wells, arches, &c. 20,058, BAILEY, means for attaching door knobs and cupboard turns to spindles. 20,506, NESBIT, joints for metal pipes and tubes. 21,103, HALL, fire-dogs or supports or rests for fire-irons. 21,303, SHREEVE, chimney top or ventilator. 21,576, VON RITTERSHAUSEN, filtering materials and method of manufacturing them. 22 496, BRITISH LUXFER PRISM SYNDICATE, LTD. (*Basquin*), prism plates suitable for windows. 24,261, DICKINSON AND GARLICK, valve or cock for gas and other fluids. 24,514, BOULT (*Saldaña*), electricity meters.

1900.—3,064, SMITH, means for connecting corrugated sheets at the angles of roofs and other structures. 6,414, COPE, bolts and means of operating them. 6,747, LUNKEN, renewable seat valves. 7,366, PIEPER, construction of double casement windows. 8,349, RENNER, grinding machines. 8,671, SCHULZ, electric switch. 8,712, GORSE, PROBERT AND PEED, cut nails and their manufacture. 9,233, WEINBERGER, bayonet joint attachments for glow lamps, safety fuses, &c. 9 285, WILHELM GERMUTZ AND ALEXANDER MATHIAS BESCHORNER, water meters. 9,879, KRAYN, electric incandescent lamps. 9,892, SACKETT, mills for disintegrating rock and similar substances. 10,039, APPIANI, enamel containing no tin for ceramic ware. 10,191, BOERLAGE, connections or fittings for gas pipes and burners. 10,893, WILLIAMS, valves or taps. 10,993, HADDAN (*Adams and Westlake Co.*), acetylene gas generators. 11,111, BOULT (*Koyl*), apparatus for purifying water. 11,126, SORENSEN, outside window blinds. 11,189, DE LONG AND D'HOMERGUE, linings for cold storage houses, dwellings, buildings, &c. 11,347, SEUMENICHT, cement kilns and drying chambers. 11,594, KISTNER, saw sets. 11,685, MORRIS, refuse or dust bins. 11,876, WIENKE, device for securing and sealing sliding and other doors. 11,916, SAWIN, pipe wrenches. 12,106, HOSSFELD, trolley for carrying iron girders, timber baulks, &c.

Trade and Craft.

Electric Bells.

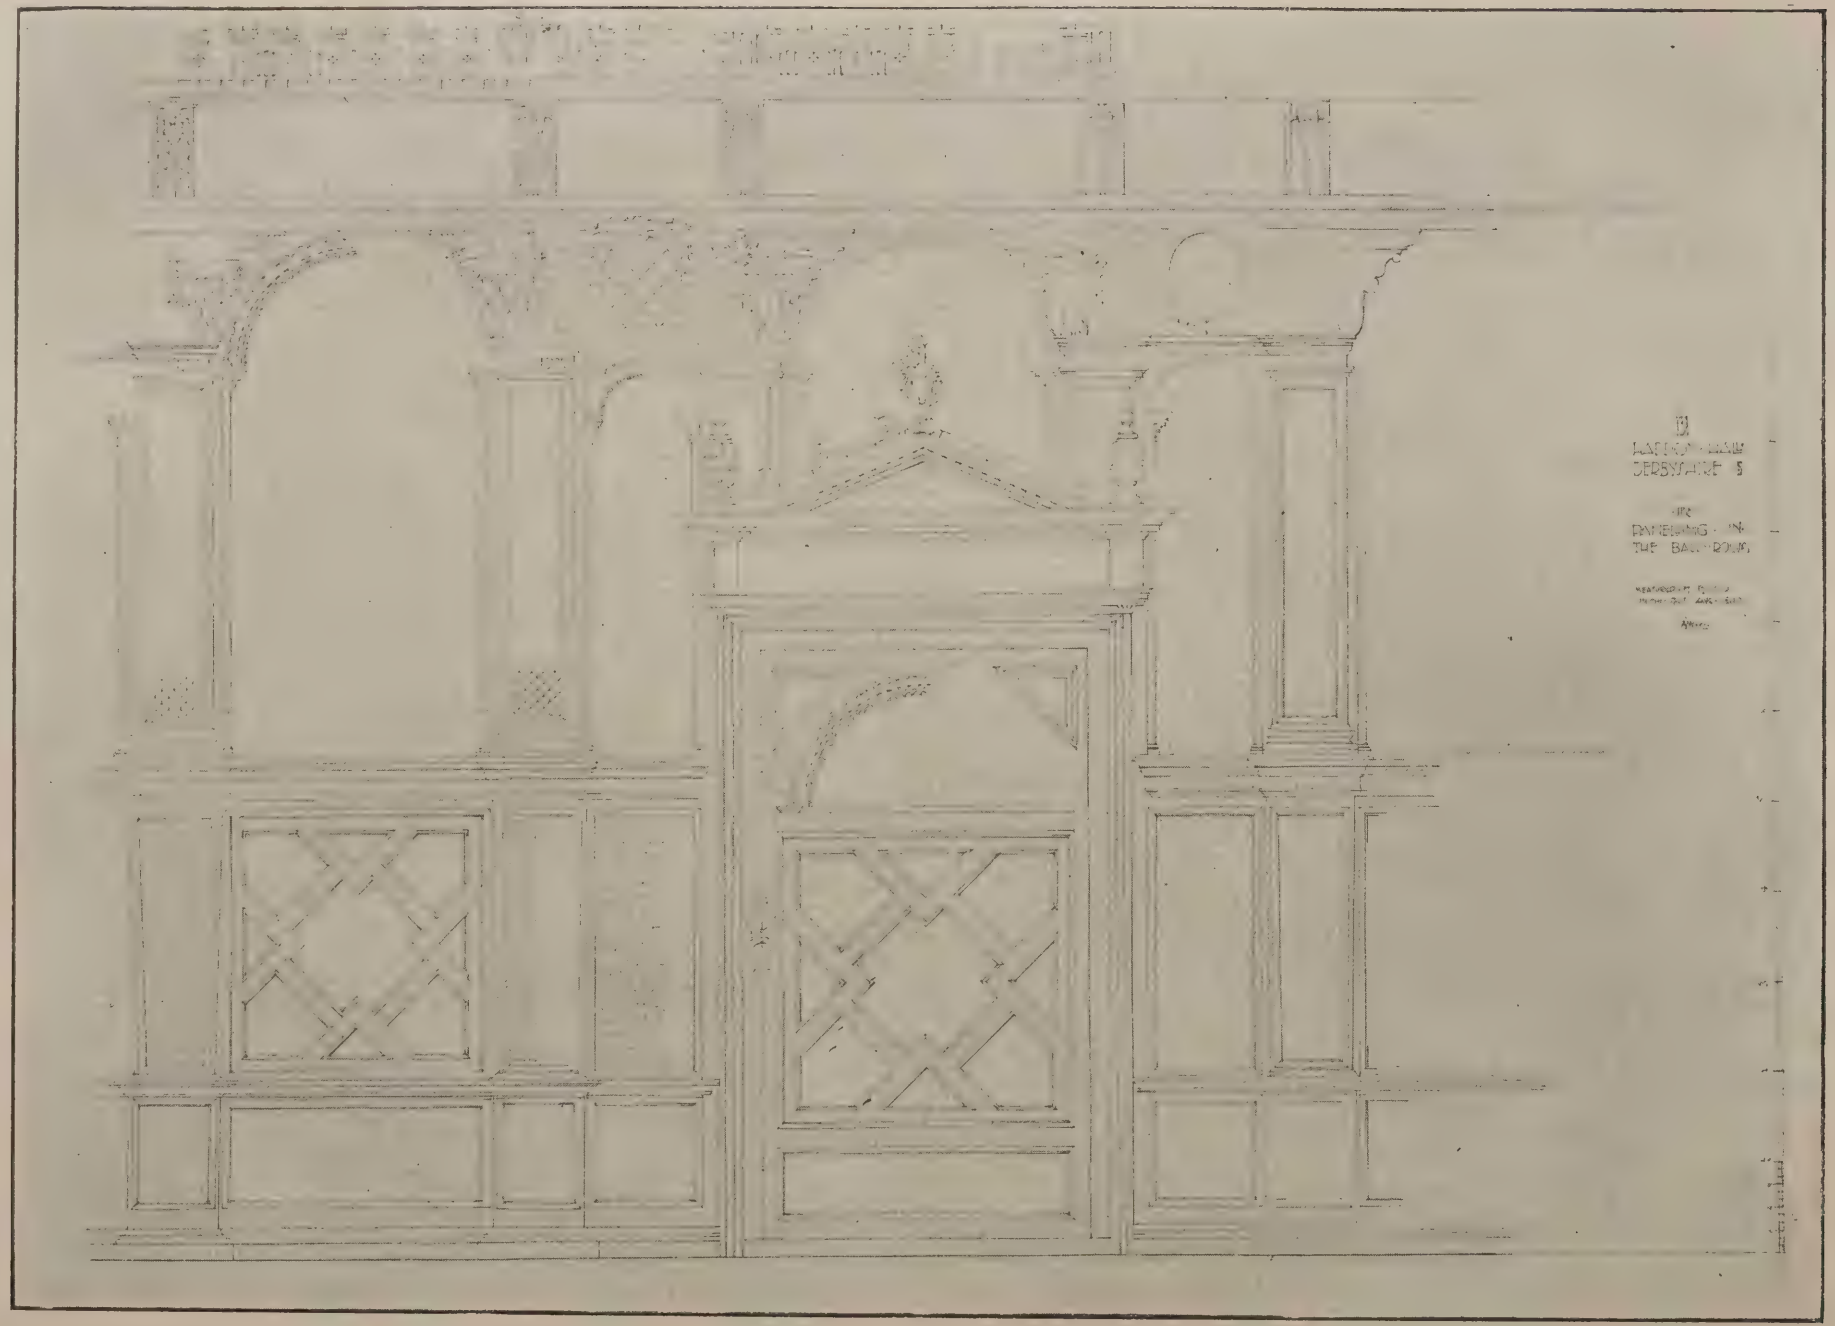
The new catalogue of electric bell material which Messrs. Julius Sax and Company, Ltd., of Eagle Works, 119 Coldharbour Lane, Camberwell, S E., have just issued is a most complete one, comprising more than one hundred pages—in fact, the firm claims that it is the most complete of its kind ever produced. All goods are guaranteed to be of "best English make," and in support of this statement customers are invited to inspect the works, where special plant has been laid down to compete with foreign manufacturers. Electric bells of every kind are shown—ordinary, continuous, single-stroke, skeleton, bracket, watertight, intermittent action—the remainder of the catalogue dealing with pushes, indicators, cells, switches, fire-alarms, telegraph and telephone instruments, and electricians' tools. Messrs. Sax's indicator movement is a horse-shoe magnet, and has two poles instead of one, and the spring is so arranged that there is an almost entirely closed magnetic current: this, of course, increases the force of attraction. The indcators include some for desk and office use, and a very ingenious one for carriages, marked with "left," "stop," "home" and other directions for the coachman. Some of the designs for pushes are very pleasing, though many of them are too ornamental, and that numbered 1058 is altogether bad. The patent electric guage for determining the height of water in reservoirs, &c., has been supplied to the Watford U. D. C., Teddington Sewage Works, and many other establishments, while on page 97 of the catalogue is illustrated the firm's patent electric billiard marker, which registers up to 100. Owing to misunderstandings which have recently occurred Messrs. Julius Sax and Company, Ltd., wish it to be known that they are the original firm bearing that title, established in 1855, and that they have no connection with firms called by a similar name.

THE PAINTING OF DOORS.

ALTHOUGH the doors are usually the last parts about a house that are finished, they are the first primed. For the treatment of a new door to be finished in paint some prefer a flat priming of umber and white lead, half and half, mixed with raw oil. Use oil enough to bind it secure and no more. This proportion thoroughly fills and works well with sand-paper, giving a fine surface for subsequent coats of paint. Putty nail holes and fill all cavities with a hard putty that dries tolerably quickly. A great deal of trouble caused by putty falling out and getting loose is traceable to filling the holes only partly—bridging from side to side, leaving a cavity under the putty. The putty is likely to be pressed further into the holes when sanding, leaving a hollow which is sometimes not noticed until after the work is varnished. Press the holes so full that when the finger or putty knife is passed over them the putty will bulge up. If the putty is good there will be no further trouble.

After doors have been exposed they generally draw apart at the joinings. Seasoning appears to make little, if any, difference. If these places are filled with putty it is only a matter of time until they become loose again, portions of the putty dropping out, what remains getting loose, and the door looks worse than if it had not been puttied at all. The best thing to do then is to refit.

The painter finds doors in all kinds of conditions, and if he is expected to do a good job on any particular part it is on the front door. Sometimes he finds them so covered with successive coats of paint from time to time as to resemble an alligator's hide. The only way to make a job of such a door is to burn off. Painters have said that they have successfully plastered over doors of this kind and made a permanent job; but this is doubtful. Don't attempt to sand it down level, as it will take longer than to burn off and repaint. Usually such a door is in good shape to repaint after burning off. It has generally been kept well painted or it would not have the alligator-hide appearance. The reason there are so many doors in the country like this is that people buy a can of paint to do a small job. Some of it is left; they do not want to throw it away. If it is near the right colour, and there is enough of it, they tackle the door, thinking they can paint out all discrepancies, with the result that they make them only more pronounced when the paint becomes dry.



In cases of old hardwood doors, in which glue and nails were used to hold the mouldings in place, which have been kept well painted and are in fair condition, they may be finished by burning off and using a flat filler. In some instances they are in a very bad condition—moulding loose and weather checked in every portion. Do not attempt to get the mouldings back in place, because it cannot be done. Being in use for years, dirt has got behind them, which prevents them getting in place. The only way is to take off the mouldings and clean off the dirt behind them. If warped, soak in hot water, when they may be sprung back into position. If weather-beaten so much that they are scaly with rotten wood, scrape off what you can and partly smooth with coarse sand-paper; then take one of the plaster of Paris products now sold for decorative purposes, mix it to a paste and with a trowel plaster the cracks full. Then sand level.

Concerning the finishing of outside doors with varnish, it is a principle in painting that no varnish which is much exposed, no matter how well suited for the purpose, does well over straight oil coats of paint. Varnish to do its best must be over flat coats, well rubbed and perfectly dry.

Bricks and Mortar.

APHORISM FOR THE WEEK.

A man need not be an architect to live in a house.—GOETHE.

Our Plates. THE Cross Keys Inn, Edmonton, situated adjacent to the fine old parish church of Edmonton and adjoining the old Edmonton railway station, was pulled down and destroyed a few years ago. It is very greatly to be regretted that it was not spared, as its great picturesqueness, fine colouring, and general grouping, combined with its antiquarian interest, made it an extremely interesting old-time place. The sketch reproduced was made in the summer of 1838 by Mr. H. Dymoke Wilkinson. In the interior there was much that was interesting. Many of the walls were of immense thickness, all lined with panelling of many dates. Some very fine old mahogany panelling, probably of the time of Elizabeth or a little later, was especially interesting. The fireplaces, throughout of the last century, were of simple though admirable design. They were chiefly in wood, with one or two good marble ones. The staircase was very plain, with a moulded handrail and twisted balusters.—The illustration of the banqueting hall at Haddon Hall is by Mr. Frederick Adcock, and that of the panelling of the ballroom from a pencil drawing by Mr. J. A. Woore. The latter was one of a set that gained a medal of merit in the R.I.B.A. Pugin Studentship competition this year.—"Moss Gate," by Mr. W. H. Ward, of London, W.C., is a small country house near Keswick, situated on a gentle slope facing south, and commanding on that side a pleasant view of the Newlands Valley and the surrounding mountains. An attempt has been made in designing it to keep in the local traditions and to preserve the simple and austere style characteristic of the district. The walling is of green Borrowdale slate-stone, and is executed in the local manner; each course has a slope outwards to throw off wet, and the mortar is kept 3in. back from the face, giving the appearance of a dry wall. The roof is covered with slate from the same quarries. All external woodwork is painted white except the doors, which are green, and the front door, which is oak. Internally a special feature has been made of the staircase and of the dining-room ingle, the latter of which is paved with red tiles.

"Big Ben." THE great clock at Westminster, 320ft. above the ground, is stopped for repairs; but it can show a good record, as ever since the year 1859, when it was constructed and erected by Mr. Dent, it has hardly ever been more than one second out of time. Messrs. Dent and Co. contract with the Government to keep it within two seconds of true time. The present clock tower occupies as nearly as possible the site of the similar great structure erected by the first Edward, the cost of which, it is said, was defrayed by a fine exacted upon a certain judge for accepting a bribe. This ancient tower contained "Great Tom of Westminster," a bell now only known by repute and superseded by the first "Big Ben," which weighed 16 tons, but, being found defective, was broken up, and was succeeded by the present giant. The big clock's face measures 22½ft. across its dials, the hour hand is 14ft. in length, the weight of the hammer is 4cwt., the winding up of the going part takes ten minutes, the winding up of the striking parts—the quarter and the hour part—occupies five hours each and has to be done twice a week. Its pendulum weighs 680lbs., and the figures on the enamel dial are each 2ft. long. The bell weighs about 14 tons, its circumference is 27ft. and its height 6ft. 6in. It is ornamented with Gothic figures and tracery in low relief, and is inscribed with the date of its casting. Keeping it company are smaller bells of 4 tons each, which note the four quarters. When the clock is thoroughly cleaned its solemn note upon the midnight air will once more be welcomed by Londoners as the voice of an old friend.

The New Government Offices. THE work of excavating the site for the new Government buildings at the bottom of Whitehall is proceeding apace. The present level of the ground—that is, 30ft. below the roadway in Parliament Square—consists of fine yellow sand, and in its vast extent it suggests a beach by the sea. There would be water as well to bear out the analogy were it not for the extreme precautions taken to keep it under. Night and day a powerful pump is at work, sunk below the level of the sand to prevent flooding. How great the danger is may be judged from the fact that about 10,000gals. of water are pumped out every hour. When the works were first started nearly 20,000gals. an hour was the average. It is fairly well known that the Thames flowed over this part of Westminster for centuries. Even in the early days when the Abbey over the way stood on an island, all the ground now occupied by the Government offices south of the Horse Guards, as well as the site of the Houses of Parliament, was more or less under water. The strata at the present excavations reveal the effects of the water period immediately the made ground and old foundations are penetrated. Before the fine sand is reached there is a stratum several feet in thickness consisting of loam, sand and vegetable matter such as would be washed down a river from higher ground. It is of a dark appearance, and has been likened to peat. In fact, it is said to contain sufficient vegetable matter and wooden fibre to make it as combustible as peat. The sand is reached 18ft. down, and is about 10ft. deep. The contractors are penetrating through the sand to the gravel in order to find a sound bottom for the 6ft. bed of concrete on which the foundations will be laid. Before many months pass the whole of this cleared space—700ft. long, 350ft. wide and 30ft. deep—will be walled in and covered with concrete. Then the builders will come upon the scene and commence their six years' task of erecting the new offices.

Aberdeen's City Architect. AT the last meeting of the Aberdeen Town Council Councillor Johnston moved: "That in view of the great increase of architectural work devolving upon the Council, it be remitted to the Special Committee in connection with the burgh surveyor's department to consider and report on the duties of the city architect (Mr. Rust), and whether an arrangement can be carried out to combine the whole of the city's architectural work under one official and office." Mr. Johnston said that he had compiled figures regarding the works carried out by the Town Council since 1892 up to 1899. On the City Hospital £25,000 had been spent; on the police workshops, £7,000; on workmen's dwellings, £10,000; on the Corporation lodging house, £16,000; on the police stables, £3,000 on the new fire station, £10,000; on the bathing station, nearly £15,000; on public conveniences, nearly £8,000; on the police offices, £14,000; or about £110,000 altogether. With the sums spent on public works carried out by the Town Council, the total amount reached something like £140,000. In Edinburgh there was an official styled the city superintendent of works, who devoted his whole time to the office. In Dundee they proposed to abolish the office of city architect. In Glasgow there was a superintendent of works. Now, it seemed to him that the time was very opportune for the question of the architectural work of the city to be considered by the Special Committee. The Lord Provost said they were asked to look into the whole matter of the burgh surveyor's department. In that department they found at present two architects with some assistants, and he looked upon that as certainly coming under their purview. He failed to see that there was any slur cast upon Mr. Rust at all. If they dismissed Mr. Rust and appointed another, that would be a decided slur; but if they found in the course of events that matters could be better met by having a certain class of work done by a certain set of officials, they were perfectly entitled to make a rearrangement, as they found it necessary. After a good deal of discussion the motion was carried by 16 votes to 8

London Government Act. ON the first of November next the London Government Act will become operative, and eight days afterwards there will be twenty-eight gentlemen entitled to call themselves mayors of as many metropolitan boroughs, not to mention the 227 aldermen and the 1,362 councillors. Not only do the new municipalities inherit all the duties, property, and liabilities of the old vestries and district boards, but they will take over many of the powers of the County Council at once, while others will probably be from time to time delegated to them. Perhaps the most important privilege assigned to them is that of promoting or opposing Bills in Parliament, a right which, so far, only the City Corporation and the County Council have enjoyed. In future the municipalities and not Spring Gardens will deal with wooden structures, sky signs, street obstructions and the registration of dairies, slaughter-houses and other matters comprised in the Public Health (London) Act; while they will have concurrent jurisdiction with the Council in such matters as the Building Act, the regulation of water companies and the housing of the working classes. They will manage main roads and bridges and will be able to stop up streets without asking the consent of the County Council. Then there are provisions for transferring other powers from the central to the local body; and in order that there shall be uniformity of practice it is enacted that when such transferences have been made to more than one-half of the municipalities the County Council shall, through the medium of an application to the Local Government Board, compel the rest to take over the same liabilities. Indeed, so far as circumstances permit these new corporations are made as similar to the large provincial municipalities as possible.

The Fee that Wren Received. IT has always been the practice of the bulk of humanity to grumble at the wages, salary or fees received for work done. Even such beneficent beings as architects are not exempt, for, strange as it may seem, they are no more than human. But a look at the records of the past will show that after all present-day architects are not so badly off. For the "great care" and "extraordinary pains" which Sir Christopher Wren took in connection with the rebuilding of St. Stephen's, Walbrook, the magnificent sum of twenty guineas (about sixty-five guineas in current money) was granted him. Five per cent. is not so bad after all, and what of the extras? Mr. Mountford has already received as his premium for the Sessions House design much more than Wren did for all his work on the church mentioned. O! ye gifted architects of 1900, meditate on this and weep for your professional sins.

The Working Men's College. IN these days of technical and secondary education enthusiasm, when polytechnics and University settlements abound almost on every hand, very little attention seems to be paid to a London institution which was the pioneer, by a very long lead, of all similar institutions. The Working Men's College in Great Ormond Street was founded as long back as 1854 by Frederick Denison Maurice, father of the present General Maurice, C.B. It is an institution rich in memories of the great educational pioneers of a past age—of such men as Kingsley, Judge Hughes (the author of "Tom Brown's Schooldays"), and Ruskin; but enthusiastic supporters of the college in Great Ormond Street are not nearly so numerous as they once were, although the classes are still conducted with considerable enthusiasm. The building is sadly in need of repair, but the building fund started has only at present reached £5,000, while nearly £20,000 is required for the new building. It seems a great pity that the pioneer of educational institutions for the people should be languishing while a few thousand pounds would set it on a proper footing again. It is greatly to be hoped that wealthy educational enthusiasts, including admirers of Ruskin and the other founders, will rally round this time-honoured institution.

THE PARIS EXHIBITION.

BY F. HAMILTON JACKSON.

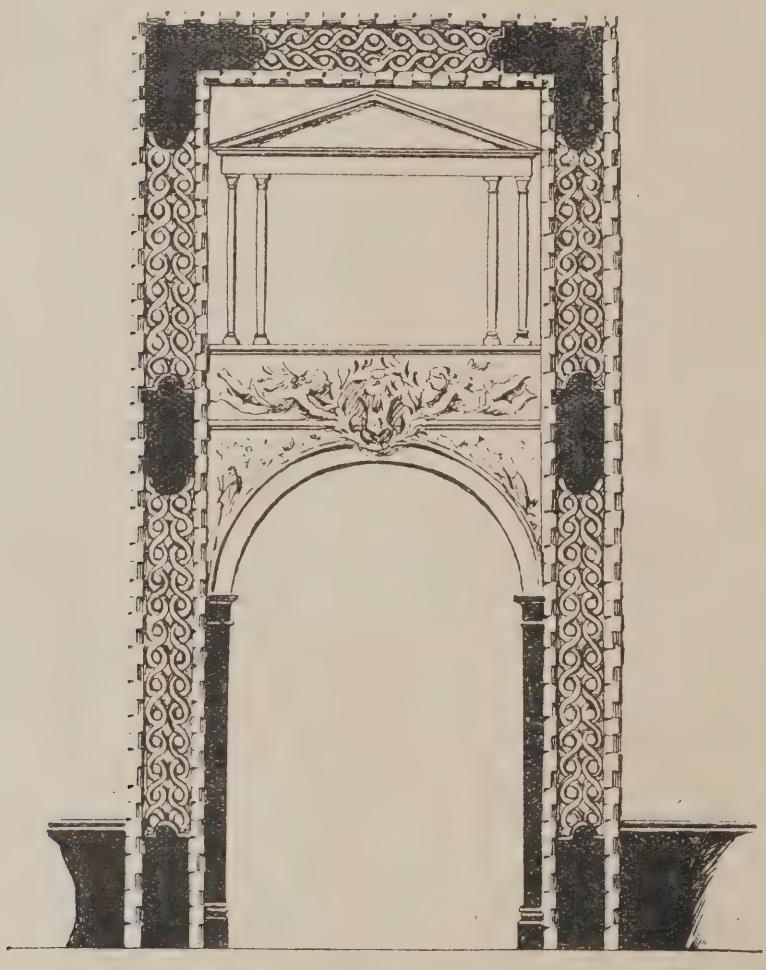
II.—THE DECORATION OF THE BUILDINGS.

(*Continued from page* 31, No. CCLXXXVIII.)

THE decoration of the various buildings which form the Exhibition is carried out in various materials. There is first sculpture proper, whether in bronze, stone, or marble, with which may be grouped the plaster enrichments of various kinds of which such great use has been made; pottery, whether of one colour or of many; mosaic and painting; stained glass and plaster coloured to imitate wood carved and painted; and metal work, gilded or in its natural colours. The sculpture proper is most of it attached to the two permanent palaces, one of which contains the exhibits of pictures and statuary and the other a splendid collection of decorative objects illustrating the history of artistic labour from its beginnings in France up to the year 1800. Nearly every class in the Exhibition has also its retrospective exhibition dating from 1800 onwards, so that one has a most interesting series of examples of French art from the earliest times to the present day to examine if one takes the trouble to look them up in their various places. The Pont Alexandre III. is also decorated with groups of figures in stone and bronze, painted green or partially or wholly gilded, and with candelabra and ornamental escutcheons, &c. The character of the decorations of the Avenue des Invalides may be gathered from the eulogistic remarks of the French guide published by Hachette: "a succession of white and golden walls, of castles of cream and palaces of sugar, besprinkled with many-coloured syrups, decorated with sweetmeats cut into the shapes of oriflammes and vases." The palaces are in fact over-decorated with fantastic and too-projecting forms, suggesting the lack of restraint which one finds in Hindoo art, both in the want of a sense of constructional application and in the arrangement of subordinate parts. Two of the principal façades have been handed over to the tender mercies of the painter, with very unfortunate results. The architecture was not of much account perhaps, but the coloured work entirely destroys what architectural feeling there may have been. The general idea appears to be suggested by confectionery, and the idea of decoration seems to require but two things, plenty of female figures in high relief and scrolls and swags of flowers and fruit of the periods of Louis XIV. or Louis XV. The Palaces of Pottery and Fixed Decoration, which face each other across a broad space having beds of standard roses which smell sweetly, are decorated on the upper storey with three large compositions on each face—on one side the Arts of Earth, of Wood and of Stone, and on the other the Book, Weaving and Metal. Of these the best is "Weaving," by Paul Buffet, whose work seems to be founded on Henri Martin, but who has a good feeling for colour, with a certain quaintness of arrangement. The Arts of Earth and Stone on the other side are also tolerably good when seen from across the square, but do not bear a closer inspection well. In these also the "pointillistes'" manner of work seems to have inspired the artists.

FIGURE OF PEACE, FURNITURE PALACE.

From the pavilion of the town of Paris, westward along the Cours la Reine, stretches the Rue de Paris, flanked on one side by the various side shows which are intended to make people laugh and extract francs from their pockets. Here are the Maison du Rire, the Palace of Tableaux Vivants, the Garden of Song, La Roulette, Le Grand Guignol, the Theatre of Gay Authors, Bonhommes Guillaume (marionettes), and the Theatre of the Dance—all decorated with painted friezes of figures and other ornaments in plaster and colour. These are often tolerable in decorative colour, and sometimes even not bad in drawing, but the treatment and subjects are often such as would not be tolerated in English fair booths. No doubt it is very fine Art Montmartrois, but if the entertainment within is fairly indicated by the decorations of the outside it is of a character which the Englishman only goes to see when in Paris. The noise along this street is distracting in the afternoon and evening, and the crowds make it almost impassable. From each show come sounds of drums and trumpets, interspersed with shouted conversations and orations from personages in strange costumes, at whom the crowd wonders and laughs. Fortunately, the quiet person can avoid it by descending to the lower walk by the Seine, from which such an excellent view may be had of the Pavilions of the Nations on the other side of the river. These pavilions are among the most striking and attractive portions of the Exhibition, and I hope to return to them later, together with the very clever "Vieux Paris," which reproduces many of the buildings of historic interest no longer existing. In the section "Navigation and Commerce" two interesting buildings are to be found. The pavilion of the Peninsular and Oriental Steam Company has a good though rather extravagant frieze round the top in modelled plaster coloured and metalled, showing ships and clouds and broad rays of the sun. The spandrels of the portico also are decorated in the same manner. Other panels surrounding the lower parts are of figures uncoloured, and not so successful. The domes appear to be covered with aluminium, which makes them very bright. The other interesting building is the German pavilion of mercantile marine, which is crowned by a reproduction of the lighthouse at Bremen and has a cleverly painted frieze representing sea and ships of different sorts. Owing to its being carried right round the building, dropping into angles and passing over curved forms, the horizon is unpleasantly distorted. Two figures modelled in the round and coloured form part of the decoration above the door, mingled with ropes, anchors and oars, round the archivolt runs a very conventional ornament, and above is a heraldic eagle, also conventional, showing considerable incongruity. The Palace of Forests, Hunting and Fishing, a little further on, has a painting by M. Aubertin on its façade, which would be effective if carried out in mosaic. The doors and two small windows with balconies are set back within a great niche in the façade. At the top, on a yellow ground, upon which project deep red masses which one supposes are rocks, a boat appears; two men row and two haul in a net. At each side the waves throw up spray, being themselves a dark blue, which changes to palish green a little way down, and one sees red and blue fish, gold-coloured seaweeds, the net, and darker green masses against which pale purple anemones float below. A few birds fly round the fishers. The rest of the decoration shows how one can go wrong, animal forms and wood forms being combined with the architecture in a monstrous manner, which is highly praised by the French guide. The sculptor has, in fact, ousted the architect. The Palace of Mines and Metallurgy has at the angle a very fine doorway crowned by a great dome, and flanked by two towers also finished above with a kind of dome. Here is placed a carillon of thirty-two bells, which execute various pieces of music—"Adeste Fideles," the Christmas hymn so familiar to our ears, was followed by an air from "Les Cloches de Corneville" and others equally incongruous in juxtaposition. The bells range from a weight of 4 kilos to 840. This monumental porch is a very successful piece of decorative colour. The mass of the central dome is warm green, the ribs cream colour, with bosses of pale yellow and blue. The arch is dull yellow, the shields with which it is ornamented pale blue, the whole being apparently made of glazed pottery. The smaller domes are dead coloured and decorated with garlands and two cartouches of bluish-green with brown ornaments, a lower band of decoration bearing leaves and flowers in the same colours. The globes at the summit of the flanking towers are a pale turquoise



WINDOW FROM INVALIDES ENTRANCE. DRAWN BY F. HAMILTON JACKSON.

the rest coloured in pale browns and creams. It has the same Oriental suggestion which is so evident in other parts of the Exhibition, in this case not unpleasantly.

The Palace of Transport has a very fine frieze, signed A. Allar, which shows barbarians, Egyptians with a sphinx on a cart, Arabs on camels, Indians in palanquins, howdahs and carts drawn by oxen, Russians on sledges, Laplanders with reindeer and dogs, Greeks in boats, one of which is towed by oxen! a bride and bridegroom in a cart drawn by men and girls with music, a Renaissance horse litter and Buddhist wheelbarrow full of girls! Coaches, sedan and sledge from Holland, hand sledges and Louis XV. coach, on one side of the grand central portal. On the other a diligence, steam coaches and cabriolets, stage coaches, railway trains, an ambulance, a Hansom cab, a cripple's carriage, a trolly with a marble group, an omnibus and a perambulator, balloons and air ships, a military captive balloon, a high bicycle, a motor tram, a triplet cycle and a motor safety bicycle, as the most modern inventions. The figures are white against a background of pale turquoise green. Upon the piers from which the arches spring below are reliefs of artisans connected with railways and other modes of transport. These single figures are not so successful as the frieze. The most successful frieze, however, is that on the façade of the Grand Palais towards the Avenue d'Antin, which has been made at the pottery manufactory at Sèvres from the designs of M. J. Blanc. It is in high relief and glazed, being treated with considerable variety of colour, and runs along above the windows beneath the colonnade, the figures facing towards the grand doorway. On the left is ancient and mediæval art, led by S. Louis on a white horse, which again is led by a white-winged angel bearing a cross; a little genius a trifle further back bears a tablet inscribed "Fides," indicating that from Egyptian and Assyrian times Faith had been the chief inspiring principle in art. On the other side all is changed. A very flamboyant and meretricious "Art," surrounded by a large nimbus with rays, flaunts it on a gilded chariot companioned by draped and nude figures of both sexes. Behind follow the great men of the Renaissance, who it is plainly suggested followed Art in place of Faith. The series commences with Cimabue and ends with Garnier the architect, whose Grand Opera appears in the background behind him. The ground here is of varied blue-green, against which typical buildings show in warm cream colour behind the different groups of the long procession. The greatest effort in the way of decoration has been made in the "Salle des Fêtes," which is regarded by the French as a veritable "tour de force," and upon which the Parisian talent which is considered the best has been employed. Fernand Cormon, François Flaming, Albert Maignan, and Georges Rochegrosse have painted the immense compositions on the vault. Men of less reputation have assisted with subordinate work, though J. P. Laurens occupies a place above the eastern tribune. The sculpture is also clever, though the inspiration is as usual sought from the labour of the prolétaire, and around the balustrade separating the hall from the galleries are placed thirty-six statues, which represent the thirty-six nations who exhibit. The effect is good on the whole and the colour pleasant. The hangings are of a warm yellow green, with borders of brown gold, and the general colour is a pale yellow green and low-toned cream, relieved with a pale gold colour and with dull red in the recessed parts, a good deal of the modelled ornament being left white. The most successful of the lower range of paintings are those by MM. Gabriel Biessy and Louis Bégaux, representing "The Desert" and "The Sahara Scrub," in which the subjects are treated as sunsets with a good deal of red and orange and an upper border which is very successful in uniting the pictures to the general red tone of the recesses. The "Woods and Mountains of the Asiatic Continent," by MM. Piérre and Jean Paul Laurens are also decorative, though not so much so as those just mentioned. There are three main entrances on the ground floor, and a great staircase which ascends to the gallery on the fourth side. At the bottom of this stair a couple of nude figures hold lamps in a right-angled sort of way. One thinks that for such a position and service draped figures would have been better, both as regards mass and composition of line. Between these entrances, which are flanked with broad ornamental piers, are eight iron columns, two between each, which support three arches, and so bring the plan from a square to a circle. The webs of these columns are filled in with pottery panels in a very decorative and thoroughly constructional way, and the effect is excellent. A podium of cement runs round the central space, with massive gratings in it made of stamped tin! The principal ribs of the dome are overloaded with ornamental objects, and the dome generally is less successful than the lower part of the hall. The design of the glass velarium is apparently suggested by flights of rockets or a chromotrope, and is very poor, consisting of wormy lines and rosettes of pale and rather unpleasant colour, something like the pale windows in St. Paul's Cathedral, though the colour becomes fuller towards the summit. The planning of the angles with alternately projecting and recessed parts is very clever, and the effect is excellent.

By the other nations, apart from their pavilions, little is shown in the way of decoration, with the exception of Germany, Austria, and America. Germany is easily first, and her court in the Invalides palace and her rooms in the picture gallery are decidedly striking. To begin with the latter. Two staircases meet on a landing before the entrance to it, and the Germans have had the good taste to hide the structural ironwork with hangings of a yellow-brown sateen with a red pattern printed as border. Within the door of entry is a semi-circular portico of four Doric columns in white and grey mosaic, bearing an architrave of the colour of bronze patina and gold, upon which are two little Renaissance flying angels with a shield, and above which are two standing angels on a larger scale, also bearing shields. The curtains which hang between the columns are of a dull red plush. The wall within is stencilled in orange on a red ground. The door between this room and the next is divided into an archway and upper storey, framed with golden guilloches and a Venetian dentil border, with plaques of black marble at the corners, of which the dado also is made and the pilasters to the door. The arch, spandrel and frieze are the colour of green bronze patina, and two Renaissance angels appear again on the frieze, with a wreath surrounding the shield. The upper storey has a shallow pediment and narrow coupled columns, the latter gilded. On the other side the whole thing is gilded from top to bottom. The next room is hung with green yellow and has a modelled frieze in white on black. Beyond is a colonnade of streaky black marble (all imitation, of course), with little rooms off on each side, lighted from the top and hung with green, which conducts to an octagonal hall, also green, with a cornice of gold. The whole effect is very artistic and striking. In the court in the Invalides palace, also, a true feeling for architectural effect of the theatrical sort is shown. A flat archway of some depth is flanked by two equestrian statues of bronze on high pedestals. In front is a metal group of an eagle conquering a dragon (!), and around is an arcade of arches of various shapes opening into fitted rooms in which furniture is exhibited, from which steps descend to the central area, which is decorated with small trees and shut off by a shaped dwarf wall. Between the statues steps project, flanking a tank into which water runs from a metal mouth with pleasant trickle. Beyond the darkness of the flat arch is a large pottery wall-fountain, fully lighted, and beneath it is a space decorated at each side with columns and pilasters of onyx, and with niches and fountains. The floor is laid with mosaic, which is also used in the vault and on some of the columns, and a modelled frieze over the lower colonnades, coloured bronze and gold, adds richness to the decoration. The Germans have had the good sense to construct their own staircases, and they are very successful sometimes. In one there is a very original arrangement of

DOORWAY IN PICTURE GALLERY (GERMANY). DRAWN BY F. HAMILTON JACKSON.

balusters and panels. The influence of L'Art Nouveau is strong, and leads to extravagances, but when they have thrown that off they will have to be reckoned with as designers. In one room, which was a good deal over-carved and decorated, was an inlaid design in which the framing cut through the subjects with a fine disregard, in one place severing a horse's nose from his head and neck and distributing the fragments in two adjacent panels. Part of this subject was hidden by a constructional seat! and in other parts of the room and on the ceiling the same defects were evident. The Austrian picture galleries are a little over-grey in tone, but very quiet and refined. The pictures are scattered along the lower part of the walls. L'Art Nouveau reigns, and one is rather worried by the strange cuttings and piercings of the woodwork and the affected curves of the stencillings of the friezes and bands of ornament. The colours used are grey with greener grey and pale yellowish stencillings and red stained woodwork in one room. In another the same ground (a sort of twilled Bolton sheeting), with the addition of gold in the frieze and metal mountings to the brown-green stained woodwork. In another a pale brown is used with embroidery of pale old-gold colour and toned white, with woodwork stained a black brown. The door curtains are in excellent taste, double silk and cotton reversible fabric of good design and colour, and in another place of watered silk of a grey-green with *appliquée* of lemon green and embroidery of gold cord. The Furniture Court is not so good as the German section, though the feeling shown for colour is excellent. The divisions of the girders have been ingeniously made use of as panels, within which a casting of brass leaves and stems has been affixed with good effect. A room decorated by Czech firms has some well-executed decorative paintings, which are pleasant in colour and do not jump at one. The carving is a little overdone, but a cabinet with metal mountings has some delightful low-relief panels, and over the doors are metal grilles of greened bronze and brass, with pleasing arrangements of leaves or seaweeds, with masks. I observed in this section some extremely queer embroideries of *appliquée* cloth outlined in various coloured cords, so as to get different effects with the same ground colour. The United States has tried to give an architectural look to its section with a great arch flanked at each side by a group of sculpture, and a central pavilion from which colonnades extend in four directions, with a pretty ornamentation of branches and leaves, gold on white, surrounding the columns. The exhibits of glass are rather disappointing, and a bad copy of Raffaelle's "Miraculous Draught of Fishes" comes oddly in an exhibit labelled "Art Nouveau." One of the stalls in the perfumes section (Houbigant) has been decorated by Mucha. There are four painted panels with figures in relief, a figure in the round at the end, and several mirrors, all with the crescent-moon shaped bordering to which he has accustomed us. The statue has a sort of double nimbus of violets, roses and irises—artificial flowers—which shows plainly that the charm of his design is not the arrangement but the beautiful drawing and colouring. The figures are outlined in black and the interspaces coloured with rather delicate colours. The result is that the outline overpowers the colour and damages the decorative effect. There is a frieze of flowers also in relief below and between the wall hangings. The tables are extremely Art Nouveau, and are painted in pale colours; the dado has alternate lyre-shaped compartments of leaves and flowers in relief, coloured pale green upon grey green, and the same shaped compartments upside down of a plain browner pale green, with very good effect. The Union Centrale des Arts Decoratifs has a little pavilion to itself, consisting of four rooms. The first has stencilled patterns on the walls in two greys, yellow green and pale orange, the last two shading into each other, well designed, as is the border in pale yellow-green, darker green and grey and low-toned orange. The frieze and furniture are rather too much Art Nouveau, but are beautifully carved. The next room has woven panels about 12ft. high, of very good design, though with rather too many perpendicular lines. The plants employed are roses and bay intertwined with oak towards the top; crowns of bay occur at the top and near the bottom. The ground colour is deep salmon, the stems are grey, the rose leaves green and the flowers lilac: here brown outlines are used, and also to the stems, while the bay leaves are yellow-green and grey. The carving on frieze and furniture in this room is of the most delicate description, suggesting modelling in wax. The treatment is rather too naturalesque for the purpose to which the ornament is applied. The next room is all grey-green pottery, with a frieze divided into sunk panels by pilasters within which is fruit growing on branches in high relief and treated with naturalism, while in the same panel are highly conventional upright flowers incised. One end of the room has a very sketchy fountain and many pots of good shapes and colours are dispersed about. Beyond is a Salon des Dames, which contains trifles in poker work and other things with which ladies delight to work. Notwithstanding, there is suggestion in the pavilion and much that is admirable.

(*To be continued.*)

Professional Practice.

Aberdeen.—The St. Clair Engineering Works have just been completed on the north side of Pittodrie Street for Mr. John A. Sangster, engineer, of Aberdeen. The main building, which has a total length of 135ft. and measures 90ft. in breadth, is built of granite rubble, with the exception of the east wall, which is of brick, in order to permit extensions to be readily carried out. The roof is very strongly constructed of pitch pine. The span of the main rafters is 40ft., and these are supported at each side by a row of strong cast-iron pillars. The slope of the main rafters is continued downwards to the outside walls, so that practically the whole of the main building is under one roof. Above the tie-beams of the principal rafters a loft, 25ft. wide, and running the whole length of the building, is formed, which will be used for the storage of patterns. Access to the loft is obtained by a stairway at the north end of the building, where, on the ground floor, is the pattern shop. The west side is principally occupied as a machine department. The east side will be used as a fitting shop. At the north end of the main building is also situated the engine-house, the walls of which are covered with V-linings, and the floor boarded. On the side next the Links, and adjoining the main workshop, the blacksmith's shop and boiler-house are erected. The main building is lighted on each side by three rows of roof-lights, glazed with patent ribbed plate glass, ¼-in. thick, carried on T-iron astragals extending the whole length of the roof. There are also a number of windows in the north gable, and along the east wall of the building. On the side used as the machine department the floor is laid with concrete, while the rest of the floor space in the main building is macadamised and rolled. At the south end of the works, facing Pittodrie Street, are situated the offices and stores, with the main entrance in the centre. On the left of the main entrance, which measures 14ft. in width by 12ft. in height, are the time- and store-keepers' office and tool room; adjoining this is the general store. On the right of the main entrance is a large store for oils, paints, &c., and the foreman's office. Ascending by a pitch-pine stair with ornamental iron balusters and polished birch handrail the upper floor is reached. In the centre is situated a counting-house. Adjoining this is the private office, from which access is gained to a stock-room used for storing finished articles. Connected to the counting-house by a passage enclosing the staircase is the drawing office, measuring 22ft. by 14ft. The whole suite of offices is lined 4ft. up from the floor with stained and varnished woodwork. The counter and other fittings are also stained and varnished. The upper portions of the walls are plastered and coloured with distemper. The heating of the suite of offices, &c., is effected by a series of direct-indirect steam radiators with ventilating bases, supplied by the American Radiator Company. The offices are divided by a 9in. brick wall from the large workshop. The new premises were designed and erected under the supervision of Mr. William Smith, architect, 316 King Street, Aberdeen, and the following are the names of the contractors:—M son work, Beattie and Beaton, St. Peter Street; joiner, J. and A. Arthur, Canal Road; slater, George Bain, Hutcheon Street; plasterers, Sellar and Company, John Street; painter, G. Donald and Sons, Netherkirkgate; plumber, J. Blaikie and Sons, Littlejohn Street concrete work, Peter Bisset and Son; all of Aberdeen. The iron-work used in the new building was supplied by Mr. Sangster.

Birmingham.—The construction of the important group of intersecting arcades on land lying between New Street, High Street and Union Street has progressed so far that early next month there will be a thoroughfare from High Street to a point in Union Street near Corporation Street lined with shops and covered with a glass roof, except where it crosses Union Passage. By Christmas all the buildings associated with these sections of the arcades will be finished, and considerable progress will have been made with the other parts of the scheme. The full set of arcades will not be complete, however, for another two years, though probably all the new thoroughfares will be open to the public before the end of that time. There will be then two arcades opening from New Street, one opposite King Edward's School and another starting from opposite Lloyd's Bank and entering the High Street Arcade at right angles. The portion of the whole scheme which, apart from the High Street and Union Street sections, is nearest completion is the latter arcade, which is being erected for the Midland Arcades Company. The rest of the scheme—the High Street, the Union Street and the upper of the New Street Arcades—is being carried out for another company, the City Arcades, Limited, but the whole of the arcades will really form part of one system. The heaviest portion of the preparatory work at the Midland Arcade has been done, and the basement is completed, and in about twelve months there will be a way through and the shops will be opened. Of the City Arcades, that from High Street has had its frontage completed for some time. The glass roof now extends for 228ft. of the distance from High Street to Union Passage. The Union Street section, about 100ft. long, is roofed in, and the façade of the Union Passage end is practically complete. This, like the other entrances, is in brick and terra-cotta. The design of the frontages to New Street, High Street and Union Street is of Renaissance character. The total height will be about 80ft., and all the ornamental features will be of terra-cotta, with the flat portions in dark red Ruabon bricks. In High Street the entrance is flanked by two shops on one side and one shop on the other, and in New Street there will be a similar arrangement. The High Street façade is broken by a series of embayed windows running to the top storey. The terra-cotta work includes a number of cupolas or campaniles supported on small pillars, with ornamental work, including a number of grotesque figures and faces serving as caryatides, gargoyles and keystones. The Union Street front, occupying the site of the Old Library, is designed in a similar manner, but with some structural variations. In New Street the frontage, which like that in High Street will be 62ft. wide, will be recessed, and the windows in the upper storeys will be fronted by an independent series of rounded arches on circular columns. The City Arcades themselves will be about 22ft. wide in the clear, the shop fronts being brought forward so as to form a balcony and leave a footway of about 15ft. The frontages of the shops, of which ultimately there will be about a hundred, will average 14ft., the depth varying, and over each will be a showroom opening on to the balcony. The balustrade of the balcony and the pilasters of the shop fronts will be of a Mooresque design carried out in glazed green faïence, the glaze being shaded to imitate malachite. The shop bays are marked off on the balcony by cupolas in green faïence, replicas on

a reduced scale of those which ornament the street frontages. At the junction of the two City Arcades from High Street and New Street near Union Passage the New Street section will be considerably widened out, with a block of four shops dividing the footway. A little farther towards New Street the glass roof will be carried to a height of 50ft., forming a large dome, with a kiosk under its centre. At the corner of Union Passage and Warwick Passage a triangular piece has been thrown into the public way, and a similar thing will be done where the New Street Arcade opens into the passage, so that the opening will exactly face that of the arcade from Union Street. All the shops will have basements, and under each arcade will run a subway for the delivery of goods and another in which all gas, electric light and other supply mains will be laid. The building erected from the designs of the late John Henry Chamberlain for Messrs. Chamberlain, King and Jones, in Union Street, has been undermined in order to form a basement 77ft. by 36ft. The heavy engineering work, as well as the buildings—which will include an extension of the Louvre backwards from High Street and its connection with the Midland Arcade—has been carried out by Mr. Edward John Charles, of Moseley. The architects are Messrs. Newton and Cheetham.

Lynn.—At its last meeting the Board of Guardians selected a scheme for a new infirmary. The Board had three plans before it:—No. 1 (the block scheme) providing for the erection of the infirmary as one large building, estimated to cost £8,200; No. 2 (the pavilion scheme) to erect the infirmary in three blocks—connected by corridors—one each for the men and women and the third for administrative purposes (accommodation of the nurses, &c.)—estimated to cost £8,700; and No. 3 providing for utilising the present building, with additions—estimated cost, £6,500. For Nos. 1 and 2 thirty-years loans would be granted; for No. 3 fifteen years. At the previous meeting the subject was under discussion, and a committee of the whole Board presented a report recommending the adoption of the pavilion scheme, but, by the casting vote of the chairman, the report was rejected. At this meeting the subject came up for consideration *de novo*, with two propositions concerning it on the agenda. The chairman, Mr. C. H. Ayre, moved:—"That the Board do now make a selection between the plans numbered 1 and 2, and that the architects be instructed forthwith to make detailed drawings, for the approval of the Local Government Board, of the plan which shall be selected." In reviewing the steps which had been taken in this matter, the chairman mentioned that Mr. Gordon Smith, the architect to the Local Government Board, who was consulted on the subject by a committee of this Board, told them that in having an infirmary of the design of plan No. 1 (like one at Basingstoke, which they had viewed), they would have one erected after modern principles and quite up to date. One thing that impressed the committee which visited Basingstoke very much was that there were large verandahs, measuring nearly 50ft. in length, on to which the patients could be taken to get the sun and air. The No. 2 scheme would provide for only half that length of verandah; also the buildings would be more expensive to erect and more costly for management. The Board seemed to be evenly divided for and against No. 2 plan, and there was a suggestion by Mr. Springall that plans Nos. 1 and 2 should be submitted to the Local Government Board for them to advise which was the more suitable. He (the chairman) was in favour of No. 1 scheme; but if No. 2 were adopted he would give the carrying-out of it his hearty support. Without taking any prejudiced part, he could not help thinking that, as between plans Nos. 1 and 2, for the purposes of an infirmary and as suiting the site No. 1 was preferable. If he had been a younger man he would have been inclined to join a party to pull down the present workhouse altogether. The valuable site would go far towards building a new workhouse and infirmary, and the Board would then have a more economical place, which would repay the outlay hand over hand. But he could not put the clock back.—Mr. E. Dunn seconded the proposition, and spoke in favour of No. 1 scheme, saying it was less costly than No. 2, and the expenses of management would be less. No. 1 scheme provided for a much more compact building; with No. 2 scheme they would run the risk of interfering with the rights and privileges of their neighbours.—Mr. Lock explained that after all there was not so much difference between Nos. 1 and 2. No. 2 scheme was really taking the one straight line of buildings in No. 1, and folding the wings so as to get a western and southern aspect for each building. But No. 1 plan took the Board into deep water, because if it were adopted the old building was doomed. No. 2 plan could be carried out in sections. There would be three blocks, and the westernmost could be built at once and attached to the old building by a temporary corridor. No. 1 plan was for a colossal building, stretching from east to west, and with a northern aspect along its whole length.—Mr. J. Hillen proposed as an amendment that plan No. 3 be considered as well as Nos. 1 and 2. He objected to Nos. 1 and 2 on the ground of economy. He suggested that they should add two wings to the present infirmary; they could be built at different times and each could be planned to point south. The great object in an infirmary was to get the maximum amount of light and heat. If the two wings were connected to the present building (which could be the nurses' dwelling) by corridors, they would have the pavilion scheme at a much less cost. Mr. Hillen's amendment, which was to ascertain whether No. 3 plan should come before the meeting, was put, and was rejected by 11 votes to 6.—Mr. R. F. Springall then proposed as an amendment:—"That the plans Nos. 1 and 2, together with any other documents considered necessary, be sent to the Local Government Board, and the advice of their architect asked as to which is the most suitable for this union, and that such advice when given be adopted by this Board." Messrs. Smith and Son, of Reading, the Board's architects, he said, had told the Board that they had been carrying out a series of progressive plans of infirmaries; and if Basingstoke infirmary was a good place Lynn would have something better. Messrs. Smith did not say that the cost of No. 2 plan would be £500 more than No. 1. They said the relative cost would be £500 more—or 6 per cent. more. The amendment was put to the meeting and rejected. Mr. Springall then moved another amendment:—"That this Board postpone the consideration of the plans for the proposed infirmary until the clerk to the Board can arrange for the architect to the Local Government Board, together with Messrs. Smith, of Reading, to meet the Board at a special meeting in order to give the Guardians their advice as to the plans in question," which was not seconded.—Mr. T. Green then proposed that the Board adopt No. 1 plan, which Mr. R. Dye seconded. Mr. W. Lock proposed that No. 2 plan be adopted, and this Mr. T. Green seconded. On a division No. 2 plan was adopted by 8 votes to 7.

Okehampton.—A new market building is now in course of erection on the site of the inconvenient premises which for nearly three-quarters of a century served the purpose of a butchers' market and corn stores. Occupying the whole of the space between the pannier market and technical schools the new structure will be 173ft. long, with an average width of 37ft. It is being built of local dressed stone relieved with white brick, Bath stone and granite. There will be two entrances in Dartmoor granite, with Bath stone pediment and trusses and massive iron gates. The floor of the market will be laid with cement concrete, and the roof supported by composite trusses of wood and iron. Ventilation will be secured by means of gable louvres towards Lodge Road and special ventilating turrets in the roof. To provide internal lighting the whole of the north side of the roof will be glazed for a length of 12ft. The stalls will be of wood and iron. The building has been designed for the Corporation by Mr. J. Archibald Lucas, of Exeter, and is being erected by Mr. Ball, of Okehampton. It will cost about £1,500, and the work is contracted to be finished by the end of September.

Portsmouth.—At the last meeting of the Town Council a report was submitted by the Libraries and Museum Committee, with reference to the new Technical Institute. They recommended the adoption of No. 3 sketch plan, prepared by the assessor, and that application be made to the Local Government Board for sanction to borrow the sum of £45,000, the estimated cost of the building. The amount was divided as follows: Institute, £30,000; library, £10,000; and examination hall, £5,000. Alderman Ward, who moved the adoption of the report, said that the committee had at first thought £30,000 would meet the requirements of the Municipal Institute, but the assessor stated it was impossible to put up a suitable building for that sum. The estimate for plan No. 2 was £43,000, and they asked for power to borrow £45,000. The additional accommodation for the library would make provision for 70,000 books instead of 40,000. Mr. Evans and Mr. Carpenter complained that the steps to the building projected into the roadway. Mr. Vernon-Inkpen said the assessor had been told he would have to get the steps within the limit of the boundary. Replying to a question, Alderman Ward said the large hall would be large enough to seat 250 to dinner—more than double the size of the Mayor's Banqueting Hall. The report was then put and carried.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Drains below Houses.

HULL.—JUSTICE writes: "A client buys a piece of land about 107ft. long on which to build seven good cottages. The land falls to such an extent that the drainage can only be obtained by draining with the land, which necessitates coming under the end house, as adjoining there is a gable end. There is a local by-law permitting a drain under a building if bedded in concrete and ventilated. This by-law was carried out on the plans, but these the Urban Council refuse to pass on the ground that by building six houses only or by building seven houses of less frontage the drainage could be effected without passing under any house. The Council was asked to reconsider the matter, but they decline to do so. We should like to know our position: should we apply to the Local Government Board, or build and occupy and let the Council take legal proceedings?"

I am of opinion that the construction put upon the by-law by the Council is correct.

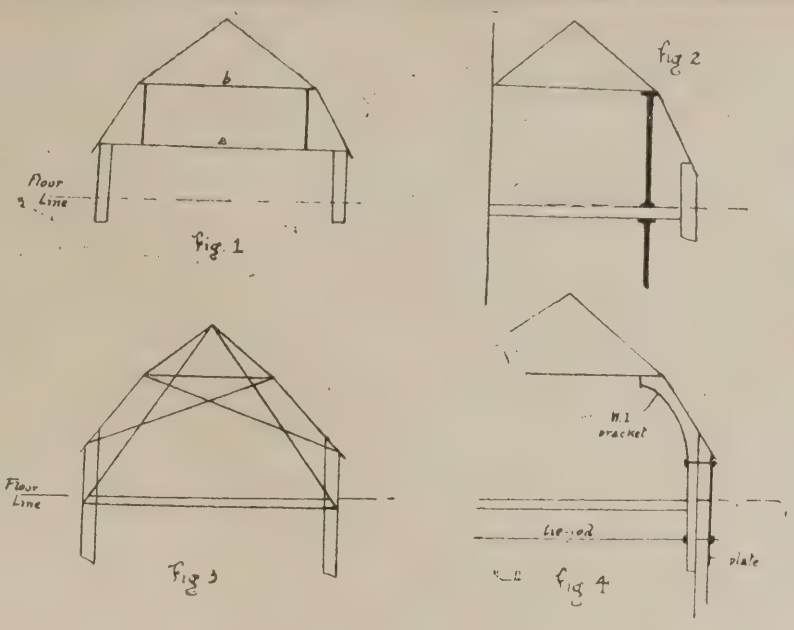
H. P. B.

How to become a Member of the Sanitary Institute.

ILFORD.—ENQUIRER writes: "I wish to become a member of the Sanitary Institute. Can you recommend me what books to study or tell me the way to proceed? I am managing foreman to a builder, and am anxious to become somewhat proficient in sanitary work: I have done plenty of this kind of work, but this will not entitle me to be enrolled."

The examination in "practical sanitary science" requires a knowledge of ventilation, drainage, sewage disposal and water supply. The principal provisions of the Model By-laws and a few of the more important Public Health Acts should also be carefully noted. Further particulars may be obtained on application to the Secretary, Sanitary Institute, Parkes Museum, Margaret Street, London, W. The following works are recommended for study:—Reid's "Practical Sanitation" (Griffin and Co.), Coleman's "Sanitary House Drainage" (Spon),

Moore's "Sanitary Engineering" (Batsford), and Knight's "Annotated Model By-laws."



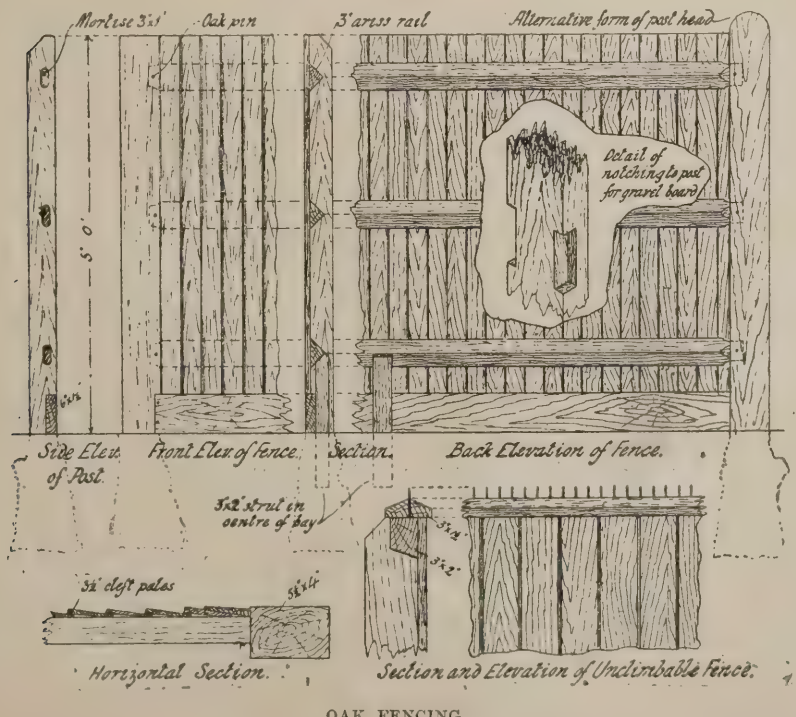
T. E. C.

Oak Fencing.

AYR, N.B.—H. writes: "I shall be glad if you can give me any information about split oak fencing—the scantling of the materials both in laths and in posts and rails forming the framework of the fence. Also where the materials can most readily be obtained. So far as I can learn this class of fencing is not obtainable in Scotland."

The accompanying illustrations will serve to show in a general manner the details of construction of oak park fencing, as usually erected in the South of England. As will be seen, the details apply to a fence 5ft. in height, and they may be taken as approximately correct for any height in reason, the only reservation necessary being that for a higher fence the posts may be proportionately stouter and should have longer butts, so as to be able to stand the increased wind pressure. It is usual to char and tar (gas) the butts before the posts are fixed and to leave the fence undressed in any way; but sometimes, as when fixed as the front boundary fence of a residence, the posts are painted white, whilst the remainder of the wood is dressed with Stockholm tar or boiled oil. Although the gravel board is a customary provision it is sometimes omitted, and a brick plinth substituted; sometimes there is no substitution, but when the pales are fixed close to the ground they are much more liable to premature decay. The rails are either sawn or cleft, the former being preferable as making the alignment better; sawn pales are now being brought into use, probably on account of cheapness, there being less waste than when the pales are cleft. Pales are made of different widths, and in best work are fixed with copper nails, though zinc and iron nails are also employed. The fence from which the details are taken is fixed in 9ft. bays, and the horizontal section shows how each bay is finished off by a pale fixed in reverse position. The top rail is fixed about 4in. below the top of the fence, but when it is desired to render the fence unclimbable the top rail, of different section as shown, is fixed flush with the top and covered by a weathered capping, through which, from the under side, ordinary steel cut nails about 3½in. long are driven. Wrought nails with sharper points would be an improvement, though, of course, the cost would be higher. A list of firms supplying the fencing or the materials therefor appeared on p. 392 of the BUILDERS' JOURNAL for January 24th last.

H. E.



HEAD ROOM ON FIRST FLOOR.

Head Room on First Floor.

COVENTRY.—AN OLD SUBSCRIBER writes: "A client of mine wishes to erect a two-storey factory as per sketch (not reproduced). He is restricted in carrying up the wall facing the passage to a height of 13ft. (right of light). What construction of roof would it be necessary to adopt so as to obtain, say, 7ft. or 8ft. head room on the first floor? You will notice that the distance from the first floor to the eaves is 3ft. only. The roof may be any shape so long as the head room is obtained."

In answering this query it is presumed that it is impossible to arrange with the adjoining proprietor for an extension of the height to which our correspondent's client may carry up his wall. It is sometimes possible in these cases to give a *quid pro quo* somewhere else and so compromise the matter. It should also be remembered that the roof of the proposed new factory if unduly high may possibly itself cause an injurious loss of light to the adjoining owner, though if the angle of the new roof be kept below 45 deg. this injury is hardly likely to occur. The various methods of evading the difficulty mentioned by "Old Subscriber" which occur to me are:—(1) Sink the level of the bottom floor 3ft. or 4ft. below the present ground line and so obtain a lower level for the upper floor; then put any ordinary roof truss on the top of the outer wall, which will still be only 13ft. in total height. (2) Use an ordinary "Mansard" roof truss as shown in outline in Fig. 1., or, if preferred, leave out the lower tie-beam, *a*, and carry the ends of the upper tie-beam, *b*, on upright timbers or light iron columns, as sketched in Fig. 2. It will be noticed these columns form an obstruction in the ground floor room as well as the upper. (3) Or the floor joists may be utilised in the place of tie-beams and a construction such as that sketched in Fig. 3 adopted. Iron trusses would probably occupy the least space and so occasion the minimum of obstruction in the upper storey. It would, of course, be necessary to roof light this portion of the building, though perhaps windows may also be placed in the gable ends. (4) In place of roof trusses, as previously described, a wrought-iron bracket, as shown in Fig. 4, may be employed to carry the roof tie, all its outer edges being of T section connected by a web in exactly the same way as an ordinary rolled joist, save that this bracket is curved, whereas a joist would be straight. An iron plate may be placed on the outer side of the main wall and each bracket secured in its upper portion by a bolt through the wall. The lower extremities would be tied by a round iron rod at about 1ft. 6in. or 2ft. below the ceiling line of the room below.

G. S. M.

OAK FENCING.

R.I.B.A. Studentships and Prizes.

EDINBURGH.—E. J. K. writes:—"Where can I obtain a list of subjects and details of competitions for the R.I.B.A. studentships?"

A list of the subjects of these competitions appeared on page 64 of our issue for February 28th last. Full particulars are given in a pamphlet issued by the R.I.B.A. at its offices, No. 9 Conduit Street, Regent Street, W., price 3d.

Surveying and Sanitary Notes.

New Park for Eastbourne.—The Eastbourne Town Council has decided to purchase a park of 82 acres from Mr. Freeman Thomas. The scheme includes a low-level drive to the Willingdon Estate, and the total expenditure on it will be £12,500.

Dungarvan Main Drainage Scheme.—The Dungarvan Urban District Council have retained the services of Mr. W. Kaye Parry, M.Inst.C.E., of Messrs. Kaye Parry and Ross, civil engineers, of Dublin and Westminster, as consulting engineer in connection with their proposed main drainage scheme.

The Haymarket and Lower Regent Street, London, after a lapse of a few years only, are again being re-paved with wood—Alcott's redgum. This wood is of a khaki colour, and though softer than hardwood is extremely durable. It can be laid with great rapidity and requires no creosoting or tarring.

Changes around Windsor.—A river-side promenade is being constructed to remove the one defect on the Windsor bank and a new road from Thames Street in the direction of the promenade is assuming definite shape. Plans have also been drawn for laying out the Goswell Meadow, in the rear of the promenade, as gardens, with kiosk and bandstand. It is expected that the improvements will be completed by next summer.

The Ventilation of the Bradford Kirkgate Market is being improved by the fixing of a large sun fan. This is a matter which has long stood in need of attention. The market is becoming increasingly popular, and at times, when the press of visitors is heaviest—Saturday nights, for instance—the atmosphere is so trying that many people who are not quite strong find they must keep out of the building because the conditions are unendurable. To an appreciable extent business has been lost from this cause.

Dewsbury Improvement Scheme.—It is proposed to make a new road through Crow Nest Park and the Old Borough Park. The estimated cost of carrying out the scheme is £9,857, but against this sum there would be the amounts received for land sold. It is proposed to sell a great portion of the Borough Park, as well as a strip taken off Crow Nest, for building purposes. The matter has been under consideration for some time past, but the Council has now approved the principle of the scheme, and they have requested their Parks Committee to work out details and to submit them.

Shrewsbury Sewage Scheme: Nearing Completion.—The carrying-out of the elaborate scheme of sewerage and sewage disposal adopted by the Shrewsbury Town Council in the early part of the year 1896 has taken a very much longer time than anybody anticipated when the first contract was let, and there are some members of the Corporation so pessimistic in reference to it that they do not hope to see its completion for a long time to come. There are not wanting signs, however, that the end is at last within measurable distance. Part of the scheme is now actually in operation, and, the engineers say, is working in an excellent manner.

The Historic Pantiles at Tunbridge Wells—in regard to the control of which there has been considerable litigation between the Lady of the Manor and the Corporation—will, it is expected, shortly come under the absolute management of the Town Council. Preparations are being made to light the quaint linden walk with electricity, and it is also proposed to erect a large fountain, to be supplied by the chalybeate springs. Owing to the continued friction between the manorial authorities and the Town Council in the past, the Pantiles promenade has been much neglected, and considerable satisfaction is felt, not only by the inhabitants, but by the many visitors to the town, that steps are about to be taken to put the resort in good condition without spoiling its old-world appearance.

Sanitary Inspectors' Conference.—The members of the National Union of Sanitary Inspectors assembled at Leamington on Thursday last, for the fourth annual conference and thirteenth annual meeting, which was held under the chairmanship of Mr. William Bland, of Barton and Wimston, in the absence of Sir Francis Powell, M.P., president, who is in Germany. The union was accorded a hearty welcome to the town. The official reception by the Mayor and Corporation took place on Friday. Lord Leigh invited the inspectors to visit Stoneleigh Abbey, and Lord Algernon Percy gave permission for a visit to Piers Gaveston's monument. Arrangements were also made for visits to Warwick Castle, Stratford-on-Avon, Kenilworth Castle, and other historic places in the neighbourhood.

East Pentire Estate, Newquay.—The second sale of plots on this freehold building estate took place recently. Since the first sale the vendors have made new roads and laid the sewers and water mains, and altogether the estate presents a most attractive appearance. The five plots facing the sea were not sold, but twenty other lots were disposed of, realising £3,401. Mr. J. Ennor, of Newquay, is the surveyor.

New Parks for Leeds —Leeds is to have two new parks. The City Property Committee have agreed to acquire Harehills Park Estate for £35,000, in the Chapeltown District, the area being 32 acres, and a site in Harehills Lane for £14,000, subject to the approval of the City Council. With the opening of new parks the Corporation are gradually abolishing the slums of Leeds, and it was recently announced that the Dusty Miller public-house in East Street had been bought for a street improvement.

Masters and Men.

Bristol Association of Clerks of Works and Builders' Foremen visited the seat of Sir W. H. Wills, M.P., at Blagdon, recently. On arrival at Blagdon the party were met by Mr. E. Blizzard and Mr. Edwards, bailiff to Sir W. H. Wills, and were conducted over the estate and grounds. After a ramble through the woods, the party were entertained to luncheon, the chair being taken by Mr. E. Blizzard. The party afterwards visited the church, the tower of which has been recently restored by Sir W. H. Wills, and thence proceeded to view the new waterworks reservoir in the valley.

Threatened Strike of Builders' Labourers in Cork.—At present the minimum weekly rate of pay is 16s., but in some instances a number of the men receive 17s., and others 18s. The men now ask the employers to concede an increase of 2s., the first advance to take effect on September 1st, and the second on March 1st next. The employers, while declining to accede to the September increase of pay, have agreed to give the 1s. advance on the standard rate of wages in March next. This determination has caused much dissatisfaction amongst the employees, who have decided that a general strike shall take place next Monday. This step has yet to be considered by the Cork United Trades Council.

The Building Trade Dispute in Ipswich has been settled. The terms of the agreement arrived at between the employers and men at the meeting on August 17th are as follow:—"That a new rule be added to those accepted and known as being drawn on the lines of the carpenters' rules, viz., 'That the members of the Master Builders' Association agree not to employ labourers to do bricklayers' work'; and further that the secretary of O.B.S. furnish that association with a fair copy of the aforesaid rules, embodying the statement that the agreement entered into is binding on both parties for three years, from March 25th, 1901; that the wages hitherto agreed upon be paid—7½d. per hour from August 20th, and an extra ½d. per hour be paid from March 25th, 1901."

A Carpenter's Custom.—Before Mr. Slade at Southwark police-court, last week, a carpenter complained that his employer refused to pay him when he "knocked off" work. The clerk asked, "When was that?" "This morning before breakfast. I gave him an hour's notice, and, according to our trade rules, I was entitled to be paid at once," was the answer. "Can't you go on Saturday for your money?" "No, it is our rule to be paid 'on the nail.'" "But is it worth your while to take out a summons, rather than wait till Saturday?" "I think so, because it is the custom of our trade." "In all probability he will pay you on Saturday." "Perhaps not. He seems to me to be a rather shaky customer." Mr. Slade: "How much does he owe you?" "Sixteen hours at 10½d. an hour." "Very well. Take your summons."

Keystones.

A new Hotel at Whitby is to be erected, at a cost of £50,000.

The Central London Railway Stations are to have flats and offices built over them.

For new Offices for the Cuckfield Rural Council at Hayward's Heath £850 has been borrowed.

The Death of Mr. Thomas Faed, R.A., which occurred recently, will not cause a vacancy, as he retired from the Academy in 1893.

A Marble Bust of Mr. Gladstone was unveiled at Stirling in the Hall of Heroes of the National Wallace Memorial last week.

A new Infectious Diseases Hospital for Bo'ness and Grangemouth is proposed to be erected at a place convenient to both towns.

Electrical Treatment for Lead-Poisoning.—The North Staffordshire Infirmary has been provided with electrical apparatus for the treatment of lead-poisoning.

The Lunatic Ward of St. George's Workhouse, Mint Street, E.C., is being altered and repaired under the superintendence of Mr. G. D. Stevenson, architect, 13 and 14 King Street, Cheapside, E.C.

St. George's Vestry and Electric Lighting.—On Friday last a special vestry meeting of the parish of St. George's, Hanover Square, W., considered the proposed electric lighting of the streets at a cost of £17,000 annually for a term of thirty-one years. After discussion the motion was adopted.

A new Sailors' Home at Chatham is to be erected. The Admiralty have expressed their willingness to contribute a sum not exceeding £5,000. The grant will be contingent upon the condition that £1 is raised by voluntary donations for every £1 provided from public money. An immediate start is to be made in building the first section of the home.

A new Parish Hall at Aspley Guise is to be built. The building will contain a hall 28ft. by 54ft., including a platform; a council chamber 16ft. by 12ft., with a deed room and a reading room 16ft. by 18ft. The building is estimated to cost £1,500, but it is expected that a further sum of about £500 will be required for seats, fixtures, lavatories, &c.

The new Essex Museum of Natural History at Stratford, which fortunately escaped the fire that destroyed the adjoining Technical Institute a few months ago, is now in course of arrangement, and will probably be opened on October 20th. The Institute buildings are being repaired, and will, it is thought, be ready for reopening in six or eight months' time.

High-priced Chairs.—The Local Government Board has objected to the Hunslet Guardians at Leeds proposing to furnish its board room with eighteen oaken chairs, at a total cost of about £60. The defence of the Guardians is that what they propose is simply to buy chairs to match others bought some years ago, and they mean to carry out their proposal.

Light—and the Want of it.—A dispute between Alfreton Council (Derbyshire) and the local gas company as to the price of gas for street lighting has resulted in the town being in darkness at night. A town's meeting was called by tradesmen to force the Council to agree to the gas company's terms, but an overwhelming majority was in favour of the action of the Council.

The Excavations at Wilderspool, near Warrington, on the site of the old Roman city there, are progressing favourably. Chief among the discoveries hitherto made have been a number of hypocausts in varying stages of preservation. The tenth of these was recently brought to light and found in a better state of preservation than any of the others. The over arch, which in the case of each of the nine previously unearthed had unfortunately collapsed, was in this instance found to be intact, and there was also the accompanying floor of the chamber which the furnace originally heated.

An Isolation Hospital for Thorne is proposed to be erected at a cost of £2,000 by the Thorne Parish Council.

A Memorial to Lord Russell is to be erected in the new Westminster Cathedral, if Cardinal Vaughan will give permission.

The Pagoda at Kew.—Mr. J. Landfear Lucas has called attention to the refusal of permission to the public to ascend this Pagoda, in grounds which are maintained by an annual Parliamentary grant of about £20,000.

Tramway Schemes for Essex.—The West Ham Corporation, the East Ham and Ilford District Councils, have each under consideration schemes of electric traction. There is to be a through connection that will give travelling facilities over a thickly-populated area of that portion of Essex.

The Large Lake in Brockwell Park has been entirely lined with hydraulic cement, and the depth adapted to inexpert swimmers, the gradients being three, four and six feet, with a dive of seven feet. There is a shed for undressing and dressing. Bathing, as formerly, will be restricted to the early hours of the morning.

A Reredos at St. Clement's Church, Barkerend Road, Bradford, has been erected. The material with which it is wrought is Venetian glass mosaic, manufactured by the Venice and Murano Glass Company, Italy and London. The chancel windows are also included in the scheme of decoration now completed. These windows are the work of Mr. E. C. Kemp, of London. The pews in the church have been re-stained and varnished.

A Plaster Model of Lord Leighton's Memorial Bust has been placed in St. Paul's. Seated figures representing Sculpture and Painting are placed at the east and west of the tablet, which bears the following inscription:—"To the memory of Frederick, Lord Leighton of Stretton, painter, sculptor, seventh President of the Society of Arts, this monument is erected by his many friends and admirers. Born Dec. 3, 1830, died Jan. 25, 1896. He lies buried in the crypt of this Cathedral."

St. Paul's Church, Barrow, has just had a new organ and a vestry room added. The work of building the new vestry and organ chamber has been done by Messrs. Thoms and Son, of Grange, and the organ has been built by Messrs. Alex. Young and Sons, of Manchester, to the order of Councillor James Thompson, of Monks Croft. The case, which is of oak, was designed by Messrs. Austin and Paley, who also designed the new vestry, &c.

The Leeds Public Dispensary is to be extended by the erection of a new building, the opportunity being afforded by the widening of North Street. The street improvement encroaches to the extent of 28ft. upon the existing dispensary, and, the building being now too small for the requirements, such a serious curtailment cannot be contemplated. An suitable site on Hartley Hill has been secured in the immediate vicinity, and the erection of a new dispensary is to be proceeded with at as early a date as possible. The ground selected comprises about 1,470 square yards; it has a frontage of 80ft. to North Street, and is open to Hartley Hill on the south side and to Back Brunswick Street on the north.

"The Temple of Heaven," at Peking, lies in the southern quarter, in the "Chinese City," about two and a half miles from the Legations and Imperial Palace. The extensive grounds of the temple are surrounded by walls. Within the enclosure stand two temples. The principal one is composed of a flat, marble-paved altar, surrounded and supported by three circular marble terraces and flights of steps. Above this platform stands a large edifice with three roofs, all of bright blue glazed tiles, representing a symbol of Heaven. The second altar, which stands apart, is very similar—the terraces and steps being almost a counterpart—with the exception that there is no triple-roofed building surmounting it. These buildings are among the most interesting religious structures of China. The stones, slabs, balustrades, steps and decorations are all ranged in symbolical numbers.

Firebricks from Dredgings.—It is stated that a Suffolk brickmaking firm, after experimenting with the dredgings of the River Stour, finds that excellent firebricks can be made from them.

Montevideo Port Tenders.—The tenders for the construction of the port at Montevideo have been opened. Three great British contracting firms have tendered, the lowest being £2,600,000, and the highest £3,000,000. Three French houses also sent in tenders.

Views and Reviews.

The Drawing of Ornament.

This booklet consists of twenty-four examples of relief ornament and sixty-eight analytical diagrams of construction printed on pages 11in. by 8in., with a few hints and directions for the drawing of them. The examples of ornament are Greek, Arabian, Gothic, Roman, Byzantine, and Renaissance, and are presumably photographic reproductions of the casts so familiar to all art students—the Greek fret ornament, the Gothic quatrefoil from a diaper pattern, the Roman rosette or the beautiful acanthus, for instances. Above each example are the diagrams showing how the student is to proceed, how he is to obtain his governing lines, and how he is to work out the subordinate parts. The hints given are of the most elementary character—in fact, too elementary—and contain only two remarks that are worth noticing: one is that the analytical diagrams are not to be copied, but only used as suggestions; the other "that accuracy of form and freedom of line should be secured before attempting finish." It is a common failing among students, particularly those studying the antique, to be giving their attention to detail when the all-important main lines are wrong. Having these examples before the eye reminds us of what should be the true use of freehand drawing and light and shade. It is not to produce copies as copies—these are worthless—but as a mean to an end, to train the hand and eye to better things. This is the only legitimate reason for copying, yet cases are numerous of art students working night after night on, say, a piece of stump work, while all the while they would be improving themselves much more if, instead of producing one laborious drawing, they had drawn half a dozen less highly finished ones, and so acquired a greater proficiency. For obtaining a freer hand and a feeling for design, therefore, the examples in the book under notice can be recommended for home study; but do not let them be copied and copied and copied for the sake of simply producing copies.

"Freehand Drawing of Ornament," by John Carroll. Burns and Oates, Limited, 28 Orchard Street, London, W. Price 1s. 6d.

LONDON'S CONGESTED STREETS.

A PLAN for relieving the present congested state of the London streets has been formulated by Messrs. W. Rose Smith and Mr. H. Hoyne, Fox. Briefly it involves the construction of a great central terminus in the neighbourhood of Piccadilly Circus, connected by about forty tunnels with the termini of the several London railways. In addition to the passenger traffic it is proposed that the market produce should be loaded into trucks, brought up to town on the present railway lines, and then dropped by means of lifts down to the underground lines referred to. From the Piccadilly centre the trucks would be taken to the markets they were intended for. The promoters claim that this would do away with half the congestion of the London streets. Nearly two thousand million tons of food a year, at present dragged through the crowded streets, would be swiftly and invisibly transferred from one corner of London to another—and London streets would be free for pedestrians and noiseless electric-motor vehicles.

New Companies.

Thiersant, Limited.

This company was registered on August 15 h, with a capital of £500 in £1 shares to acquire, work and turn to account any inventions relating to acetylene gas or otherwise.

Clayton West Freeholders' Building Co., Ltd.

This company was registered on August 14th with a capital of £2,360 in £10 shares to take over the business of the Clayton West Freeholders' Building Company. Registered office: 9 Station Street, Huddersfield.

Kennedy Brick Machine Company, Limited.

This company was registered on August 18th with a capital of £3,700 in £1 shares to acquire and turn to account any patents, inventions, contracts or rights. The first directors (to number not more than five) are to be appointed by the subscribers.

Walcot, Limited.

This company was registered on August 10th with a capital of £1,000 in £1 shares to carry on the business of timber growers, brokers and merchants, sawmill proprietors, &c. H. T. Walcot is permanent managing director, and may appoint other directors.

Improved Tenements Association, Limited.

This company was registered on August 16th with a capital of £2,000 in £10 shares to acquire and deal with lands, houses, buildings and property in London or elsewhere, and to carry on the business of builders, contractors, &c. Registered office: 10 Drapers' Gardens, E.C.

North Kent Land Company, Limited.

This company was registered on August 16th with a capital of £30,000 in £1 shares to carry on the business of land and property owners, builders, &c. The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers. Registered office: 139 Queen Victoria Street, E.C.

Panel Decorations Company, Limited.

This company was registered on August 13th with a capital of £2,000 in £1 shares to carry on the business of cabinet makers, furnishers, decorators, dealers in panels and pictures, &c. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers.

Rogers and Gowlett, Limited.

This company was registered on August 16th with a capital of £10,000 in £1 shares to acquire the business carried on by Rogers Brothers at Watford, and to carry on the business of ironmongers, electricians, hot-water engineers, &c. The first directors (to number two) are J. Rogers and P. Gowlett (both permanent). Registered office: 61 High Street, Watford, Hertfordshire.

Perfect Portland Cement Corporation, Limited.

This company was registered on July 23 h with a capital of £200,000 in £1 shares, to acquire certain lands, quarries, &c, containing marl, coprolites, clay, sand, brick, earth and other minerals, situate at Swaffham, Bulbeck, and Bottisham, Cambridgeshire; and generally to carry on the businesses of cement hydraulic lime, clay, sand, stone and manure merchants, as road and street contractors, colliery proprietors, and as manufacturers of and dealers in materials used in connection with the said businesses; to erect and maintain workmen's cottages, offices, storehouses, or other buildings, machinery, plant, tools, fixtures, ships, steamers, carriages, electrical engines, steam engines, tram and motor cars. The first directors (of whom there shall be not less than three nor more than twelve) are J. Douglas, F. B. Thacray, J. W. Knights, S. Brighouse, and S. A. Bartlett.

Joseph Benton and Son, Limited.

This company was registered on August 14th with a capital of £10,000 in £5 shares to acquire the business carried on by J. R. Benton at Hope Street, Great Grimsby, as Joseph Benton and Son, and to carry on the business of timber merchants, builders, contractors, sawmill proprietors, &c. J. R. Benton is governing director for life. Registered office: Reliance Works, Hope Street, Great Grimsby.

Carlow Gas Company, Limited.

This company has been registered in Ireland with a capital of £5,500 in 1,100 shares of £5 each to acquire and carry on the business of the Carlow Gas Light Joint-Stock Company, Limited, which was constituted in 1846. The first directors (to be not less than three nor more than six) are Messrs. Joseph C. Deighton (chairman), D. Shackleton, Daniel T. McGrath, Edward Duggan and Edward Morris. Registered office: Montgomery Street, Carlow.

City of Sheffield Property Company, Limited.

This company was registered on August 20th with a capital of £5,000 in £10 shares to acquire and deal in real and personal property of all kinds, to advance or lend money on any security, and to carry on the business of landowners, builders, contractors, financiers, &c. The first directors (to number not less than three nor more than five) are J. Parker, R. Craig, H. S. Barker and J. T. Hickson.

Diamond Wall Cement Company, Limited.

This company was registered on August 17th with a capital of £5,000 in £1 shares to acquire and turn to account a concession granted to E. W. Bell by an American company for manufacturing and selling in the United Kingdom a new material for plastering, known as Diamond Wall Cement. The first directors (to number not less than two nor more than five) are C. A. Dalton, B. H. Johnson and E. W. Bell.

Page, Calnan and Company, Limited.

This company was registered on August 4th with a capital of £50,000 in £10 shares (of which 2,400 are six per cent. cumulative preference, 2,500 ordinary and 100 founders') to acquire the business of timber merchants carried on at Barking, Hornchurch, Upton Park and Plaistow, Essex, and at 185 Cannon Street Road and 159–161 Commercial Road, Middlesex, by J. Calnan, under the style or firm of Page, Calnan and Co., and, generally, to carry on the businesses of timber and joinery merchants, importers and exporters, builders' merchants, mechanical, electrical, water and sanitary engineers, carpenters, decorators, shipowners, carriers, &c.; tug-owners, wharfingers, contractors, plumbers, painters, builders, marble-workers, papermakers and printers, stove, grate and range manufacturers, &c. The first directors (of whom there shall be not less than three nor more than seven) are J. Calnan, W. Davis and W. T. Taylor. Registered office: Town Quay Wharf, Barking.

Cheadle and Gatley Cemetery Competition.—At the last meeting of the District Council plans, reports and estimates of the projected new cemetery were examined and considered. The plans under motto "Semper Paratus" were adopted, and the first prize of £40 was awarded to the author. The second prize of £20 was awarded to the author of the plans submitted under the motto of "Experientia." It was resolved to divide the proposed cemetery into consecrated and unconsecrated portions. "On reading the names of the successful draughtsmen it transpired that Mr. Geoffrey H. Brady, son of Mr. W. H. Brady, of Stockport, and nephew of the Chairman of the Council, was the successful competitor, and that the authors of the plans 'Experientia,' the winners of the second prize, were Messrs. Barton and Percival, of Ashton-under-Lyne."

The New Building for the London Chamber of Commerce is to be built by a company which has now been registered at Somerset House under the title of the London Chamber of Commerce Building Company, Limited. The company has not yet secured a site for the new building.

Defacing a Picture.—One of Ford Madox Brown's famous mural paintings in the Manchester Town Hall has been wantonly defaced by some unknown person with black and red pencil marks. The Town Hall Committee has offered a reward of £50 for the apprehension of the offender. It is believed that the marks can be obliterated without damaging the picture.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

BRIGHTON.—For the execution of wood paving works for the Corporation. Mr. F. J. C. May, C.E., Town Hall, Brighton:—

COMING EVENTS.

Saturday, September 1.
ARCHITECTURAL ASSOCIATION.—Sixth summer visit to Colney Chapel Convent, St. Albans.

Monday, September 3.
TRADES UNION CONGRESS at Huddersfield.

Wednesday, September 5.
BRITISH ASSOCIATION (Meeting at Bradford. First Day).—Presidential address by Sir W. Turner, F.R.S., 8.30 p.m.

Thursday, September 6.
BRITISH ASSOCIATION.—Meeting at Bradford (second day). Sectional meetings. Soirée in St. George's Hall at 8.30 p.m.

Friday, September 7.
BRITISH ASSOCIATION.—Meeting at Bradford (third day). Sectional meetings. Professor Gotch, F.R.S., on "Animal Electricity," at 8.30 p.m.

Saturday, September 8.
BRITISH ASSOCIATION.—Meeting at Bradford (fourth day). Sectional meetings. Excursions to places of interest in the neighbourhood.
NORTHERN ARCHITECTURAL ASSOCIATION.—Visit to St. Columba's Church, Sunderland.

Monday, September 10.
BRITISH ASSOCIATION.—Meeting at Bradford (fifth day). Sectional meetings. Professor W. Stroud, D.Sc., on "Range Finders," at 8.30 p.m.

Tuesday, September 11.
BRITISH ASSOCIATION.—Meeting at Bradford (sixth day). Sectional meetings. Soirée in St. George's Hall at 8.30 p.m.

Wednesday, September 12.
BRITISH ASSOCIATION.—Meeting at Bradford (seventh day). Concluding general meeting at 2.30 p.m.
INSTITUTE OF SANITARY ENGINEERS.—Meetings of Examination and Literary Committee at 2.30 p.m., General Purposes and Finance Committee at 3.30 p.m., Election Committee at 5 p.m., and members' sessional meeting at 7 p.m.

Thursday, September 13.
BRITISH ASSOCIATION.—Meeting at Bradford (eighth and last day). Excursions to places of interest in the neighbourhood.

Tuesday, September 18.
IRON AND STEEL INSTITUTE.—Autumn Meeting begins in Paris.

Tuesday, September 25.
CHURCH CONGRESS.—Meeting at Newcastle (first day).

Wednesday, September 26.
CHURCH CONGRESS.—Meeting at Newcastle (second day).

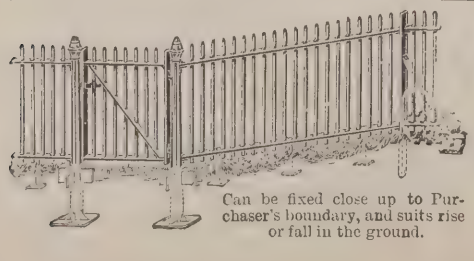
Thursday, September 27.
CHURCH CONGRESS.—Meeting at Newcastle (third day).

Friday, September 28.
CHURCH CONGRESS.—Meeting at Newcastle (fourth and last day).

CONTRACTS OPEN.

MANSFIELD SCHOOL BOARD.
TO BUILDERS AND CONTRACTORS.

Persons desirous of TENDERING for the ERECTION and COMPLETION of NEW SCHOOLS, situate at Pleasley Hill, near Mansfield, may see plans and specification, and obtain quantities, on payment of the sum of £3 3s. (which will be returned on receipt of a bonâ-fide Tender and the return of the documents), on application at the Offices of Messrs. VALLANCE & WESTWICK, Architects, White Hart Chambers, Mansfield.



The standard rate of wages must be paid by the successful contractor.

Tenders to be sent by post in the envelope provided for the purpose to the undersigned, on or before the 1st day of OCTOBER next.

The lowest or any Tender will not necessarily be accepted.

J. HARROP-WHITE,
Clerk to the School Board.

Bank Chambers, Market Place, Mansfield,
August 1900.

Can be fixed close up to Purchaser's boundary, and suits rise or fall in the ground.

BAYLISS JONES & BAYLISS'
NEW PATENT
SELF-ADJUSTING ROUND-BAR
RAILING (No. 2740),
Is, we believe, the cheapest in the market.
ILLUSTRATED CATALOGUE OF ALL KINDS OF HURDLES, FENCING, GATES, &c., FREE.
VICTORIA WORKS, WOLVERHAMPTON.
LONDON OFFICES AND SHOW ROOMS—139 & 141, CANNON STREET, E.C.

ROOFING SLATES:
Velinheli, Penrhyn, and Westmoreland.
SLATE SLAB GOODS:
Both Plain and Enamelled.
ALFRED CARTER & CO., LIVERPOOL.

EFFINGHAM HOUSE, ARUNDEL STREET, STRAND, W.C.

An Architectural Causerie.

"Palatial."

THERE is no phrase that more frequently meets the eye in the popular press than "a palatial building." It seems to indicate a sort of standard of magnificence, and to the mass of unobservant persons stands in place of description. It should not pass without comment, however, for it gives us an insight of the popular mind and explains to some extent the mushroom growth of bad design and bad building in the metropolis and elsewhere. "Palace" is a word with a history. Before the time of Romulus, a rustic divinity named Pales figured in the worship of Central Italy, and gave the name to the Palatine Hill, the site of infant Rome: his feast was kept on the "birthday" of the city, the 21st of April. Here in due time arose great villas and eventually the residence or *Palatium* of the Cæsars; this, rebuilt and extended by Nero, became his Golden House, in which he said "he was at last lodged as a man should be." The word was generally used in the plural by Roman writers, possibly because it fitted their verses better than the singular: in Christian times it was applied to the residence of a bishop, though, according to some authorities, only when placed within his cathedral city: later popular custom has caused a wide divergence in its use. We find it applied to civic buildings, to residences of governors, magistrates and others all over Europe: it is most generally used in Italy, the land of its birth, where, indeed, it is given to the private residence of any important individual, provided that the whole building be his. Its popular uses are many; "*e in Palazzo*," for instance, means in the case of a barrister that he is in court.

If "palace" has been popularised, its adjective "palatial" has been degraded. Popular admiration of buildings is largely governed by three things—great size, great apparent costliness, and great elaboration of detail. To the palatial idea, therefore, we may trace the lavish display of polished granite and plate glass, of mosaic and marble in places where good taste would forbid their use; the multiplication of materials and general confusion of designs, the *style tourmenté*, as it is called in France; the total disregard of harmony. The most extraordinary examples of "palatial" vulgarity may be seen in and about the theatrical region of mid-London, in restaurants and places of amusement. In the cafés, now so numerous, which the Italian-Swiss colony has set up, the decoration consists of several systems upon a single wall. The effect of mirrors (partly obscured by elaborate painted flowers and foliage), red velvet, panelling, glazed tiles, carving, painted ceiling and "electroliers," is bewildering; it is impossible for the eye to find an inch of restful surface. In luncheon bars the same idea prevails of crowding as many styles of ornament upon the walls as the place can hold. A curious example of this may be seen in the treatment of the iron pillars now so general: next the ground they are encircled with polished mahogany, then with some kind of enamelling, then with velvet, and finally with a band of gilded metal. Exteriors, too, commencing with polished granite and running upwards through red brick, rubble, half-timber (or its imitation), white freestone, terra-cotta and gilded metal, are not at all uncommon, whilst vast gilded letters higher than a man project from the front and proclaim the purpose of the structure. In more important buildings, where some of the restraints of architectural decency are still observed, the ill-effects of the perverted palatial theory may be traced in gloomy halls and comfortless rooms and passages; designs which aim at grandeur and succeed in being dreary.

J. C. P.

THE OLD "SWAN" INN, ATHERSTONE. DRAWN BY FREDERICK J. BARNISH.

Municipalities as Patrons.

THERE was a time when patronage of literature and the arts was in the hands of the wealthy few. Power wielded in this fashion by vain and capricious plutocrats was good for neither the arts nor those who practised them, and the fulsome flattery to which the *literati* of that happily bygone era found it possible to stoop caused the flattered to rank themselves little lower than the gods. We all have heard how Dr. Johnson was treated with a contemptuous indifference by that arch-patron of his day, the Earl of Chesterfield, and how Johnson repaid those affronts with stinging satire; but literature has long been enfranchised, and if the arts cannot ever be raised to the same terms of independence, at least modern times have seen the coming of another patron besides the individual, and in the appearance of our great municipalities as collectors in trust for the ratepayers we have a new and a promising factor which should at least give as great a spur to the imagination of artists as when bidden to work for the undistinguished individual. In architecture, also, as in those other departments, the coming patron (even if it has not already come into power) is the Municipality, and it should be easily possible to design and build for our cities and towns, great and small, manufacturing or residential, in a more dignified and inspired way than for merely private uses. There is, or should be, something in town halls or municipal building to touch the imagination and to prefigure the power that nowadays lies in the hands of those bodies, representative of the sovereign people. Whether the people—i.e., the ratepayers—exercise their sovereignty is another matter which need not arrest one's imaginative Pegasus in full flight. A thousand years of history, of strenuous endeavour, of invention, of struggles for religious, for individual and corporate liberty, are the portion of many of our towns; and if the man descended from an ancient and distinguished lineage is proud of his descent surely it is legitimate for corporations to feel the glow of local patriotism animate them, and to spare a thought for buildings beautiful and impressive, for art collections pleasing and instructive. The very corporate existence of our cities and towns has only been achieved slowly, and at the cost of great endeavours by generations of public-spirited men, who have wrested from kings and governments and from manorial lords their charters and rights of market, and it is but fitting that these things should be duly commemorated.

The thoughts that gave rise to these words came unbidden in the Great Hall of Manchester's great group of public buildings—that stately pile of Waterhouse's which, if too closely beset with small enrichment to have that largeness of scale which public buildings demand, and too weirdly planned for the stranger to readily find his way about in, is still a noble home for Manchester's municipal life. In that hall is the series of pictures by Ford Madox-Brown setting forth some phases in the rise of Manchester, from the founding of Mancunium by the Romans until the beginning of the era of invention. This series is famous, and rightly so, for it was not only a work of the most individual of the Pre-Raphaelites and of all his works the most characteristic, but stands forth as the first attempt made to picture the history of a city for the benefit of its citizens. Moreover,

Ford Madox-Brown achieved something more than he suspected or the City Fathers bargained for. His style, a curious amalgam of old conventions and modern waywardness, does more to interest the public than the productions of any other conceivable painter or decorator. Sometimes, going the round of these frescoes, we think him to have lacked both drawing and a sense of humour, and again, in some exquisite bit of observation, he proves himself at once a consummate draughtsman and a humorist of the first degree. Bound by no rules, he produced a series of works that have no part with the lifeless formulæ of the average historical painter, and, although he may have disappointed some conventional folk, has earned our gratitude. It is too much to expect to discover another such artist immediately or to find many other opportunities for his gifts when discovered, but in this direction—that of fine buildings and art collections—lie the opportunities for distinction of our wealthy corporations. C. G. H.

Sites.

THE wisdom contained in the proverb of the two men who built their houses respectively on the sand and the rock is, of course, indisputable, but of the wisdom of the following remarks of a recent writer in a high-class American architectural paper not as much can be said:—"Happy is the architect who can set his house on an uneven site! Happier still is he who can plant it on a rocky one, and happiest of all the man who has irregular masses of stone to build on, cropping out amongst turf and soil. From such sites, indeed, the architectural tradesman will pray to be delivered; he can see no possibilities in them and only one certainty—the certainty of extra trouble to himself. . . . The only course he can advise is to have the place levelled before he begins. . . . Enough of the architectural tradesman—twin-brother to the jerry-builder, and spoiler of all the beauties of our land. The real architect, on the other hand, will feel that now at last he has a chance. How with skill and infinite care he will so shape the structure to the ups and downs of the place it stands on that it looks almost from the first like a part of nature. . . . Even a few grassy mounds, with the walls artistically fitted to them, will give a house the priceless individuality which no outlay on materials or decoration can ever confer. But the fitting must be of that highest type in which art conceals art." Here we have a zealous advocate for a modern house built in the manner of Edinburgh Castle; very pleasing in the abstract, but most absurd when analysed. Just fancy a "most desirable villa" with a base like the teeth of a saw or the top of a wave: it is hoped that this contour is not supposed to be continued inside, otherwise the floor boards would have to run over the "grassy mounds" in places, forming a natural sideboard here and a flower-pot stand there, while we should go up and down hill to get from the sofa to the cupboard! This of course is not intended; but to enable the bottom floor to be flat, if levelling were not adopted, the joists would have to be a good way up the walls, and all the space below them would be lost: in the ordinary course, when the bottom floor is raised basements are formed below. One feels a holy enthusiasm in agreeing with the statement that the fitting "of the highest type" would give to the houses a "priceless individuality"—priceless indeed, in the dead cat sense. No, let the gardener-architect lay out the grounds if you will, let him adapt the natural undulations, the projecting rocks and, most important, the surrounding trees; but he had better have a flat site (not meaning necessarily a horizontal one) to build his house on, otherwise he may find he has the architectural delirium tremens now so prevalent in the good old Fatherland. R.

On Reflection.

English Balconies.

BALCONIES are intended to serve a useful purpose, to support something or somebody. Yet most of these additions to houses in this country are never used. Therefore, why keep adding them? To the Spaniard or the Italian the balcony is of real use, because it is here that he likes to take his noonday siesta or to sit and smoke under cover of bright-coloured awnings. But the Englishman does nothing of the sort: he is not to be found on his balcony when the temperature rises to the nineties; neither is he to be seen there after the table has been cleared and he is at rest with all the world. No, at these times you will generally find him in the library chair, on the dining-room sofa, or leisurely taking stock of his geraniums, lobelias or kidney beans. So that it seems foolish to provide this useless balcony. Its presence would perhaps be justifiable if it enhanced the beauty of the building; but it does not—rather it disfigures it, because in many instances it consists not of a stone slab projecting two or three feet from the wall with an enclosing iron railing, but of a prison-like arrangement of bars reaching half way up the window, with a narrow gridiron at the bottom presumably intended for flower pots. Again, there might be some defence if the balconies were used for these flowers. It is true that many persons do make this use of them, but the greater proportion do not, with the result that when the paint on the iron has blistered well, showing rust below, and all the angles and tracery have become choked with dirt, the balcony is even more displeasing to look at. By all means erect balconies if they are going to be used; but what is the use of doing so all along the street frontages when it is known that it is not the custom of the country to sit out on balconies placed in these situations?

A New Terror.

AMERICANS will do anything. Such is their craving for novelty, such their fever for acquiring dollars, that precedent or established æsthetic opinions receive little consideration. Everything is rushed madly onward as if they thought the world were coming to an end soon, and only a short time remained in which to "mail" all things forward and book a front seat on the golden car of Life's Vanguard. A peculiar characteristic of the Yankee is that while he comes over here and affects an interest (which flavours strongly of the guide-book) in our romantic castles and abbeys, he returns to his country as keen as ever in his all-engrossing commercialism; so that here he is a mere sentimentalist, a being with the feelings of a poet and the backbone of a "storekeeper." His inborn "go-aheadness" is of course responsible for the fact that the States shares now in the glory of the great nations of the earth, and there are phases of it which are highly commendable; but, after all, it is just this feeling which has created such monstrosities as overhead railways and sky-scrapers. As, however, we take America's lead in many things (not omitting the weather), it is to be feared that there will shortly be added to our list of incongruities the building with the sheet metal front. Steel construction in building has now become an exact science, but hitherto the tall building, though virtually of steel, has been cloaked over with a stone front, tacked on to the framing as it were. The employment of metal has now been carried a step further. Houses with fronts faced entirely with sheet-metal plates are now becoming popular in America. This is only a development of corrugated-iron building, but, unsightly as the iron is, it is handsome in comparison with the highly ornamented metal front. A writer has said in these columns: "You may do what you will with corrugated iron, you may paint it red or green, or in stripes, or leave it for the dust to settle on and tone down its rawness a little, still it remains the emblem *par excellence* of naked and unashamed gimcracking." What, therefore, can be said of those metal fronts which have the worse features of being loaded with senseless and unsuitable ornament? Simply that they are an eyesore. And yet if "Jerry" gets the chance he will put them up here by the dozen. It is interesting to note that sheets can be obtained stamped to imitate brick and rock work, which would of course add to their merit. The sheet metal used for interiors was bad enough, but now that the idea has been applied to the façade the effect is doubly offensive. It is the fact that the fronts are so ornamented that makes one fear. The ornament is laid on wholesale, and we all know the notion is prevalent nowadays that restraint in design means plainness and that much florid ornamentation means beauty. So that the outlook is disquieting.

Two Good Statutes.

ON Friday evening last the Local Government Board issued a circular to county councils respecting certain Acts of Parliament passed during the recent session which contain provisions affecting them. Among these Acts are the Housing of the Working Classes Act, 1900 (63 and 64 Vict., c. 59) and the Ancient Monuments Protection Act, 1900 (63 and 64 Vict., c. 34), and the present is therefore a fit opportunity to point out exactly what new powers are now given to councils. Before the passing of the new Housing Act, Part III. of the Act of 1890 could only be adopted in a rural district after a somewhat complicated procedure, but now a rural district council may, with the consent of the county council, easily adopt Part III. of the Act of 1890 for the whole or any part of its district. Again, with the consent of the county council, the rural authority is now enabled to lease land to any lessee for the erection of lodging-houses. In its leases the following provisions are specially to be inserted:—(1) Binding the lessee to build on the land as prescribed, and to maintain and repair the buildings, (2) securing the use of the buildings exclusively as lodging-houses, and (3) prohibiting any addition to or alteration of the character of the buildings without consent. If the rural authority does not properly exercise its powers these may be transferred to the county council, a provision which needs only to be stated to be appreciated. This new Housing Act should prove very beneficial in alleviating the existing misery and overcrowding now so deplorable in rural districts. The other Act passed during last session—the Ancient Monuments Protection Act—has already been dealt with in these columns, but a summary of its chief provisions may here be given. Its object is to facilitate the preservation and maintenance of ancient monuments, this term embracing any structure, erection, or monument which is of historic or architectural interest. County councils are empowered to purchase or become guardians of any monument, and are also enabled to receive voluntary contributions towards the cost of purchase or maintenance. There is also a section imposing penalties for injuries to ancient monuments. Like the Housing Act, much may be expected of this one, and now that legislation is giving the necessary power we may feel less fearful about many historical structures throughout the Kingdom. There will now be no talk of carting them away, stone by stone, and re-erecting them on alien soil.

HEVER CASTLE, KENT.

By FRANCIS R. TAYLOR.

HEVER CASTLE was built by William de Hevre during the reign of Edward the Third, and the existing defensive portion of the structure is probably similar to that erected by him. Sir Geoffrey Boleyn, a well-to-do tradesman and Lord Mayor in 1459, bought the castle from Hevre's descendants. He commenced the present building and left its completion to his grandson, Sir Thomas Boleyn, father of the unfortunate Anne Boleyn. On the death of Sir Thomas the estate passed into the hands of Henry the Eighth, who gave it to Anne of Cleves. It is owned by the Waldo family, who have now held it for more than a century and a-half.

Hever Castle is a good example of fifteenth century domestic architecture. It may be considered as transitional between the feudal castle of a turbulent age and the peaceful nobleman's residence of a later period. The home in these mediæval times had to fulfil the double purpose of a habitation and a means of defence, and the arrangements for guarding against attack at Hever Castle appear to have been very

PORTCULLIS, HEVER CASTLE, FROM COURTYARD.

thorough. There is a wide deep moat surrounding the building, but owing to its having been neglected the water (from the river Eden) is now in a state of stagnation, though it is covered with beautiful water lilies. There was formerly an outer moat at some distance from the inner one, but this has long ago dried up and been filled in.

Hever Castle is rectangular on plan, with an open courtyard. The external appearance is very picturesque, with the high-pitched roofs and effective gable ends. The castellated gatehouse on the east front is approached across the moat by a bridge of brick and stone, the drawbridge having long since disappeared. The gateway contained three portcullises, the outer and the inner of which remain intact. They are formed of a stout framework of oak secured with iron riveting, and they slide up and down in stone grooves. The outer folding doors have a riveted framework of oak similar to the portcullises, whereas the inner folding doors are of solid oak with a wicket in them.

The rooms above the gateway were used as furnace chambers for melting lead and pitch. These materials could be poured through holes in the stone vault of the gateway to give an exceptionally warm reception to an attacking party. The gatehouse forms one side of the courtyard; on the other three sides the dwelling apartments are suitably arranged. The domestic work facing the courtyard produces a very good effect with its parapeted walls of timber and plaster and with its oak mullioned and transomed windows.

The internal arrangements as originally conceived and carried out have been much modified by the succeeding owners of the place, with the inevitable result that the existing order of things is far from satisfactory. The banqueting hall, for instance, must have lost most of its charm when converted into a kitchen. The old kitchens are on the north side of the building, and have two large arches over the fireplaces, one of which has been built up with brickwork. The passage between the old kitchens and the banqueting hall is shut off by an old oak screen with fluted pilasters.

There are several subsidiary staircases in addition to the principal one, and some are of recent date. Formerly a spiral staircase led from the banqueting hall to the upper floor, and provided access to the first-floor rooms and to the Long Gallery. This gallery, under the roof on the west side, is an extremely interesting part of the house. It has at the north and south ends a four-light transomed window, and a large bay window on the west side at the south end. The glass of the bay window has been taken out, and the spaces between the mullions filled in with brickwork, which seems rather a pity, considering the historical associations connected with it. From this window, it is said, Anne Boleyn watched the departure of her royal lover and his cavalcade. The oak panelling to the Long Gallery has Ionic pilasters spaced at intervals. The carving to the caps, the fluting of the pilasters and the mouldings to the panelled work are beautifully wrought. There is a fireplace recess at about the centre on one side of the room, and a trap-door at the north end opening into one of the secret dungeons of the castle.

Many of the apartments throughout the house still retain the old oak panelling in its original condition, though a portion of it is missing here and there. The panelling in the room over the gateway has been executed in recent times, and is of deal painted to resemble oak—a "sham" which is at once apparent and does not commend itself. A similar treatment of deal panelling is also found in the guard room.

The grounds of the Castle are now hemmed in by trees, but during the historic events enacted here there was a bowling green on the eastern side, situated on the space between the inner and outer moats. Facing the bowling green is a curious old wooden stable of fifteenth-century date. Above the stables are several interesting sleeping apartments, with a gallery in front looking on to the bowling green and the east front of the Castle.

The roads leading to Hever Castle are notorious in wet weather for their muddy condition, and Henry the Eighth, who frequently rode over to see Anne Boleyn, many a time

COURTYARD, HEVER CASTLE.

stuck in the mud. A blast of a horn was then sounded and the Castle retainers came to his assistance.

At Hever, Anne Boleyn spent her early years and was educated under the guidance of a French governess. She attended Princess Mary on her journey to France, and upon returning the courtship with the amorous monarch proceeded apace, a courtship which led to her marriage and, after a little more than four years of wedded life, to her execution (May 19th, 1536).

Her father, Sir Thomas, died two years after this event, and in the Boleyn Chapel of Hever Church is his monument, which consists of a large square tomb covered with a Purbeck marble slab. Upon the slab is a fine brass of his effigy with an inscription at the head giving the date of his death—March 12th, 1538.

It is stated that Anne of Cleves (Henry the Eighth's fourth wife) died at Hever Castle, but there is evidence to show that the Palace of Chelsea was the scene of her death. There is, however, no doubt that Anne of Cleves lived at Hever, and in her will, made two days before her death, she left £4 to the poor of the parish.

It may be interesting to note that opposite Hever Church is a roadside inn, the sign of which is "Henry the Eighth," and on the sign-board in front is depicted a front and back view of the bluff king's head. This inn was formerly called "The Bull and the Butcher," which title

HEVER CASTLE: SOUTH-WEST CORNER AND MOAT.

referred to the incidents connected with the unfortunate tragedy of Anne Boleyn.

The romantic old castle is well worth a visit: there is a picturesque attractiveness in its castellated portion and in its old domestic work, besides an absorbing interest in its historical reminiscences.

[The foregoing notes were written some time ago, since when the author believes that considerable reparation work has been carried out at Hever Castle.]

THE PRISMATIC LIGHTING OF DARK INTERIORS.*

BY DR. WILLIAM H. GREENE.

THE practical application of the refractive property of the lens or prism to change the direction of light rays passing through it, for the purpose of artificial illumination, originated with the French physicist Fresnel, who first suggested its use in lighthouses, for the protection of maritime coasts, about the year 1815; and the Fresnel lens in various modifications is to-day solely used for this purpose.

The Fresnel lens is designed for projecting a powerful beam of parallel light upon objects to be illuminated at a distance. The principle of this device is seen in Fig. 1, which shows a central plano-convex lens surrounded by a series of rings or segments of

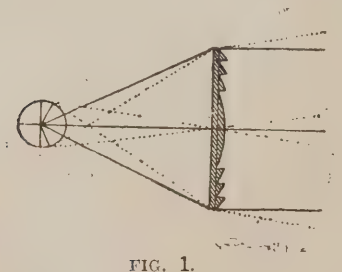

FIG. 1.

lenses or prisms, to which successively diminishing curvatures or angles are given in order to give them a common focus.

Within the past four or five years the application of this principle has been made, and with decided success, to the illumination of dark interior spaces, where the amount of light naturally entering is insufficient for satisfactory illumination, and artificial lighting must occasionally or constantly be resorted to.

The requirements of public buildings and modern office buildings in this respect have been most urgent, and the various devices known generally by the name of "prismatic lights" have been extensively used for the purpose, and have come to be regarded by architects and builders, not to speak of a great number of householders, as indispensable.

It is the purpose of this communication to give a brief review of the art of prismatic lighting, which at the present time is passing through the active stages of the course of evolution to which all the arts are subject, in determining the survival of the fittest.

Omitting for the present consideration of the vault light for basements and cellars, where but one form of prism, namely, an approximately right-angled prism depending on total reflection for its utility, is admissible, there are two general methods in vogue of installing prismatic lights to meet the requirements of service.

In one of these the sheet of prismatic glass is placed in a window-frame in the vertical position, thus taking the place of the window light. In the other, the sheet of prismatic glass is fixed in a more or less inclined position, projecting outwards from the window opening. This form of construction is known in the trade as a "canopy." The question as to which of these two forms of installation will give the best results is determined by the extent of the sky opening upon which dependence must be placed for light.

Where this is of considerable area, as, for example, where the windows face a wide street, the prismatic glass set into the window-frames in the vertical position will give satisfactory results. Where the windows receive their light from a restricted area, as, for example, in courtyards or the side-yards of dwelling-houses, and generally in the many situations where high walls rising in close proximity cut off the free access of light from above, the projecting canopy form of prismatic glass is preferable.

Speaking in a general way, the change from the vertical to the canopy form of installation will be indicated when the incident angle of the light falling on the window opening averages 60° from the horizontal plane.

The popularity achieved by the use of light-projecting devices of this general nature has called into existence a great number of patented inventions, some claiming special forms of prism construction (in combination, in certain cases, with a prismatic or lenticular formation on the reverse side of the glass), and of a far greater number of patents for and methods of glazing, and other matters of minor detail. For the purpose of this communication, these minor devices may be left out of consideration, and the several generic forms of prism construction only will be given attention.

These may be divided into two general classes:—(1) Those in which the glass forming the light-projecting device consists of sheets having on one surface a series of prisms or segments of lenses of any desired angle, the back of the sheet being a plane surface; and (2) those in which the glass forming the light-projecting device consists of sheets having on both surfaces a series of prisms or lenses.

The prism glass most generally known and used is that of the first-named class. The action of a section of prism glass of this construction is shown in Fig. 2, in elevation and plan. It is obvious that the general refracting effect of the prismatic surface in this and in the other forms of prism glass will be substantially the same, whether the refractive surfaces of the structure be straight (i.e., prismatic), or more or less curved (i.e., lenticular), irrespective of the angles of the prism sections or of the curvature of the lens segments. It is important, however, that these angles (or curves) be carefully considered, since upon the correct appreciation of this element the light-projecting efficiency of the structure largely depends. Improper angles (or curvatures) may greatly diminish the efficiency of the device, by the dispersion and loss of light, caused by total reflections in the interior of the glass.

There is general misapprehension regarding the proper action of light-projecting glass, which needs a word of reference. It is assumed by many that the prismatic light should be so constructed that all the exterior light transmitted from the interior boundary of the prismatic window, or canopy, should be directed in lines substantially parallel to the boundary walls, floor and ceiling of the apartment, and that the more nearly this condition is realised the closer will be the approach to the theoretically perfect mode of operation. Some of the manufacturers of prismatic glass endeavour to realise this condition by varying the angles of the prisms uniformly from the centre to the edges of the sheets, on the principle of the Fresnel lens.

A little consideration of what is intended to be realised by prism lighting of interiors will suffice to show that this view is an erroneous one and liable to result, in practice, in a much inferior interior illumination than can be otherwise obtained. This criticism will be understood by stating the general proposition, that the objects of prismatic lighting are, first, to direct as much extraneous light into the interior as possible, and, second, to direct it in such a manner as to derive the largest possible benefit from it.

In considering the relative merits of parallel and divergent light transmission by prismatic glass, it should be said that practically as much extraneous light can be directed into the interior space to be illuminated by the one as by the other arrangement of prisms or lenses. But, when we come to consider the second portion of the proposition, it can easily be shown that the system of transmitting the light in parallel lines cannot possibly be as effective as the method of divergent transmission, and more especially divergent transmission in both vertical and horizontal planes, and for the following reason:—

It is well known that the best effects in interior illumination are realised when uniform diffusion throughout the apartment is obtained. This effect can be secured most effectively only when all shadows are obliterated by calling into requisition the action of the entering light reflected from all parts of the side walls, floor and ceiling of the apartment.

By the method of directing the transmitted light in parallel lines, the ill effects of shadows cast by opaque objects in the path of the entering light will be realised in the most extreme degree, as there will be no ameliorating influence to counteract and neutralise the shadows by reflection from the bounding walls and floor of the apartment; and an inspection of the condition of an apartment thus treated will disclose this objection at once.

By the method of divergent transmission, while quite as much or more extraneous light is thrown into the apartment as by the other method, its distribution is decidedly more advantageous, from the fact that the repeated reflections from the bounding surfaces of the

* Paper read before the Franklin Institute at the meeting held in June last.

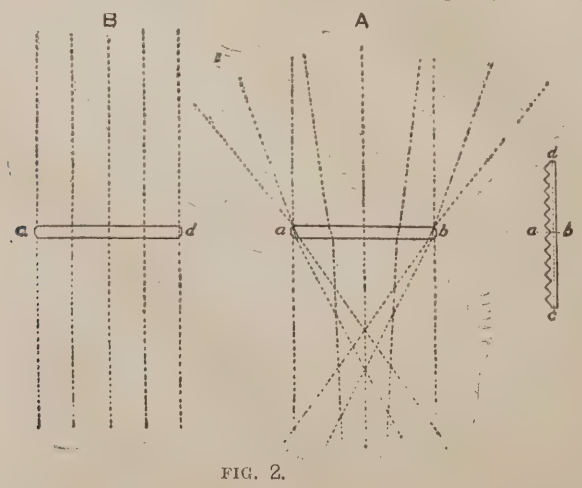

FIG. 2.

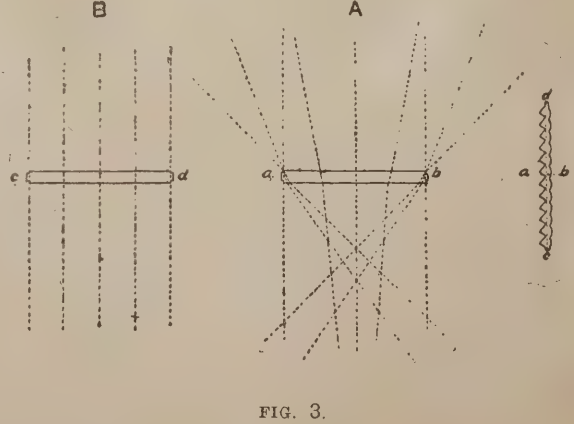

FIG. 3.

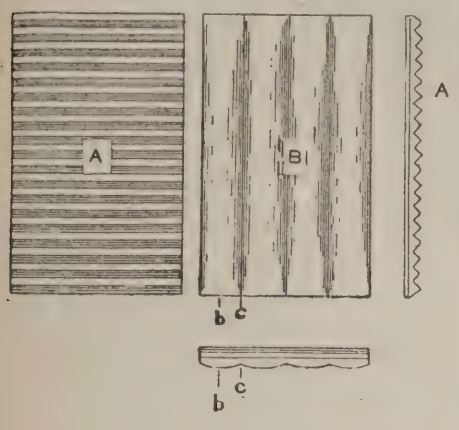

FIG. 4.

apartment cause the practical obliteration of all shadows and a practically uniform diffusion of the light to all parts of the interior.

Returning now to the descriptive portion of the subject, the *modus operandi* of the simplest form of a light-projecting prismatic window is shown in the plan views in Fig. 2, A and B, in which the light from an exterior source falling upon the plane outward surface of the glass is refracted at the boundary of the interior prismatic surfaces and projected into the room to be illuminated.

Fig. 2, A, which is a plan view of this construction taken on the line *a b*, exhibits the effect of the light distribution in vertical plane from the effect of refraction from the terminal portions of the prism, where the influence of the more oblique rays is not counteracted by a modification of the angles of the prism from the centre line to the upper and lower edges of the glass. Fig. 2, B, is a plan on line *c d*, showing that the light rays are not distributed divergently in the horizontal plane, but are all directed in parallel lines.

Figs. 3 and 4 represent the action of prismatic glass of the second class—those having both surfaces prismatic or lenticular.

Fig. 3 shows a form of light-projecting glass that has lately come into use, and for which certain advantages are claimed over the construction previously described. The sheets in this form of prism glass have one surface furnished with prisms—commonly placed towards the room to be lighted—and the other surface formed of a series of lenses of small curvature, distributed in panel form, parallel to the direction of the prisms. This construction, as well as that shown in Fig. 2, manifestly exaggerates in the vertical plane the divergent distribution of the transmitted light, and consequently operates, so far as it goes, in the correct manner, utilising the reflecting action of ceiling and floor in diffusing the light.

The construction shown in Fig. 3 possesses one obvious advantage over the several modifications of Class 1, namely, that the lenticular form of exterior surface arrests and directs into the dark interior to be lighted a certain amount of the exterior light, which, with the plane exterior surface of Class 1, would be lost by total reflection from the exterior plane surface. Practically all of this additional light thus projected into the dark interior would be gained if the angle of the prism and the curvature of the lens panels were correctly adapted to the length of the apartment to belighted.

The latest modification of Class 2 remains yet to be considered. In this, the interior prismatic surface of the glass is the same as that just described, but the exterior lenticular panels are arranged not parallel, but transversely, to the direction of the prisms. The details of this form of construction are shown in Fig. 4, A and B, while the *modus operandi* is best observed in Fig. 5.

The radical difference in the operation of this form of light-projecting glass and that of both forms previously described resides in the fact that the light distribution in this form is exaggerated in the lateral as well as in the vertical plane. This feature is illustrated in Fig. 5, B, which is supposed to be a section of the prismatic glass taken on the line *c d*, from an inspection of which it will be manifest that the vertical arrangement of the exterior lenticular panels will serve a similar purpose in this construction in relation to the light falling sidewise on the exterior surface of the glass as the lenticular panels in the previous case serve in relation to vertical rays: namely, to arrest and refract into the dark interior a considerable amount of light in the horizontal plane which would otherwise be lost for useful purposes. All of the light thus collected and introduced into the dark interior by the lateral collecting action of this device is so much clear gain over the devices previously described.

Further consideration will show, also, that if the interior surface of the glass be provided with prisms of uniform angle, determined in each case by the length of the apartment to be illuminated, this form of construction will secure the same advantage in respect of the vertical diffusion of the entering light as will be obtained from the lenticular prismatic construction previously described.

On theoretical grounds, therefore, the last-described modification of light-projecting glass, belonging to Class 2, should give the best results if intelligently installed. Comparative practical tests also bear out this conclusion.

An additional and important advantage possessed by prism glass of the last-named construction (namely, a prism plate constructed

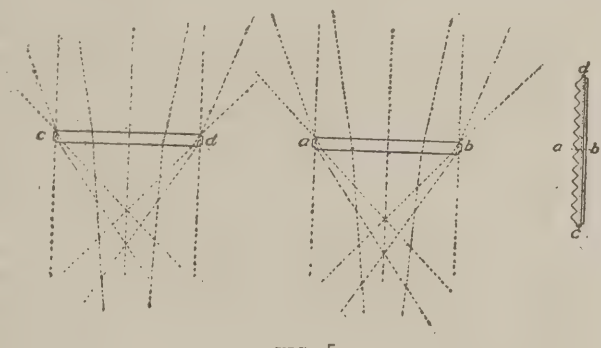

FIG. 5.

with prisms on one side and prisms or lens panels arranged transversely on the reverse side) remains to be noticed.

Since all illumination by means of prism glass is thrown from a comparatively low point, namely, through windows, while all other artificial illumination is directed from a point above, the shadows produced by the prisms on objects in a room constitute a disadvantage common to most systems of lighting by means of prisms, as has been noticed in what has preceded. The light-projecting glass last described, however, by reason of its diffusing quality, both in the horizontal and vertical planes, largely overcomes this objection. Where two such prism windows are used for the same apartment the light thrown from one window completely overlaps that thrown from the other, thereby practically obliterating the shadows produced by prism lights of other constructions.

This construction also has the advantage of enabling manufacturers to produce more readily the larger sizes of prisms, from the fact that one surface has projections at right angles to projections on the reverse side, giving a bridge effect, thus adding to the strength of the plate. For this reason, likewise, it is not essential to have the thickness of the body of the glass as great as with other forms, and, inasmuch as there is a larger loss of light through absorption in passing through a thick than a thin medium, the loss of light from this cause may be very much reduced.

Finally, it may be said that all the various forms of light-projecting prismatic glass accomplish measurably their intended purpose of considerably increasing the illumination of dark interiors over what would occur without artificial aid. In the selection of the kind of light-projecting glass and the manner of its installation the user should be guided by the personal observation of the effects produced rather than by the claims of rival manufacturers.

Current Periodicals.

The Pottery Gazette for September contains much information on the use of lead in glazing, including a letter showing in what respect leadless glazes fall short.

The Genealogical Magazine this month includes articles on "The Armorial Bearings of the Colony of the Cape of Good Hope," "Concerning Heirs and Heirships: Some Instruction for Novelists," "The Stafford Attainders" and "The Armorial Bearings of a Lady." The line drawings of the various armorial bearings are very suitably treated, the result being an excellent reproduction.

The Antiquary.—The article in the September issue of this journal which will be of most interest to our readers is one on the frescoes discovered last year in Little Kimble Church, Bucks. This little church appears to have been completely covered internally with wall-paintings, which were subsequently defaced by Biblical quotations and whitewash in the seventeenth century, or utterly "restored" out of all semblance to their former selves in the nineteenth. Writing about lych-gates, a correspondent suggests that these were originally transported church porches.

The Journal of the Society of Architects for August announces that an examination for membership will be held at the Society's rooms, St. James's Hall, Piccadilly (and also in some provincial centres, if found desirable), on October 9th, 10th, and 11th next, commencing each day at 10 a.m. and terminating at 5 p.m., with an interval of one hour between 1 and 2. The latest date for entering for the examination is September 11th.

The Quarry.—In the issue for September is an article on "The Quarry Stones employed at S. Maurice d'Agaune" from the Roman period to the present day, by Jules Michel. By a turn of fortune the Rhone Valley, which in the time of the Romans went for its building stones to the shores of Lake Neuchâtel, now sends thither columns, fountain bases and large blocks of polished marble. The La Raisse quarries (which the Romans worked to a considerable extent) have long since been abandoned, but the writer suggests that there is a chance now, with our modern appliances, to reopen them, and so enable the magnificent white stone to be used once more. This number also contains an article on "Modern Contracting Methods," showing the lessons for quarrymen to be learnt from the methods adopted on the Chicago Canal and the New York subway.

The Pall Mall Magazine for September includes articles on Inverary and the Wallace Collection at Hertford House. Inverary Castle is now a tourist spot, and during the summer months the *Lord of the Isles* daily brings up its horde of sightseers, turns them loose for half-an-hour, and then carries them off. The building is quadrangular on plan, with a circular turret running up at each corner, and the principal rooms are grouped round a central hall open to the roof and lighted by a pavilion. Many of the walls are covered inside with claymores, axes, and other fighting implements. Not far from Inverary is Dundarawe Castle, an interesting relic of the past; but after all it is the surroundings of Inverary and not its buildings that make the place so pleasing—the woods, the hills and the water are all delightful. The story of the Wallace Collection is told admirably by the late M. Charles Yriarte, who was the expert by whose opinion Sir Richard Wallace was guided in many of his purchases.

R.I.B.A. Journal.—The issue dated August 25th contains an article on the development of Manchester during the nineteenth century

by Mr. Frank P. Oakley, A.R.I.B.A. The plans of the city in 1800 and 1900 show in a striking manner the great changes that have been effected, the widening of the streets, the removal of insanitary areas and the sweeping away of wretched courts and alleys. The earliest authentic date in the history of Manchester is the year 79 A.D., when Julius Agricola established a Roman station at the junction of the rivers Medlock and Irwell. Illustrations are shown of the Free Reference Library, Manchester Exchange in 1820, the Town Hall (Alfred Waterhouse, R.A., architect), St. Mary's Church, Crumpsall (designed by the late Mr. J. S. Crowther), and of several streets. Mr. E. W. Hudson, A.R.I.B.A., contributes an article on the Church of St. John of Jerusalem at Clerkenwell and the discoveries that have been made there recently.

Scientific American (Building Edition).—The August number of this publication contains the usual collection of perspectives and plans of American residences, but the wearying similarity of these designs precludes their being noticed. They are not beautiful, and they look as if they were turned out of some colossal architectural factory to suit any requirement of "cost, size or shape." On the front page there is a good reproduction of the Belgian pavilion at the Paris Exhibition. "Anachronisms in Art" is the title of an interesting article given.

Carpentry and Building (New York) for September contains working drawings for several houses, and articles on "Furnaces for Expensive Houses," "Making Perspective Drawings in Confined Space," "The Art of Wood Turning" and "Modern Factory Construction." The practical information and constructional details given in this journal are excellent, but it is a pity that the designs should be so conventional, and, in most cases, so lacking in beauty. On this side of the Atlantic we are aware of the influx into the towns and cities of the country labourers, but perhaps it is not so generally known that America is in the same plight. Our contemporary says that "the fierce competition of life in the big cities is becoming ever keener, and the ranks of urban labour, skilled and unskilled, are being swollen far beyond the limit of usefulness."

Architect and Builder (New York).—This is practically a new architectural paper, as the old publication has been revised and improved under the new proprietorship. In a thoughtful article on the design of the casing for steel structures, Mr. C. H. Blackall says that, however much variance of opinion there might be as to the inventive qualities manifested, "it is surely acknowledged that there is a right and a wrong way to design a tall office-building." This has resulted in the post-and-girder and the aqueduct styles being superseded by the columnar form of design—that is, treating the whole front as one column, giving a strongly-marked base, a plain shaft, and a rich capital. The sky-scraper is indeed the outcome, not of desire, but of necessity, but its very proportions and monotony are against its being beautiful. "Domestic Architecture in Belgium," "Relation of the Engineer to Architecture" and "Imitation in Architecture" are the titles of three other articles in this number. There are ten separate plates printed on thick paper. Nine of them illustrate façades and interiors of private and public American buildings, the bulk of the work being, of course, in the Classic style so popular in the country. Looking at the porticoes of some American designs you might fancy you were going into a scientific institution instead of a private house.

Architecture (New York) for August is not a very good number. In noticing it we are obliged to refer again to the atrocious modern German school, because four designs are reproduced of a house façade, staircase, hall and garden front from the "Die Kunst." We criticised these very designs in a former issue, and we are glad to see that our American contemporary has the same opinion as ourselves about them. Of the façade is said: "This nightmare is published to show to what an extreme the unrestrained use of applied ornament can be carried," while the garden-front design is sarcastically described as "a restrained example of the Secession style." No one could deny that modern Germany has an architecture (!) of its own creation; but, ye gods, don't let us have it over here. Friend William should teach his countrymen to design better, even if only "for the honour of the Fatherland." In this number there are two excellently-printed plates of a country house at Fort Hamilton (Little and O'Connor, architects), but the building is so Spanish in appearance that without reading the title you might suppose it to be in the neighbourhood of Seville; such copyism is not commendable. There is an interesting little article on the garden scheme carried out by Mr. N. F. Barrett at New Rochelle, N.Y. This gentleman's plot of ground is only 100ft. by 175ft., yet he has so arranged it that specimens of all kinds of gardens — Italian garden, Japanese garden, &c.—are to be seen.

The American Architect.—In the issue of this paper for August 4th there is an interesting note on the peevish self-complacency shown by some of the artists whose pictures are exhibited at the Paris Exhibition. Appended to the list of recipients of medals was a remark to the effect that the absence of certain names, which one might naturally suppose would be included in this grade or that, was due to the fact that these artists had informed the jury that "they would not accept silver or bronze medals"; and added to this there is the statement that this lordly condition was made *after* the list of gold medallists had been posted! In this issue there are six plates of competitive designs for a new Lady Chapel to St. Patrick's Cathedral, New York, by Messrs. N. Le Brun and Sons and Mr. George B. Post, both of New York. Messrs. Brun's design is the more pleasing of the two and harmonises well with the rest of the building; the roof, however, might have been made higher with advantage. In order to minimise labour and facilitate examination, the assessor furnished the competitors with identical outline drawings of the present cathedral, the east end being left blank for the addition of the new chapel; this device proved to be most advantageous. There is also in this number a delightful reproduction of the entrance to the old castle at Miltenberg-on-the-Main, Germany. "Notes on some European Systems of Forest Administration" is the title of a continued article in the issue for August 11th; the information given is of the dry-as-dust kind, and whoever it may be useful to it certainly is not of much good to the architect. The plates in this number include one of the Building Trades' Homes and five showing perspective, plans and details of a new chapel for the Troy Orphan Asylum (Warren, Smith and Biscoe, architects). The store and apartment house at Aue, Saxony, is less German than usual—and therefore less offensive. In the number for August 18th, however, the German shows himself in a villa by Herren Spittler and Kronfuss; only one word can describe it—hideous. Several other Lady Chapel designs (as above) are given as plates. The chief article is one by a writer who tries to show that the horizontal lines of the Parthenon were made to harmonise with the curve of the sea horizon. Such calculations have been pleasing to the hearts of Dr. Emil Braun and Mr. Penrose, but they do not convince, because there must necessarily be so much speculation; nobody knows exactly what the Parthenon was like.

The Clayworker (Indianopolis) for August is a most valuable and useful number. A writer shows how we have copied Nature in many of our inventions—the shells of turtles, the scales of fishes and the cones of trees are creations which the tiler has copied in laying his tiles. Hugh Miller says: "There is scarcely an architectural ornament of the Gothic or Grecian styles which may not be found existing as fossils in the rocks. . . . There is no form of volute known to the architect which may not be found in the rocks, but there are many forms in the rocks unknown to the architect." Much information about brickmaking is given in this number. There is also an article on the vitrified pavement so popular in Philadelphia. It consists of a 4in. concrete base, with a 1in. layer of sand above, on which are laid the bricks, 4in. deep.

The Canadian Architect and Builder.—A writer in the August number of this paper deals with sheet metal as sheathing. He says: "There is a peculiarity of all stock designs for metallic walls and sheathing which seems to be not only not necessary but injurious, producing a monotonous effect; this is the system of interlocking joints concealed by making them part of the pattern. It would probably be an improvement if the joints were recognisable as joints," and he very properly advocates that no pains should be taken to conceal the joints. He deprecates the stamping of sheet metal to imitate brick and rock surfaces, and concludes with the following very commendable remarks: "If the manufacturers of sheet-steel sheathing would divert ingenuity and expense from the endeavour to imitate constructive materials to experiment in search of a good plain or metallic lacquer they would, it seems likely, be doing the best thing to push their material to the full extent of its proper limit in architecture." The illustrations include some of Manning Chambers, Toronto (E. J. Lennox, architect), a large and somewhat pleasing commercial building.

The Building, Engineering, and Mining Journal (Sydney, Australia).—There is an amusing account of red-tapism mentioned in the issue of this paper for June 23rd. It appears that there was an ancient telegraph pole at Cobden, Vic., that had been troubling the minds of the powers that be. A "department" man was sent to inspect it. He did so, and delivered a report to the effect that the pole required a coat of paint. Another "department" man then set out for the pole with a can of paint! Australia is getting on. On page 56 of the BUILDERS' JOURNAL for February 28th last some particulars were given of the competition for a bridge across Sydney Harbour. In the issue for July 7th of the paper under notice is a letter from Professor Waddell, a well-known bridge engineer, about this competition. "Heads I win and tails you lose" is his description of the conditions imposed, which give no assurance that the successful competitor will have the carrying out of the work.

Berliner Architekturwelt.—There is an interesting article in the current issue of this journal on the new Mixed School on the Wilmsstrasse, Berlin. The architect is Ludwig Hoffmann, and the building—a free Classic treatment—is pleasing, though the curved dormers in the roof seem incongruous. There is a good deal of carving at the top of the porches, into which are introduced small heads of teachers and figures of schoolboys. The design for a bridge with three large spans, by A. Orth, of Berlin, has, over the centre piers, columns with sculpture on top, giving it an elegant appearance. Several designs for small country houses and a coloured plate of the police buildings at Augsburg are included among the illustrations. There is also an article dealing with the exhibit of the Berlin Royal Porcelain Manufactory at the Paris Exhibition.

Die Kunst for September is mainly taken up with the annual picture exhibition at the Munich "Glaspalast," but the pictures illustrated are of little direct interest to architects. The most interesting article from our point of view is that dealing with the Finnland Pavilion at the Paris Exhibition, which shows much quaintness of treatment. The several illustrations of the whole building and its details are excellent. Numerous illustrations are given in this number of "Art Nouveau" furniture. There is also an interesting article on "Modern Architectural Effort at the First German Building Exhibition at Dresden."

The Liverpool Architectural Society has just forwarded us the annual report and proceedings for the session 1899-1900. The number of members of this society is now 134 as compared with 131 last year. The balance in favour of the society is £164 2s. 8½d. The pamphlet contains the inaugural and closing addresses by the president for last year, Mr. E. A. Ould.

SOME NOTES ON DRY ROT.—II.

By A SPECIALIST.

(*Continued from p.* 49, No. cclxxxix.).

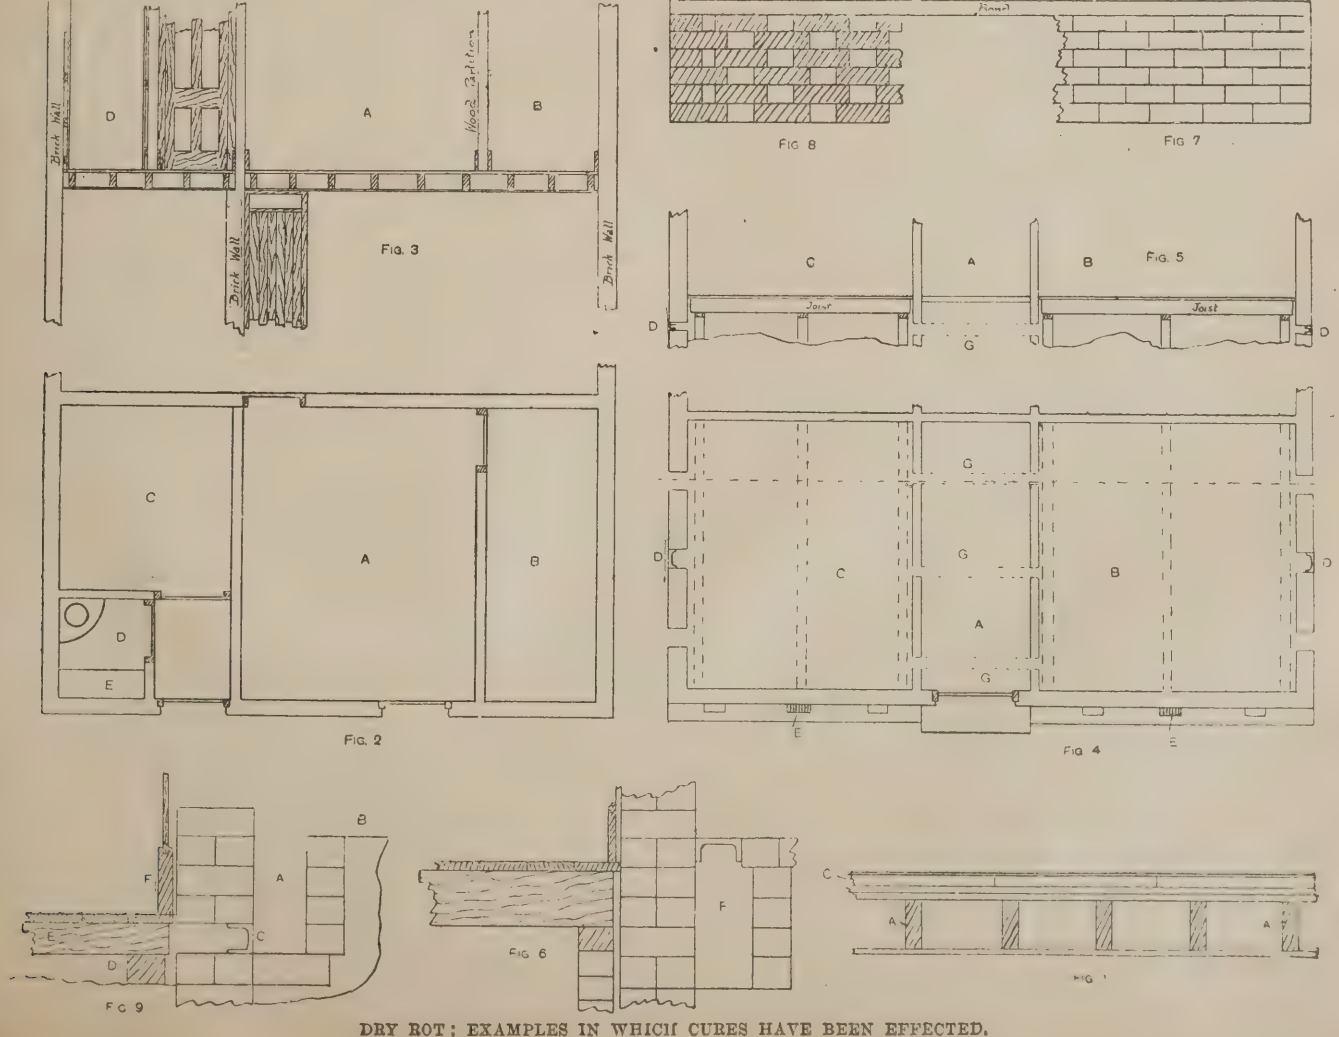
IN this article actual examples are given of bad cases of dry rot which have been cured. Fig. 1. shows a section of a floor commonly used in some parts of the country (especially in Lancashire) for kitchens and sculleries. It consists of the joists, A, plastered underneath and rough-boarded on top, the boards being covered with a layer of earth, on which are laid the flags which form the floor proper, C, these latter being often covered with linoleum.

It was a floor like this which I was called upon to repair. A portion of the plaster had fallen off owing to the joist being rotten, and I was ordered to take down sufficient plaster to put in a short joist, nailing it to the old one. On removing more plaster I saw that the boards above were rotten: the linoleum had to be taken up and a row of flags removed so as to enable the boarding to be repaired. But, on lifting the first flag several others, as well as the boards, joists and an assistant, went through into the cellar below. This decided the matter. The whole floor was removed, every door post was cut off and spliced, the skirting was replaced with new, the cavities in which the ends of the joists rested were thoroughly cleaned out, and the brickwork was well brushed with a hard brush to remove all traces of the fungus as far as possible. The walls were then given two coats of a solution of corrosive sublimate and the new joists and floor boards treated similarly. The flags were relaid, being first well swept and painted with the above solution and then bedded on fresh earth. The plastered ceiling was omitted, so as to give ventilation, the want of this being undoubtedly the cause of all the trouble.

On examining the cellar doors and windows under the above floor we found that the fungus had attacked them, travelling down at the back, where it could not be seen. These were accordingly taken out and replaced with new, giving two coats of solution to the timber and walls. The cure effected has been permanent.

The next example will show the advantage of doing work thoroughly when dry rot is concerned. The ground plan of the part affected is shown in Fig. 2 and a section of it in Fig. 3. Originally starting in the kitchen, A, the fungus had grown entirely through the walls to the rooms B and C, affecting every door shown; the room D was used as a lavatory and was matchboarded round, also the ceiling. All this was affected, as well as the joists and the floor above; the seat, E, was almost eaten away and the floor was dangerous to walk across.

The room D was not pointed out to me at first, but I discovered it in tracing the extent of the fungus, and on informing the owner that a clean sweep would have to be made of it, he laughed and said: "Certainly not, you shall not touch it; it was all reboarded less than twelve months ago"; and this I found to be true. The old boards had been removed and the walls creosoted and reboarded. The result was that I could push my fingers through the boards in a dozen places.



My remedy was a drastic one. Everything was cut away until all traces of fungus had disappeared. All walls, as well as the old and new timber, received two coats of the corrosive sublimate solution: no trace of dry rot has since appeared. The cause of the mischief in this case was traced to a leaky pipe, the water from which had found its way under the floor, which, being entirely unventilated, speedily developed dry rot, with the results given above. I may state that ventilation was ensured by leaving the cellar ceiling unplastered, as in the first case described.

The next example is a somewhat different one. The ground plan is shown in Fig. 4 and the sectional elevation in Fig. 5. A is the entrance lobby, with tiled floor, and B and C are respectively the kitchen and parlour, with boarded floors. As there are no cellars under, the joists are supported on sleeper walls, running from front to back, as shown by dotted lines. No provision had been made for ventilation except the air-bricks D at each end and the two marked E in front. These latter were inserted horizontally as shown in Fig. 6, as the ground line was too high to insert them otherwise; but as the builder had failed to make any connection between the open trench, F, and the cavity beneath the floor, they were not of much use. An extra sleeper wall was also carried up, parallel with the front of house, but what this was for is known only to the man who built it.

Two extra air-bricks were inserted at each end of the house, as shown, also two more in front at each side of the door, and openings were made in the house wall opposite each horizontal air-brick; openings were also made in the sleeper walls, so that the air could circulate freely, but no solution of any kind was used, the fungus not having obtained any hold in the walls. I recommended the insertion of three tubes as shown by dotted lines at G, but this was not done, although it would have been a great safeguard; the fungus, however, has not reappeared so far.

Many builders offer a direct incentive to dry rot by the method they adopt in building sleeper walls. When built as a solid 4½in. wall (see Fig. 7) the air is simply obstructed in circulation, where otherwise all might be well; whereas, if the walls are built as shown in Fig. 8, less bricks and less labour are required and the air is allowed free circulation throughout.

The concluding example is one in which I was unsuccessful, though not from any fault of my own. The floor was about a foot below the ground line, the joists touching the earth in some places, and the bond lying direct on the earth, in places almost buried in it. The only provision made for ventilation was the insertion of two air-bricks in the outside wall, at the bottom of two trenches built up for the purpose. The whole arrangement is shown in Fig. 9.: A is the trench; B, the ground line; C, air-brick; D, bond E, joist; and F, the

DRY ROT: EXAMPLES IN WHICH CURES HAVE BEEN EFFECTED.

panelled dado. The natural result of this arrangement was, of course, that the trenches caught a certain amount of surface water, which drained under the floor through the air-bricks, the timber suffering in consequence.

It was here that pitch-pine joists were put in as being "proof against dry rot," according to a so-called scientific builder; but when I took them out three months afterwards they had a fine coating of fungus. My recommendation in this case was to raise the floor and lower the ground, but I was overruled, and the new floor and dado were put back as before; and the last state of that floor is fast becoming as bad as the first. The next article will deal with the best methods of securing immunity from dry rot in various situations, prevention being decidedly better than cure.

(*To be concluded.*)

A.A. SUMMER VISITS.

COLNEY CONVENT, NEAR ST. ALBANS.

ON Saturday last the Architectural Association visited, as their sixth and last outing of the session, the very extensive buildings of the new convent at Colney, near St. Albans, now being erected for the celebrated Sisterhood of All Saints, Margaret Street, from designs by Mr. Leonard Stokes, at whose kind invitation the visit took place.

The site of this large range of buildings—which have, even in their unfinished state, a curiously mediæval appearance—is situated in the midst of a very charming old-world park of about fifty acres, one that possesses fine masses of old trees, large lawns, beautiful park land and an old kitchen garden of great size enclosed in the usual early eighteenth century red-brick walls of beautiful colour, covered in places by a luxuriant growth of creepers and wall plants; altogether the place forms an ideal setting for a conventual house that is to be the great centre of this famous order.

It is not the purpose of these notes to touch upon the history of this particular convent, that has led to the erection of the fine specimen of modern design and workmanship in question, one that may fitly hold its own with many ancient edifices of a similar character. The opportunity of its erection as an entire artistic and picturesque whole—the combination of traditional planning and design with modern design, producing an almost new type—has been very thoroughly taken up by the designer, whose building merits the closest attention.

Primarily, its plan consists of two large divisions, the convent itself forming the principal one and the entire service block the subsidiary division. The former forms an almost complete square of about 150ft. on each side, with a large refectory at the southern angle projecting beyond the general face of the building and connecting the large service wing (at its southern elevation) with the rest of the buildings. On the north side the conventual church will be erected; till then the large and elaborate Gothic refectory will supply the place of a chapel.

The general planning and disposition of the ground and first floors, and the arrangement of the apartments in the roof, not yet carried out, form one of the most interesting features of the design. The convent division is shaped as a large hollow square, around the inside of which is a grand cloister, lighted by very broad mullioned and richly traceried windows of a comparatively low height, and built into the face of the main wall. Above them are the windows of the cells. On each elevation of the quadrangle are moulded mullioned windows placed symmetrically between three bay windows that are carried up and run into the roof, or nearly so; and above them are some excellent dormer windows. All the roofs are covered with stone slates of much variety of colour, though chiefly browns and greys. The stonework throughout is particularly noticeable. It is of coarse texture, and one known as Welldon stone, freely worked, and producing a most artistic result, much like the effect of a well-weathered surface. This, in conjunction with the soft red brickwork, forms, even in its perfectly new state, a most pleasing colour scheme.

The cloister is roofed internally with a segmental concrete ceiling, with piers and ribs springing between each window parallel with the external buttresses. The whole is plastered, with the stone left in its natural colour. From the cloister are reached the principal entrance (with a parlour or waiting room on each side of the vestibule), the novices' day rooms, the guests' house, the choir sisters' day-rooms, the lay sisters' department, with many other subdivisions, connected with the large service block. This last comprises the kitchens, larders, pantries, stores and other rooms, stables, boiler house with a well-designed chimney of large size, electric light department, &c. Returning to the cloister, three staircases for each division of the tenants lead from it to the first floor, where, on the sides of a continuous central corridor, in itself a most interesting piece of design, are placed cells for a hundred sisters. By this means the space above the cloister walk is utilised to the fullest extent. These sleeping apartments are each about 11ft. 6in. by 8ft., with a window and door. The divisions, reaching from floor to ceiling as a complete partition, instead of the usual arrangement of a cubicle, are constructed of 3in. concrete finished in plaster and cement, and the flooring is made of about 2½in. of coke-breeze concrete brought to a true face, upon which it is proposed to lay ordinary grooved and tongued floor boarding in narrow widths.

The lavatories, &c., are cleverly formed on the usual sanitary principles and arranged within turrets as portions of the architectural design. They are carried out with red glazed brick dados and plastered walls. The wiring for the electric lighting is carried through iron tubes.

The composition of the external elevations generally is extremely effective and in the style of Gothic that the architect has made peculiarly his own. The principal entrance front consists of a massive central feature reminiscent of a large gate-house flanked by turrets. This feature appears also in the cloister court, but has not reached much above the roofs. On either side stretch long ranges of moulded and mullioned windows, those to the south terminating in the elaborate refectory, a very large hall with comparatively small traceried windows set in deep moulded reveals between massive buttresses, a large bay window and a lofty turret. The window in the end wall is a richly traceried one of seven lights. The apartment, which has a hammer-beam roof, is more or less a reproduction of a fine mediæval type. At the northern end of this façade in due course will come the east end of the church, forming a complete scheme. The remainder of the elevations are treated in a very similar manner, built of stone and banded red and stock bricks.

H. D. W.

Correspondence.

"Builders' Journal" Insurance Policy.

To the Editor of THE BUILDERS' JOURNAL.

PARKSTONE, DORSET.

SIR,—In order to be eligible for this policy, is it necessary that the traveller should actually have the BUILDERS' JOURNAL upon his person at the time of the accident, or would having the paper in his possession mean that it might be left at his house? If not, could you not alter the rule to that effect? I believe "Tit-Bits" and other papers allow this to be done. I am a constant subscriber to your paper, but it is inconvenient to carry it about.

Yours truly,

CLERK OF WORKS.

[The Credit Assurance and Guarantee Corporation, Limited, state that they are quite prepared to give the wider meaning to the words "that at the time of the accident the passenger in question had this paper in his or her possession." This means that they would not debate a claim where the publication was not actually on the passenger, but in his possession at home.—ED.]

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

SOUTHPORT.

SIR,—Notwithstanding the protest of "Vigilans," I am inclined to think that "Ambitious" is right in saying that "it is probably their own fault that so many men have salaries of 20s. and 25s. a week." Of course there are exceptions to every rule, as "Ambitious" recognises by the use of the word *probably*, but generally speaking I think architects' assistants get paid what they are worth.

That a youth who has worked for five years for nothing, and whose parents have not only paid a premium to article him to some architect, but are also considerably out of pocket for his keep during those five years, should receive so poor a salary as 25s. seems altogether wrong somewhere. Somewhere! Yes, but where?

The question resolves itself into the old one of Architectural Education in this country. Parents and guardians know nothing of what they are doing when they article their boys to this or that architect. In most cases the premium is paid and the parents think no more about the matter till the boy is "out of his time." Then they complain of the salary that Jack will probably be offered. But the chances are that Jack is not worth more than this pittance. He may be an estimable fellow, but he may be no good as an architect, and the sooner he finds it out the better. If he can be sure of 30s. to start with he will probably be a long time in finding it out, which will be a pity for him; for if he is to make a change the sooner it is done the better.

It is a pitiable spectacle to see the numbers of boys put into architects' offices who by no chance under the sun can ever hope to be architects, or even successful assistants. The main fault is with the parents. The boy does not find out his inaptitude for the profession till a year or two of his time has passed. He is fast for five years, so he tries his best. But it requires quite special faculties to become an architect or an architect's assistant, and no hard work will give you those faculties if they are not yours to begin with.

The 20s. salary offered will be a quiet reminder that you are in your wrong place. If you are ambitious you will look round for a better field for your energy. It will be an unpleasant awakening, perhaps, but best let it come early.

My own experience has been of this nature. When out of my articles I received 25s. a week. But I was not worth more to my employer. It was the old tale of going into the profession ignorantly and without the special faculties necessary. One must be an all-round man, and an academic liking for the study of architecture does not make an architect. Neither, on the other hand, does one or other of any particular branch of the architect's work.

There are lots of manufacturing firms who would be glad of the experience of young men trained in architects' offices. I mean firms connected with the building trade. My experience of the inside of an architect's office makes it easier, perhaps, for me to approach architects as the representative of one such firm. There may be a loss of "caste" to some "professional men" in thus giving up architecture for business, but that is a thing that will harm no one who has the right stuff in him.

I see a good deal of architects now, and from what I can learn really good assistants are not easy to find. At any rate, they will get paid what they are worth. That they might be worth far more at some other work is no cause for them to grumble against their employers, but rather a reason for getting into this other work.

I think the proposal of combination to insure a minimum salary of 30s. would be a huge mistake in the interests of the individual assistants, as it would prevent a lot of young men from ever getting more than this, who under the present conditions would turn their hands to other more profitable work. It would keep inside the profession a large number of men who from all points of view are better outside.—Yours truly,

F. H. C.

FORMATION OF NEW STREETS.

THE LAW IN SCOTLAND.

AT the recent meeting at Elgin of the Association of Burgh Officials of Scotland, Mr. F. G. Holmes, C.E., burgh surveyor of Govan, read a paper on "Laying-out New Streets." In dealing with the Burgh Police (Scotland) Act, 1892, he held that section 146 should be amended so as to deal in a satisfactory manner with the lines of new streets. In his experience, proprietors of feuing subjects had feuing plans prepared showing contemplated lines of streets through their properties without any regard to the practicability of extending them through adjoining properties. He held that Commissioners should have the power to regulate the lines as well as the levels of proposed streets. The widths of proposed streets were even of more importance than the lines of them, and on this matter the power of the Commissioners was very limited, as would be seen by referring to section 152 of the Burgh Police (Scotland) Act, 1892. While in exceptional cases the width of 36ft. might be sufficient for a street, it was very far from being an adequate standard width, and if proprietors took advantage of the Act to limit their streets to such a restricted width the city and town improvement schemes of to-day would in number represent but a mere fraction of the number of improvement schemes which would be required in the future. It might be observed from the section of the Act mentioned that houses could be erected in new streets of a height measured to the roof of the highest habitable room equal to 1½ times the width of the street; consequently, four-storey tenements 45ft. in height might be erected on such streets, and the district built upon in such restricted lines, with the free space behind the houses to correspond, would, from a sanitary point of view be too dreadful.

City Streets and Town Streets.

The Act should discriminate between the widths of streets in towns and those in small residential burghs. In towns the widths should not be less than 80ft. for carriageway and footways, except in cases where the streets were short and could not be extended, in which case the minimum width might be reduced to 50ft., and in a few very exceptional cases, where the Commissioners were satisfied that from the peculiar nature of the surroundings a greater width could not be obtained, a minimum width of 36ft. might be permitted. Where tramways, sewers, gas and water pipes, electric-lighting cables, underground telephone wires were in contemplation a width of 60ft. was required. In some of our cities they had instances of streets 70ft., 80ft., and 100ft. in width, and it was to be regretted that these widths were not more frequently adopted. Apart from the width required for the utility of the street, a sufficient width was required for free space in front of the buildings to be erected thereon, adopting the standard provided for by section 170 of the Act. In purely residential districts a less width for carriageway and footways might be required, because in such districts tenements had usually parterres in front, which were parts of the street so far as free space was concerned. The width would therefore fall to be determined solely by the traffic demands. Regarding the levels of streets, the powers of the Commissioners were ample, as it was left for them to fix the levels. It seemed strange that absolute power should be given to fix the levels and no power whatever in fixing lines. He suggested that in the event of new streets being formed as private streets section 133 should be amended and made more explicit, as its meaning was not clear.

Some Suggestions.

When the Burgh Police (Scotland) Act, 1892, was revised, he urged that an effort should be made to give the Commissioners more control than they had at present in the laying-out of new streets. He also suggested that in applications to the Dean of Guild Court for laying-out new streets the procedure should be much the same as in applications for the erection or alterations of new buildings, so that all proprietors bounding the property or estate on which it was proposed to lay out a new street would be cited and have an opportunity of asking the court for any modification of the lines or levels, or both, that might be necessary for the purpose of working in with contemplated lines of streets on their properties. In cases where the lines of proposed streets were at a considerable distance from any of the boundaries of the estate or property adjoining proprietors might not require to concern themselves, but on the other hand, when they were near the boundaries, it would be necessary for them to see that the proposed levels would work in with their feuing designs, and if not they could ask the court to modify the lines for that purpose. The court would also have an opportunity of ensuring that the lines of proposed streets were so fixed as to provide for ample free space being left behind the houses to be built along the streets, and thereby make easier the carrying out of section 170 of the Act. Should the petitioner in any case be refused lining on the ground that he objected to modify his lines to suit the requirements of the Dean of Guild Court, he could appeal to a higher court.

Mr. W. F. Mackintosh, of Arbroath, next read a paper on

"Legal Procedure in Making Streets."

He said the Police Act of 1892 was very defective in regard to the definition of the term "new street," and was not wide enough to cover the cases of houses being built along a public road or path already existing. If he was right in the case which he quoted the Commissioners had practically no control with regard to building along such a road or path. The position of the first house greatly determined the position of those succeeding, and streets usually sprang up by degrees. The position of matters was this—If a person was proprietor of a field of virgin soil and wished to let it or build houses on it, he must give notice to the Commissioners that he intended to lay out a new street, and, along with such notice, lodge plans and sections showing the proposed levels and drainage in order that levels and width might be fixed; but if there ran through this virgin soil a road or path, say, 20ft. wide, along which no houses existed, and he chose to build or let on each side of the road, the Commissioners had no control over the levels, gradients, drainage or width of this road, which, although it was not a new street under the Act, might be of considerable length and might thus become a busy thoroughfare. It was quite true that the proprietors whose land adjoined the road might of their own accord choose to convert the road into a street in conformity with the Act. Failing their doing so, the Commissoners' only course, so far as he could see, was under section 154 to purchase and acquire sufficient ground themselves in order to widen or improve the street, resorting also, if purchase could not be effected, to the compulsory powers of purchase conferred on them by that section. This, however, would have to be done at the public expense. He advocated that Commissioners should have power of fixing the line of streets or approving or disapproving the proposed line.

Private Streets.

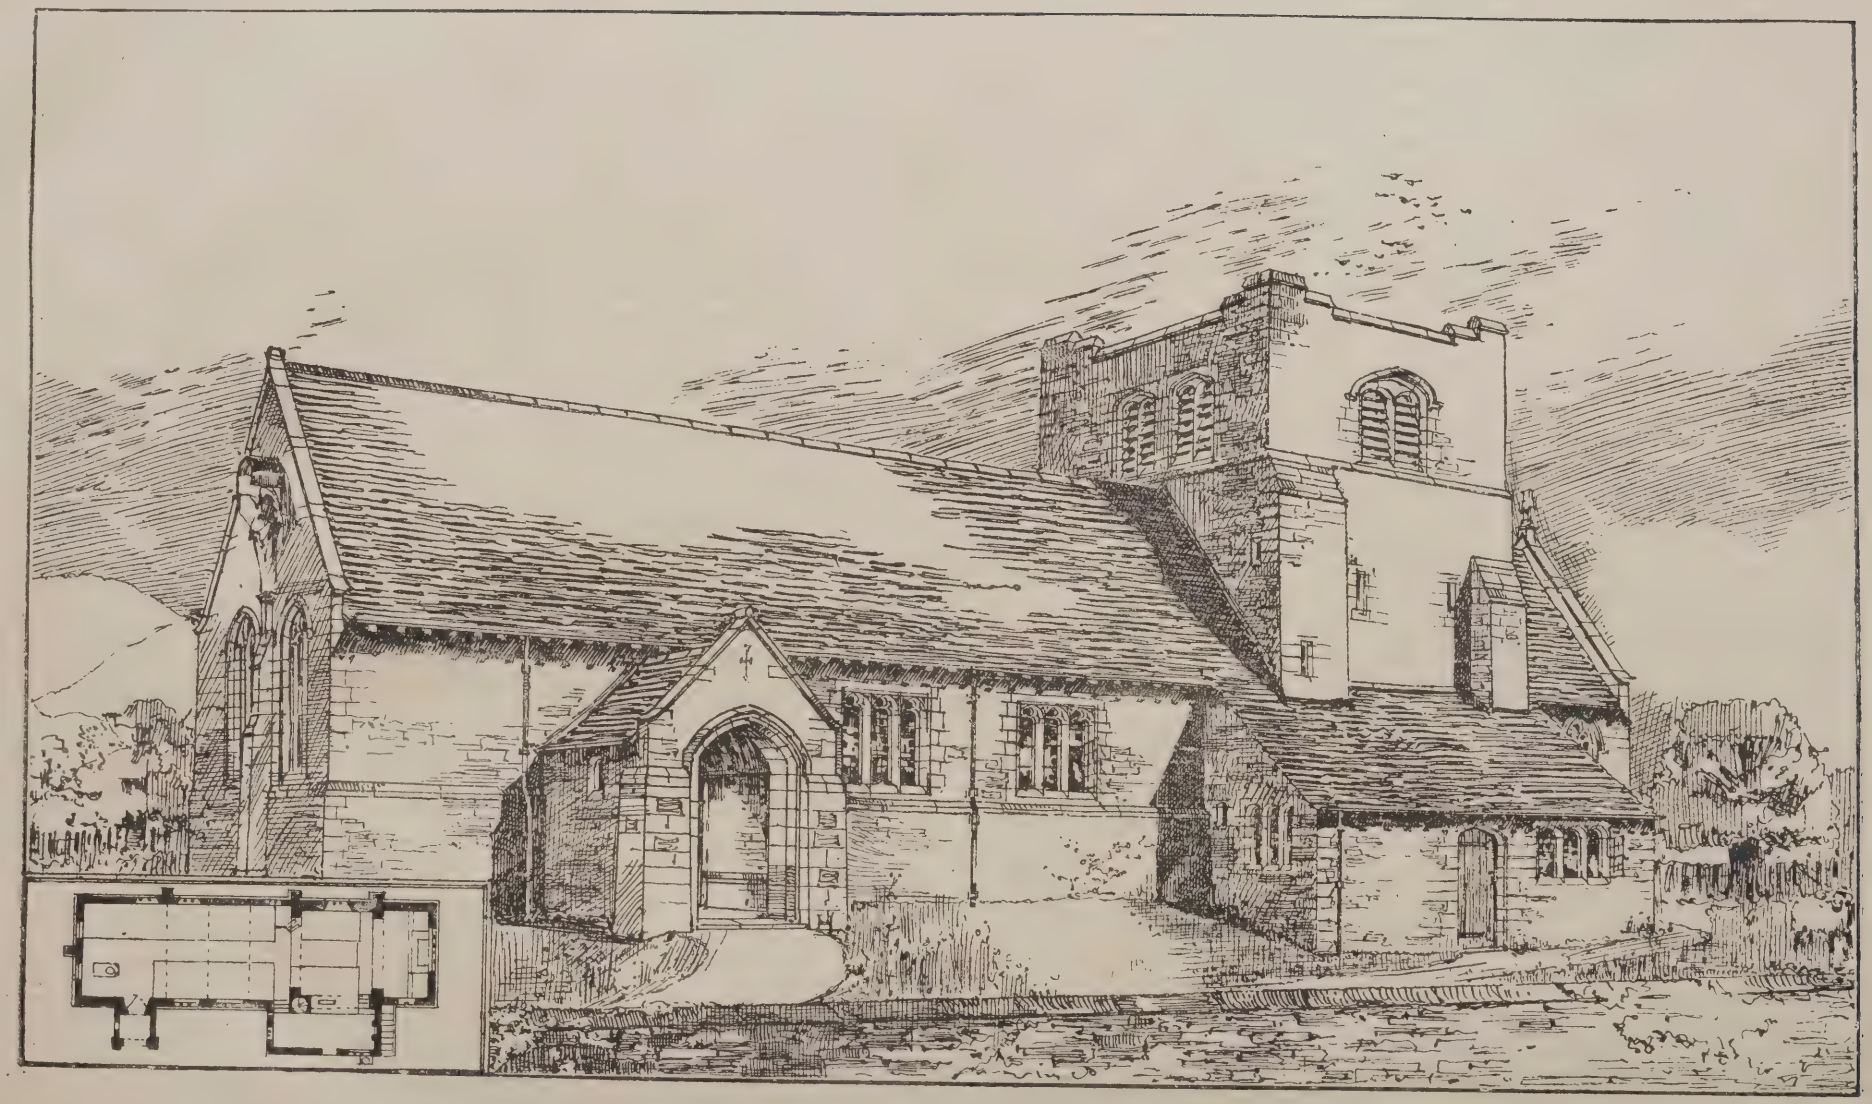
He next dealt with the question of the formation and completion of private streets and of the veto which the owners of three-fourths of the frontage could exercise in refusing to allow the street to be macadamised. The object of section 139 was not only to provide relief to the owners, but also, while enabling the Commissioners to give that relief to owners—a relief that might amount to total exemption—to put the Commissioners in an unassailable position in respect of having given such relief, and put themselves beyond challenge on the part of adjacent owners, who would have to pay a larger sum for street making on account of the relief so given. With regard to the various modes of street making and equitably ascertaining, the costs of an arbitration under section 151, it would be observed, as a manifest defect in the Act, that the Act contained no provision instructing notices to be served on the proprietors of the ground along which the street was to run, or on the owners of buildings already erected intimating the Commissioners' intention to pave or make the street either temporarily or permanently. There could be no question that if the Commissioners proceeded to execute the work without giving notice they could not afterwards recover the expenses of street making. But even when notice was given, if that notice did not specifically detail the mode on which the work was to be done, the same result would follow.

Surveying and Sanitary Notes.

A Subway at the end of Parliament Street is being constructed by the Westminster Vestry in order to connect Bridge Street with Great George Street.

A Proposed new Street in Liverpool, between Bath Street and Great Howard Street, is under the consideration of the Estate and Health Committees of the Corporation.

The Strand "Island."—The footway of the new Strand widening is ready, and very shortly the roadway will be thrown open for traffic. The unsightly backs of the Holywell Street houses have been covered by a hoarding, which has been papered with select designs relating to fluid beef, soap, whisky and other delicacies.



Roads Up in London.—The City end of the Embankment was closed last week for repairs. Buckingham Palace Road is also given over to the road-breaker in the neighbourhood of Victoria Station. Chancery Lane is emerging from its wooden barricades. Waterloo Place and the lower end of Regent Street are still in the hands of the pavior.

The "Cyroplane" is a new tripod head for photographic cameras or surveying instruments, which allows the camera, level or theodolite to be inclined without moving the feet of the tripod. The device will support a camera 18in. by 24in. in dimensions. The cyroplane is the invention of M. Simmonet and is made by M. Balbreck, 137 Rue de Vaugirard, Paris.

A Defective By-law.—At the City Summons Court, last week, Edward Winter was summoned under the new L.C.C. by-law for cleaning a window to the danger of passengers in Liverpool Street. A police-constable said he saw the defendant cleaning a window about 15ft. from the ground without any support but the ledge on which he was standing. The manager of the National Provincial Window-Cleaning Company said the defendant carried life-guards, which he used when necessary. He was standing in a safe place. The defendant raised an issue which revealed a weak point in the by-law. The policeman admitted that he was standing on a coping, but said there was no window-sill. Alderman Sir G. Faudel-Phillips read the by-law, and found that under that the offender must be standing on a window-sill; he dismissed the summons.

The Bath Surveying Committee met last week. Two builders, for alleged infringements of the by-laws, came before the committee, and among plans passed were those for alterations to the corner of Milsom Street, submitted by Mr. Mallett. It was reported that the houses up to and including No. 5 London Street were now in the possession of the committee, and the surveyor was instructed to commence pulling down the houses up to and including No. 2 London Street and lay out the new kerb line. From the Streets Improvement Committee it was reported that the surveyor had submitted an offer by Mr. Gifford to sell a strip of land adjoining Lansdown Road, at Lansdown Lodge, and rebuild the boundary walls, for the sum of £200. The offer was accepted, Mr. Young saying it was one of the best improvements they had had for a long time at small cost.

A Proposed Isolation Hospital at Ecclesall.—Mr. J. D. Webster, architect to Ecclesall Union Board of Guardians, is to prepare and submit a plan and specification for a hospital for isolating suspected infectious cases.

ALL SAINTS' CHURCH, RUFFORTH, YORKSHIRE. DEMAINE AND BRIERLEY, Architects.

Keystones.

Greenan Castle, which stands on an isolated volcanic rock on the seashore three miles south-west of Ayr, has been undergoing extensive repairs for its preservation. The work will cost about £200.

Clayton Old Hall.—The Parks and Cemetery Committee of the Manchester Corporation have decided to expend £900 on the restoration of Clayton Old Hall, according to plans submitted by Mr. A. Darbyshire, of Manchester.

Greenhead Parish Church is being enlarged by the addition of a chancel and organ chamber, at a cost of £1,800. There will also be a new roof, wood block paving, wooden spire and archway over the west tower, and window, costing £1,000.

Ayr new Parish Church is to be extensively altered. It is proposed to entirely reconstruct the back of the church, with a view to the accommodation of a new organ, to cost £1,000, a chancel for the choir, and a new vestry. The total cost will be £1,500.

Mr. William Millar, author of "Plastering, Plain and Decorative," has resigned his position as teacher of plastering at the Polytechnic, Regent Street, W., to accept the appointment of examiner of plastering at the City and Guilds of London Institute.

A new Parish Room at Sawley, near Ripon, has been opened. The building is oblong, and is built of freestone, given by the Sawley Hall estate. Its dimensions are 28ft. by 23ft., the height being 16ft. The roof is slated. At the front is a balcony, supported on iron pillars.

A Memorial Window has been placed in Kinclaven parish church to the late Dowager Marchioness of Lansdowne. The three-light window is placed in the west end of the church. The style adopted is Free Renaissance. The work was executed by Messrs. Clayton and Bell.

Protection of St. Paul's Cathedral against Lightning.—The rearrangement of the system of lightning conductors on St. Paul's Cathedral, which has been carried out under the direction of Mr. Killingworth Hedges, M.I.E.E., is now practically complete. The system adopted is described in the BUILDERS' JOURNAL for April 25th last.

The new Théâtre Français.—The scaffolding of the reconstructed theatre is being slowly taken down and the outer portion of the building is complete. The interior is not so advanced. The painted ceiling of Dubufe, which was saved from the fire, will be replaced in the "foyer" in the course of a few days. The shelves of the library and the box office are quite ready, and the lift—a novel feature—will be tried in a fortnight.

A new Catholic Church at Lowestoft is being erected in Gordon Road. The building will consist of red brick with Costessey ware dressings, and will provide accommodation for 600 persons. The site was purchased for £1,600, and the cost of the building will be £9,000. It is 161ft. over all, 53ft. wide, 22ft. nave, and 13ft. aisles. It will also have a square tower and arcading supported by polished granite columns. Messrs. Baines, of London, and F. W. Richards, Lowestoft, are the architects, and the contractors are Messrs. G. E. Hawes and Sons, Norwich.

A Club is to be erected in Bank Street, Alexandria, Glasgow, for the Vale of Leven Constitutional Club, from plans by Messrs. Boston, Menzies and Morton, architects, of Alexandria and Greenock. The site is in close proximity to Alexandria Railway Station. The ground floor will be utilised for offices, billiard room for four tables, and lavatory accommodation. The upper floor will be occupied with a large reading and recreation room, committee room, and baths, while in the attic floor a house is provided for the caretaker. The buildings will cost about £2,300. The contractors for the work are:—Mason, Robert Bisland; joiner, James Shearer; slater and plasterer, James O'Conner; plumber, Thomas Taig—all of Alexandria.

A Statue of Edmund Cartwright, D.D., the inventor of the loom, is to be erected at Bradford. Mr. Henry Fehr has been commissioned to execute the work.

The Ruskin Exhibition at Coniston, owing to its still increasing popularity and in response to numerous requests, is to be open for another week, and it therefore will close on September 15th.

A new Lunatic Asylum near Basingstoke is proposed to be erected by the Hampshire County Council at Sherborne St. John. Permission has to be obtained from the Commissioners in Lunacy and the Secretary of State.

The Society of Designers will hold a number of meetings during the coming session in Clifford's Inn Hall as formerly. There will be about three lectures on as many branches of decorative design, and various other meetings of an informal character.

A Bronze Tablet to Sir H. Ponsonby has been erected in the north transept of Whippingham Church by the Queen in memory of her devoted private secretary. The memorial has in the centre a medallion portrait of the late General. On each side stands a knight in armour. The work was designed by the Countess of Gleichen.

The Rebuilding of the Grand Theatre, Islington, has been commenced by Messrs. Charles Dearing and Son, of the Clarence Works, Halliford Street. Mr. Frank Matcham, the architect, is endeavouring to have the work completed by November 30. The disastrous fire did not necessitate entire rebuilding, but it is estimated that the place will not be reinstated under £10,000.

The Proposed Memorial to Oliver Goldsmith over the grave in the Temple Churchyard has been met by the enquiry whether the exact spot where he was interred is known. The stone which is supposed to mark his resting-place was erected in 1860, but its situation is, it appears, to some extent conjectural. The register of burials only says, "Buried 9th April [1774] Oliver Goldsmith, M.B., late of Brick Court, Temple," and the tablet to his memory, erected in 1837 in the church itself, simply records the fact that he "was buried in the adjoining churchyard."

The Church Crafts League have issued a leaflet giving an account of its objects and methods. At the recent half-yearly meeting, held under the presidency of the Bishop of Rochester, Mr. Anning Bell and Mr. Mouat Loudan, the well-known decorative artists, and Mr. Harrison Townsend and Mr. Leonard Stokes, architects, were elected as artist members. Membership of the League is open to ordinary members on payment of a small annual subscription. Those desirous of further particulars should write to the secretary, Mr. Francis Burgess, at the Church House, Dean's Yard, Westminster, S.W.

Baxter's House at Acton, opposite St. Mary's Church, is being pulled down to make way for a branch office of the London, City and Midland Bank. It is said that Baxter, the well-known Nonconformist divine and writer, lived here after the Restoration. The back part of the building undoubtedly dated from the Stuart period. The front portion, facing High Street, although possessing its ancient gable, had been very much altered, and its brickwork painted white. The old garden has entirely disappeared, and the picturesque gable is shored up to prevent its falling while the workmen are engaged in putting up the new building.

A new Liberal Club at Winsford is being erected in Siddon Street by Messrs. Dickinson and Johnson, local builders, whose tender is £1,049. The work is stipulated to be completed by March next. The club is to contain a smoking-room, a billiard-room to hold three tables and a reading-room on the main floor; and a debating-room or public room above. In addition there is to be a well-laid-out bowling-green at the rear. The plans have been prepared by Mr. Rowland Stubbs, who is now a member of the Imperial Yeomanry serving in South Africa, and Mr. Blagg has been appointed in his stead as clerk of the works.

The Middlesex Hospital is undergoing extensive alterations.

A New Dispensary Building at Exmouth, Devon, is to be erected at once from designs prepared by Mr. Ernest E. Ellis, architect, The Strand, Exmouth.

"Builders' Journals Wanted."—The publisher will be pleased to send a copy of the current number of the "Architectural Review" to any reader in exchange for "Builders' Journals" of the following dates:—February 8th and 15th and April 19th, 1899.

Visits during the British Association Meeting at Bradford will be paid to Bolton Priory, Farnley Hall, which contains many of Turner's works, Ilkley, where are Saxon crosses and a Roman camp, Haworth, with its Brontë museum, Knaresborough, and the cave of Eugene Aram, Kirkstall Abbey, the Ackton Colliery, and other places.

Competition for Wesleyan Day Schools, Banbury.—In a limited competition by six architects the plans of Mr. W. F. Bird, of Midsomer Norton, Somerset, have been selected by the trustees. The author of the set placed second receives fifteen guineas, and the author of the third set ten guineas. The new buildings are to provide accommodation for about 500 children, and are expected to cost about £3,500.

The Tivoli Variety Theatre, London, has been undergoing various alterations recently. The buffet, between the main entrance hall and the Tivoli Restaurant, has been merged into the theatre, and the space utilised in making a grand entrance hall, 30ft. by 17ft., and a vestibule 27ft. by 9ft. Additional exits have also been made direct into the Strand. The grand circle saloon is newly decorated in the style of Louis XIV., and the ventilation greatly improved by adding an alcove, with a window opening direct into the open air, whilst an air shaft has been carried above the roof.

In the Cathedral of St. Paul at Calcutta a new episcopal throne has been placed as a memorial of Bishop E. R. Johnson's twenty-one years' tenure of the See. The woodwork is principally of teak on a white marble base, and is octagonal in form, with many niches, gables, and crocketed finials. Small statues, representing the four Greek and four Latin Fathers of the Church adorn the canopy, and the whole is surmounted by a poppy-head finial. All the carved work except the figures was executed in Calcutta, and a great deal of it was done by Chinamen. The figures were carved in London, and the designs were prepared by Mr. E. Thornton.

The Clergy and Artists' Association will hold their fifth annual Church Congress Exhibition at Newcastle-on-Tyne during the Congress week in the smaller hall of the Geographical Society (close to the Congress Halls), which has been lent to them by the authorities for the occasion. The exhibition will include sculpture, painting, glass (cartoons), architectural work, metal work, embroidery, &c., and the aim as before will be to bring before the public examples of the personal work of artists working in churches of suitable design, direction and feeling. The sending-in days at 6 Millbank Street, Westminster, S.W., the offices of the society, are September 17th and 18th, after which no submitted work can be received. Artists and craftsmen are invited to submit work.

The Byker New Police Station Competition.—A special meeting of the Watch Committee of Newcastle Corporation was held last week, to receive the report of Mr. F. H. Oldham, of Manchester, appointed at the request of the Committee by the President of the Institute of British Architects, relative to the plans sent in for the erection of a new police station at Headlam Street, Byker. There were twelve competitors. The report recommended that the architects' plan marked "Ad Rem" be accepted, that the second in place of merit was "Practical," and the third "N.E.B." On opening the sealed letters bearing the mottoes, it was found that Messrs. Cackett and Dick, of Newcastle, were the successful competitors; Messrs. Riddle and Brown, of Newcastle, had secured the second prize, of the value of £50; and the third, Mr. B. F. Simpson, receives £25.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Forming Stack Foundations.

ST. HELENS.—J. R. writes: "The accompanying sketch (not reproduced) shows a piece of ground on which we are about to erect a heavy chimney—about 1,000 tons, 65yds. high. The ground at the bottom of the excavation is soft sand, the water standing in a test hole nearly level with the top. We have bored down to water level of brook and it is still the same. (1) Is this good enough to build upon with, say, 4ft. of bag lime concrete? (2) If not, would any other thickness or quality of concrete do better? (3) Is it necessary to pile the hole for chimney foundation, and, if so, how would you distribute and what would be the size and length of piles? Some persons here assert that a soft foundation is good enough provided the bottom is all equally soft; is this so?"

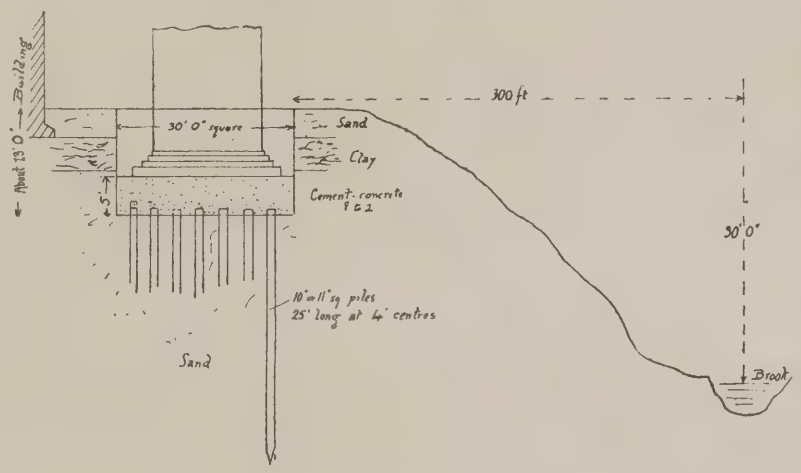
This is evidently a case for bearing piles, as drainage may take place into the brook through the superincumbent weight of the stack or from natural causes. As the existence of a hard strata below the soft sand is not indicated (if such had been the case the foundation site might have been enclosed with sheet piles driven into the hard strata, thus preventing the escape of the sand) it is advisable to drive, say, fifty piles about 10in. or 11in. square and about 25ft. long when driven to such a depth as would bring their points, say, 5ft. below the bed of the brook; they should be longer if found to give too readily to a reasonable drop of the hammer. The piles to be spaced about 4ft. centres and the area of the ground to be about 900ft. super, excavated as shown in the accompanying sketch. The total thickness of the cement-concrete under the stack is 5ft.—4ft. over the heads of the piles. The heads are to be cut off below low-water mark in the pit; no heads and sills will be required. The ground to be excavated to 12in. below the top of the piles. In reply to the assertion that a uniformly soft foundation is good enough, this does not apply in this case or to such a structure as a chimney subject to larger forces than its own weight distributed over less than one-half of the foundation area resulting from the external pressure of the wind.

H. N. LEASK, C.E.

Ancient Lights.

STOURBRIDGE. — WORCESTER ENQUIRER writes: "I am proposing to build as close as possible to some existing ancient lights. Can I determine the position of the new buildings by setting off a line from the window sill at an angle of 45deg., and arranging the top of my building clear of this? Is it also necessary to give light horizontally as well as vertically at an ang'e of 45deg.?"

Our correspondent cannot determine the position of his new buildings in the way proposed. There is no conclusion of law that a building will not obstruct the light coming to a window if it permits the light to fall on the window at an angle of not less than 45deg. The amount of obstruction is always a question of fact that depends upon the evidence; but the fact that 45deg. are left unobstructed may, under ordinary circumstances, be considered *prima facie* evidence that there is not likely to be material injury. But the question always is, "Will the new building cause a substantial privation of light, sufficient to render the occupation of the premises uncomfortable; or prevent the occupier from carrying on his accustomed business as beneficially as he has previously done; or prevent the premises from being used for any other purpose for which they may be reasonably considered available?"



H. P. B.

Law as to Water-Chutes.

WICKHAM, HANTS.—T. R. K. writes:—"My next-door neighbour has *forcibly* removed my water-chute and the iron supports from my wall and thrown them over into my garden, doing much damage to the fruit trees. Have I power to prosecute him?"

Querist does not say where the wall is, but we shall assume it to be a boundary wall between his premises and his neighbour's. If he has a right to have a water-chute on the wall in question, and to discharge the water from his own premises through that chute on his neighbour's premises, then his neighbour has been guilty of a trespass for which an action will lie, and for which, if he did it wilfully or maliciously, and not under a reasonable supposition of right, he may be prosecuted summarily before a Justice of the Peace if the injury done does not exceed £5. If he did it unlawfully and maliciously, and the injury exceeds £5, then he may be indicted for a misdemeanour. Whether our correspondent has such a right or not will depend upon circumstances. If it has been granted to him or his predecessors in title by a deed executed by his neighbour or his neighbour's predecessors in title, or if the right has been exercised without interruption for twenty years, then his neighbour cannot dispute his right. It is also to be observed that even if his neighbour were justified in removing the chute and supports he would not be justified in injuring the fruit trees in the process, unless such injury could not, by reasonable care, have been avoided.

H. P. B.

[FORMING STACK FOUNDATIONS.

Duties of a Surveyor.

HEYWOOD.—F. F. writes:—"I am anxious to ascertain how far I am capable of undertaking the duties of a surveyor, being offered such a position under a small borough authority. (1) Can you give me any information as to how to pass the examinations, if any, of the Institute of Civil Engineers, and the books I should study to enable me to pass these? (2) What should I do to obtain a certificate as a qualified nuisance inspector and sewage works manager?"

(1) Detailed particulars of the examination may be obtained from the Secretary, Institute of Civil Engineers, Great George Street, Westminster, London, S.W. It is essential that candidates should possess a good general education and a sound knowledge of mathematics. The professional portion of the examination consists of theoretical and elementary applied mechanics, theory of structures and the strength and elasticity of materials, together with an optional subject, such as geodesy, hydraulics, theory of heat-engines, metallurgy, geology and mineralogy, stability and resistance of ships, thermo- and electro-chemistry, or electricity and magnetism. The following works may be studied with advantage:—Rankine's "Civil Engineering" (Griffin and Co.); Rivington's "Building Construction"; Ganot's "Physics" (Longmans, Green and Co.), and such other text-books as refer to the particular subject or branch of engineering you desire to take up. (2) Write to the Secretary, Sanitary Institute, Margaret Street, London, W., for a syllabus of the examination for "Inspectors of Nuisances." Before accepting a responsible post as borough surveyor, your best course would be to first obtain an appointment as assistant to the borough engineer of a large town, so that you may obtain sufficient practical knowledge and experience to fit you for future duties and responsibilities.

T. E. C.

Bacterial Purification of Sewage.

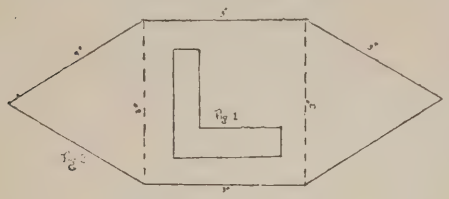
DUNDEE.—DRAINAGE writes: "Can you give me the name of any book describing the various systems for the bacterial purification of sewage, and the names of firms undertaking the fitting-up of the necessary tanks? The notes in 'Specification,' No. 4, are not sufficiently full for my purpose."

An excellent work on the subject is "Sewage, and the Bacterial Purification of Sewage," by Dr. S. Rideal (R. Ingram, Pleydell Street, Fleet Street, London, E.C.). There are many makers and patentees of systems and apparatus for bacterial sewage purification. The following firms, amongst others, make a speciality of fitting up sewage tanks or filter beds: Messrs. Adams and Co., 7 Old Queen Street, Westminster, London, S.W.; Messrs. Cameron, Commin and Martin, 7 and 8 Bedford Circus, Exeter (septic tank system); The Sewage and Effluent Water Filtration Company, Limited, 35 Waterloo Street, Birmingham (Lowcock's system); F. Pullen Candy, The Cutting, Redhill, Surrey (Candy's system); and The Magnetite Sewage and Water Purification Company, Limited, 33 Barton Arcade, Deansgate, Manchester.

T. E. C.

Ionic Order at Eleusis.

DERBY.—E. J. D. writes: "I should be obliged if you could give me any information about the Ionic Order at Eleusis illustrated in Mr. Phenè Spiers' 'Orders.' A plan of *a* temple at Eleusis is illustrated in Fletcher's 'History' (Plate 18, Plan No. 2), but this does not agree with the detail drawing by Mr. Phenè Spiers. A reference to any book to be found in the R.I.B.A. library would serve my purpose, but there are probably other students interested in this matter."



This example of the Ionic type was first published by the Dilettanti Society in the "Unedited Antiquities of Attica," 1817; and later in the works of Normand, Mauch and Spiers, who seem to have copied each other in turn. The fragments from which the Order has been drawn were discovered while excavating within the vestibule of a small Roman gateway leading to the sacred precincts of Eleusis. The caps and architrave stones are quite plain on one side, which seems to indicate that the columns were placed near or against a wall, but nothing, I believe, is known with certainty as to their original position. A plan of the gateway, with other details, will be found in the "Unedited Antiquities of Attica." The small temple referred to by "E. J. D." was outside the precincts, pseudo-Doric, of the Roman period.

J. A. M.

Names of Diagrams.

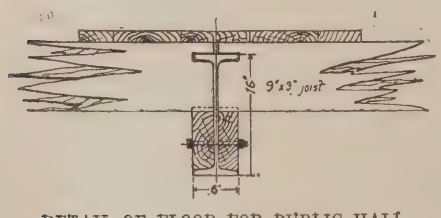
BOW, E.—E. G. writes: "What are the technical names of the two accompanying diagrams? I have heard No. 2 described as an oblong hektogen."

Fig. 1 is a recto-reflex rectangle. Fig. 2 is

UNUSUAL DIAGRAMS.

a hexilateral rhombus inscribed on a square centre lobe. The name given by querist does not completely define the figure. H. D.

Deadening Sound through Walls.



RUGBY.—DUBIUS writes: "What, in your opinion, is an effectual remedy for preventing sound through a party wall composed of two 4½in. walls with a 2in. cavity between? The cavity, as it is, seems to have no better effect upon deadening sound than a solid 9in. wall. Is there anything that could be fixed upon the face of the wall before papering, or can you suggest any other means of deadening the sound?"

It would have been better to have built the party wall solid; walls of less than 14in. should not be built with a cavity. We can only advise our correspondent to try covering his wall with felt, asphalt or Willesden paper; the best, but most expensive, method would be to fill the 2in. cavity with asphalt or one of the patent building compositions on the market. Probably if the wall in question had been built with an ½in. cavity filled up with building composition the trouble would not have arisen. A paper on "Sound in its Relation to Buildings," by H. W. Burrows, can be obtained for one shilling at the offices of the Royal Institute of British Architects, 9 Conduit Street, W.

Floor for Public Hall.

DUBLIN.—J. MAC writes: "I enclose a tracing (not reproduced) showing the plan of a public hall. I propose to put the joists (9in. and 3in.) lengthways, to rest on two box girders supported in the centre by two columns. Will this construction be safe for an audience of about 350 or 400 persons, allowing for dancing? The walls are of stone 2ft. 6in. thick."

I consider that, taking the floor at 1¾ cwts. per foot super, two 10in. by 5in. rolled steel joists placed side by side with a 12in. by ½in.

DETAIL OF FLOOR FOR PUBLIC HALL.

plate riveted on top would be more than sufficient to carry the load. The columns, if of cast iron, should be of 7in. diameter, 1in. metal, on the assumption that they are 12ft. long. The 9in. by 3in. wooden joist over 21ft. would make a very springy floor. Treadgold gives, according to "Molesworth's Pocket Book," 12in. by 3in. for 20ft. span. A much better construction would be to place a 16in. by 6in. rolled steel joist over the piers; they would then be about 7ft. apart, and no columns would be required. The accompanying sketch is a section through 16in. by 6in. girder.

BREES VAN HOMAN.

Mr. J. Farquharson, A.R.A., has been presented by the tenantry and other friends at Finzean, Aberdeenshire, with a solid silver palette and easel, in testimony of the donors' gratification on the occasion of Mr. Farquharson's election to the Royal Academy.

Law Cases.

Dispute between Surveyor and Builder.—The case of *Stevens* v. *Seaber* was heard at the City of London Court on August 29th. The plaintiff is a surveyor and claimed for £27 14s. 6d., the balance of an account due for work done. The defendant was a builder, and in 1890 he had certain outstanding contracts. He had disputes, and he came to the plaintiff and represented to him that he had a valid and substantial claim for extra work in connection with the contracts. Relying on his statements the plaintiff agreed to act for him. The first dispute went to arbitration, and the matter was decided against the defendant. At that time the defendant came to the plaintiff and said it was impossible for him to go on with his arbitrations without some funds, as the solicitor had refused to continue to proceed. The plaintiff advanced £9 to the defendant, who had since made payments on account, leaving the balance sued for due. The defendant's plea was under the Statute of Limitations, but the Deputy Judge found against him on all the points which had been raised, with costs, and refused to stay execution with a view to an appeal.

Ancient Lights Case.—On Wednesday last the case of *Hustler* v. *Farnsworth* came before the Vacation Judge on a motion by the plaintiff for an injunction to restrain the erection of buildings at Leeds so as to interfere with the light and air enjoyed by the tenant of the plaintiff's buildings. The plaintiff's tenant was a furniture dealer and upholsterer at Leeds, which business had been carried on since 1874 or 1875. Opposite had been a low building, about 20ft. high, of one storey. The light to the plaintiff's building was therefore good, and the plaintiff desired that that good light should continue. The street was 39ft. wide. The defendants had bought the land opposite, and had pulled down the low building, and begun to erect a building about 30ft. high. The question was: What light had the plaintiff been having? Mr. Birrell, Q.C. (for the defendants), said he relied on the question of lâcher; the new building was started seven months ago, and the plaintiff had had the plans. Mr. Badcock (plaintiff's counsel) observed that as soon as the building got 6ft. above the ground the plaintiff gave the defendants warning. On July 21st they first found out what the height of the new building was going to be, and they gave notice immediately. If his friend would undertake not to build until the motion came on, the plaintiff would be satisfied. After some other observations, it was agreed that the motion should stand over until the trial of the action, which should take place and be argued upon the footing that the building was of the same height as it was that day.

A Sinking City.—The Northwich Salt Compensation Board, which relieves property owners whose buildings have subsided through brine-pumping, last week adjudicated upon claims, of which seventy-one have been made during the last twelve months, amounting to £2,800 approximately. Grants aggregating £1,400 were made, while a considerable sum was devoted to commutations and purchase of sinking property, a policy which will gradually reduce the claims.

An Art Gift to Liverpool.—At the meeting of the Library, Museum and Arts Committee of the Liverpool Corporation on Thursday, Sir W. B. Forwood presiding, it was agreed to accept a gift of art treasures valued at over £30,000 offered by the executors of the late Mr. Hugh Frederick Hornby. The collection includes a library of art books published within the last hundred years, valuable engravings, autographs, &c., and it is to be located as a separate collection for the benefit of the art-loving public of Liverpool. On the death of the survivor of the executors the sum of £10,000 will be payable to the authorities to assist in providing a building in which to store the collection, so that it may be exhibited to the public.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"'Tis the keystone
That makes the arch: the rest that there are put
Are nothing till that comes to bind and shut.
Then stands it a triumphal mark, then men
Observe the strength, the height, the why, the when
It was erected; and still walking under,
Meet some new matter to look up and wonder."
—BEAUMONT AND FLETCHER.

Our Plates. THE two churches by Messrs. Demaine and Brierley, of York, show how dignified a simple treatment can become when in competent hands. A "Men Who Build" article dealing with the work of these architects was published in our issue for July 25th last. The design by Mr. Alexander Fisher was executed in translucent enamels set in a frame of beaten and polished steel. Mr. Ernest Newton's design for a house at Woking is a reserved piece of domestic work, very pleasing.

Discordant Buildings. IN a recent number we commented on the new guard-house at the Tower. Our remarks received the attention of Mr. Labouchere in "Truth," and, later, of the London correspondent to the "Birmingham Daily Post." In a letter to this newspaper "W. J. P." says:—"When your London correspondent has done with the 'Cockney Monstrosity' I should like him to come down to Birmingham and start a crusade against the same evil. He will find plenty of scope for his energy, and plenty of excuses for losing his temper. I can sympathise with his indignation at the sacrilegious treatment of the Tower of London, but we are suffering almost as much in Birmingham in proportion to the size of the place. We have red brick and terra-cotta wedged in between buildings of stone, and without the slightest regard to locality or consistency with the surroundings. From the way in which Birmingham has recently been covered with this red brick and terra-cotta, one would almost think that builders and architects had some special interest in pushing forward these materials on every conceivable opportunity. About the most glaring attempt of the kind occurring recently is, I think, the proposal to rebuild the Temperance Hall in red brick and terra-cotta. It is such men as these who, if they had their way, would rebuild Westminster Abbey with red brick and terra-cotta. I am convinced that there is only one way of waging war against this baleful practice of covering the country with 'monstrosities.' That is for a stricter supervision to be exercised over the erection of important buildings. I hope the day will come when such matters will have to be submitted to a duly constituted authority, not, as they are now, simply as regards height or projection and design, but in relation to surroundings, and that no building should ever be sanctioned which soured the harmony of existing surroundings." We may note by the way that the "Daily Mail" and the "Daily Chronicle" have followed our lead in declaiming against the new guard-house at the Tower.

The Proposed Ruskin Memorial. ON page 62 of last week's issue we dealt with the proposal to erect a portrait medallion of John Ruskin in the Poets' Corner at Westminster Abbey. In a letter to the "Times" newspaper Sir Edward J. Poynter, President of the Royal Academy, says: "Human nature demands, and always has demanded, from time immemorial, that some visible record should be preserved of the illustrious dead, and sacred buildings have among Christians by common consent been selected as the most honourable and appropriate abiding-place for such memorials. No one more than Ruskin has appreciated the exquisite works of art which this sentiment has been the means of producing. The world, unfortunately, has not kept up a succession of Donatellos or Mino-da-Fiesoles, and our great crop of heroes, 'when

each succeeding year brought forth a new one, came at an unlucky time for the art which was only too solidly to perpetuate their memory; hence the 'incoherent fillings' which everyone deplores. But if, as a committee, by the selection of the artist to be employed we have been careful that what is placed in the Abbey shall be neither obtrusive nor in bad taste, we shall have done what is necessary to safeguard the atmosphere of beauty and sanctity which still clings to that most ill-treated of buildings, and we shall have satisfied what is a very general feeling as to what seems most appropriate to Ruskin's memory." In a further letter to the same newspaper Mr. Sydney C. Cockerell says: "'Modern Painters,' the book by which Ruskin is most widely known, was originally to have been called 'Turner and the Ancients,' and is, as need scarcely be said, devoted to a study of Turner and of the Old Masters. It is in association with the works of these men, if anywhere, that Ruskin would have been proud that his features should be held in remembrance. The director and one of the trustees of the National Gallery are on the Memorial Committee. With their aid it ought not to be difficult to change the destination of the medallion to the Turner Room or to some other part of a building in which every friend of Ruskin and every student of his books would rejoice to see it."

The Coventry Guildhall.

THE mediæval hall of the old Coventry Guilds was recently wired for the electric light, and a committee has just fitted the building with several brass electroliers and frosted globes. At the last meeting of the City Council a strong protest was made by a majority of the members against the incongruous character of the fittings, as being quite out of keeping with the archaic style of the hall. The ex-Mayor (Mr. Alderman Fowler) declared the fittings were only suitable "for an East-end gin palace." In face of such opposition, the chairman of the committee which undertook the lighting promised that the Council should have the opportunity of removing the electroliers, although they would have to be paid for. This is evidently the work of some over-progressive gentlemen whose feeling for fitness and harmony is rather warped by nineteenth-century "up-to-dateness" and spick-and-span ideas of beauty.

An Historical Scottish Ruin Sold for £41.

ON Monday in last week at Edinburgh the remains were sold of the interesting historic house in the ancient and royal burgh of South Queensferry, on the Firth of Forth. It is a dilapidated, red-tiled building, and is known as Queen Margaret's Palace, and also as the Covenanters' House. The former name it owes to its supposed association with Queen Margaret, who succeeded Macbeth on the throne of Scotland. The building is in the vicinity of the Bink's Rock, the old landing-place of the ferry used by Malcolm Canmore and his Queen in their journeyings across the Forth, and, according to tradition, it was made use of by the "Saintly Queen" of Scotland when stormstayed on her way from Edinburgh to Dunfermline. Unfortunately, however, it is very doubtful, to say the least, whether the present building, or any portion of it, was in existence in the eleventh century. Indeed, it seems to belong to the early part of the seventeenth century. But the ground on which it stands was part of the ground conveyed by Malcolm Canmore, at the instigation doubtless of his pious wife, to the Abbots of Dumfermline, who again gave it to the Carmelite Friars. The building occupies about 45ft. by 30ft. of ground, and consists of three storeys—a ground flat and three flats above. About fifteen years ago it was condemned as unfit for occupation, and since then it has been allowed to fall into a still worse state of dilapidation. Last winter the burgh authorities gave public notice that owing to the building having become "waste and ruinous and a receptacle for filth," application would be made to the Court for a warrant to sell it, failing its being put into a state of repair within three months. The owners, however, seem to have given up all right and interest in it. Warrant to sell was granted by the Court, the reserve price being fixed at £20. At the auction last week the building and ground were sold for £41.

Mural Paintings at Marlborough House.

ADVANTAGE is being taken of the absence of the Prince and Princess of Wales from London to thoroughly clean and renovate the splendid paintings with which the upper walls and ceiling of the great Central Saloon at Marlborough House are decorated. These pictures deal mostly with the subject of Marlborough's great fights and are painted on the plaster direct. Some years ago these pictures and some of those on the wall flanking the great staircase had been neglected and had to be restored at considerable cost, many figures having practically to be repainted. On the present occasion nothing in the way of restoration is either in contemplation or necessary, but careful cleaning was thought highly desirable. The lower portion of the walls of the saloon are hung with tapestries, and these, too, will be carefully cleaned before the return of their Highnesses.

The Roman Bastion.

GREAT interest still centres around the recent discoveries of the old Roman bastion at the rear of St. Giles's Church, Cripplegate, and the old Roman wall within the Session House in the Old Bailey. The old City wall above the bastion, which was greatly damaged by the great City fire of a few years ago, is being repaired, and the repaired portions are being coloured to give the work an appearance of antiquity. The Rev. Prebendary Baiff, M.A., Vicar of St. Giles's, Cripplegate, who, with Mr. Deputy Baddeley, is taking a great interest in determining the course of the old Roman fortification here and elsewhere, has a most interesting theory with regard to the old culvert that was found at the base of the Roman bastion at the rear of his historic church. He believes that the culvert was a covered way for communication from within the City walls to an outer barbican situated beyond them, and shown on a reproduction of a valuable ancient map that hangs in the rev. gentleman's study. The discovered culvert is of red brick, and about 4ft. in height, and it converges from clearly-defined opposite points within the City walls to a covered chamber at the central part of the base of the bastion and branches off in the direction of the barbican. The Roman walls varied in height, and some discovered portions are only 9ft. high. The newer Roman walls, as calculated by Pennant, were 3 miles 165ft. in circumference, 22ft. high, and guarded by forty lofty towers.

Manchester Improvement Scheme.

THE Improvement Committee of the Manchester City Council has decided to recommend the inclusion in the new Corporation Bill, in addition to powers to carry out the Corporation Street improvement, a clause to enable them to remove St. Peter's Church. The question of the desirability of removing some of the older churches in the city has been mooted from time to time for twenty years, and the churches more particularly referred to were St. Mary's, St. Ann's, and St. Peter's. St. Mary's, which was built in 1753, and which had become very dilapidated, was demolished a few years ago, and the space has been converted into a pleasant garden furnished with seats. Various alterations and improvements have been carried out at St. Ann's, which, it may be stated, was consecrated in 1712. The main reason urged by those in favour of the removal of these old churches was that the population of the parishes had been reduced owing to residential property having to make way for offices, warehouses and other places of business, and the inhabitants having gone to live in the suburbs. With regard to St. Peter's, it is interesting to note that the foundation-stone was laid in December, 1788, and the building consecrated in 1794. The church stands in the centre of St. Peter's Square. It is a cruciform building of stone, and was built from designs by Mr. James Wyatt, with nave, transepts, and two north and two south porches approached by short flights of steps. Originally there was neither dome nor spire, but a dome was added in 1822, and it contains a clock and one bell. Sitting accommodation is provided for 1,000 worshippers. Over the communion table is a fine painting by A. Caracci representing the "Descent from the Cross." Not a few would be sorry to see the venerable pile demolished, but personal feelings and antiquarian tastes must needs give way if the removal of the church be regarded by the local authorities as a matter of public necessity.

Old Paris Mansions.

THE few remaining mansions of a bygone day are slowly disappearing from Paris. It was announced the other day that the old Hôtel de Luynes would shortly be pulled down, and the Hôtel de Chevreuse, on the Boulevard Saint-Germain, near the corner of the Rue du Bac, was also destined to destruction. The work of pulling down the former has just commenced. It had already suffered severely. A wing went when the Boulevard Saint-Germain was constructed, and then the opening of the Boulevard Raspail did away with the stately park in which it stood. It was built last century by the Duc de Luynes, who made of it a princely residence. Its splendid rooms, fine woodwork, the superb paintings (which cannot be saved) adorning its stairs, and the spacious gardens, which at one time extended to the Rue de Grenelle, made it justly famous. It passed into the hands of the Duc de Sabran, who restored it about thirty years ago, and added the wrought-iron gateway. The Dowager Duchesse de Chevreuse and the Marquise de Tholozan, her granddaughter, were the last proprietors.

Miniature Stone Carving.

AN example of miniature stone carving was exhibited recently at a bazaar at the Nottingham Mechanics' Hall. It is the work of Mr. William Porter, a monumental stonemason, of Nottingham, and represents, as a section complete in every detail, the east end of a cathedral. The entire structure does not exceed 3ft. in height, and is in late Gothic style of architecture, from an original design by Mr. Porter. Caen stone is the material used, together with marble in the pillars and base, and there is a window of stained glass. The whole is surmounted by a clock tower, the four faces respectively showing Greenwich, Calcutta, New York, and Sydney time. The clocks are worked from a single apparatus with concealed machinery, which is not the least important feature of the entire work. The model occupied ten years in execution, during which time Mr. Porter was following his profession in Australia, and is said to be a very excellent piece of workmanship.

Glasgow High School: Results.

IN the building construction and drawing classes at the High School of Glasgow first and second class certificates were given out at the end of the session for class work. The following were duly awarded:—Elementary stage, 12 first class and 21 second certificates; advanced stage, 5 first class and 7 second certificates; first honours stage, 1 first class and 1 second certificate; second honours stage, 1 second class certificate. The following prizes were earned under the prize scheme, 1899-1900:—No. 11, combined results:—Elementary:—1st, John McCoag (prize); 2nd, W. W. Silver; 3rd, W. McPherson. Advanced:—1st, John Sievwright (prize); 2nd, W. McCaig; 3rd, Alexander Robertson. First honours:—1st, James Reid (prize); 2nd, W. Ingram. Second honours:—1st, J. S. Crichton. No. 12, Examination answers.—Elementary:—1st, W. W. Silver (prize); 2nd, John McCoag and 3rd W. McPherson equal. Advanced:—1st, John Sievwright (prize); 2nd, Alexander Robertson; 3rd, W. McCaig. Honours:—1st, James Reid (prize); 2nd, J. S. Crichton; 3rd, W. Ingram. Of all the elementary students who were presented at the examination in May not one failed. There were only four failures in the whole department, these occurring in the higher stages, and of all the students who sat at the examination more than 50 per cent. passed first class.

DECORATION AND FURNISHING.

By FRANK MURRAY.

I.—COLOUR NOTES.

IN a brief note of this kind it will not be possible or needful to undertake the proof of an axiom on which the fundamental laws of harmony are based, and I must ask my readers to accept the proposition that all colour is derivable from three elemental primaries, viz., red, yellow and blue. Before proceeding to consider our subject in detail it will be necessary to understand clearly the composition of those infinite varieties of tones which both Nature and Art present to us, and the relationship which the colours of the palette or pigments bear to the three theoretical primaries spoken of above. A short time spent on this premise will help more than anything else to a definite knowledge of the laws ruling harmony in colour.

There is no such thing obtainable as a perfectly pure primary; it is, indeed, a matter of impossibility to define any absolute standard with exactitude. The purest primaries are those of the spectrum, and the pigments named from their resemblance to these elementary hues are always alloyed with one or more complementary tones, that is to say, with one or more of the other primaries. Having obtained three pigments as near in colour to the three primaries as our palette affords, let us suppose them applied to a wall surface in a simple geometric pattern, each colour being separated from its neighbour by a narrow defining line in white or black. The general effect will be found to be one of great brilliancy and cheerfulness, with a tendency to crudeness. If we qualify the assertiveness of the pigments by mixing with each a small proportion of the other two, a new element is brought into play, each colour will exhibit sympathetic affinities with its neighbours, and an additional richness of tint due to the complex harmony of its own composition.

The more the original tone is modified by the complementaries the more refined the harmony, and up to a point the richer the effect; but after that stage is passed the tone of each of the original hues is so subdued by the intermixture of the complementary colour that the hues gradually approach each other in tone, and the most subdued contrasts finally merge in absolute neutrals.

Analysis of Colours.

Having affirmed these propositions, our next stage will be the analysis of the colours of our palette and the relation of the pigments composing it to the scientific primaries spoken of above. We shall find each pigment is made up of at least two, and very generally three, of the pure primaries, in widely varying proportions.

We may take as an example for analysis the well-known blue pigment called indifferently French or ultramarine blue. By comparison with other pigments, and with the spectrum, we find the colour of this pigment to be a composition or mixture of the three primaries, the blue being greatly in excess, qualified by an appreciable quantity of red and a slight trace of yellow. The same method applied to the principal pigments gives results which will be conveniently shown in the following table:—

Vermilion	Nearly primary; strong yellow partial hue; no blue.
Light red	Strong yellow partial hue; slight blue.
Venetian red	Yellow partial not so strong; slight blue.
Indian red	Strong blue partial; very slight yellow.
Crimson lake	Blue partial; very little yellow; pure transparent base.
French blue	Strong red partial; yellow less.
Prussian blue	Strong yellow partial; no red.
Indigo	Large admixture of red and yellow partials.
Chrome yellow middle ..	Nearly primary; slight blue partial.
Yellow ochre	Large admixture of red and blue partial hues.

The above synopsis of the colour composition of a few of the principal pigments merits the most careful examination. By its aid we are able to lot out and assign to each a place in a scale of relationship to the fundamental primaries, and to arrive at an exact knowledge of the characteristics which differentiate them so markedly.

The quality to which I would particularly direct attention is a richness or fulness of hue, most perceptible in those pigments into the composition of which red, yellow, and blue enter. Conversely, there is no instance in which that richness is at all obvious when any one of the three primaries is absent; we may, therefore, justly conclude that fulness and harmony in colour are dependent upon the presence of the three elemental hues in combination, and the converse of the proposition may be held to be equally well established.

It is on this simple basis that the great law of harmony in colour is founded. The most elaborate treatise on the subject could but be little more than an extension of the position, and I feel confident that nearly everything useful and practical that can be embraced in the limits of this paper will be found to be a development of this law of harmonic combination.

Advancing a step nearer to a practical application of the principles above enunciated, we will proceed to suggest some experimental essays.

By taking three pigments that bear the closest relationship to the pure primaries, the following examples (each representative) will illustrate the principles of harmonic composition. We will begin these instances with a colour scheme involving the use of two primaries as dominant colours with the third latent. Suppose we select cobalt blue and cadmium yellow for the two primaries; by a judicious introduction of madder red as the complement in the triad of original colour, a delightful harmony of subdued contrast in orange and warm blue would result.

1. CONTRASTING PRIMARIES.

Blue (Cobalt) Plus Cadmium and Madder. — Yellow (Cadmium) Plus Cobalt and Madder.

Resulting Harmony. { Soft Warm Blue } contrasted with { Soft Toned Orange.

2. CONTRASTING PRIMARIES.

Yellow (Cadmium) Plus Cobalt and Madder. — Red (Madder) Plus Cadmium and Cobalt.

Resulting Harmony. { Soft Warm Green } contrasted with { Neutral Orange.

These are only slight illustrations of the principles upon which combinations may be produced *ad infinitum*, all being significant of the fundamental law that every hue shall express in its own composition a sympathy with and indebtedness to the three primal notes of the chord—red, yellow and blue.

So far I have dealt with the theoretical basis of colour harmony, and now propose offering some

Practical Suggestions

on the arrangement of schemes and the compounding of colours.

The infinite number of hues produced by the combination of the three primaries are very conveniently arranged in two classes—secondaries and tertiaries. Having already shown at length the constitution of the primaries, we can proceed to define the secondary as that tone which is produced by the compounding of any two primaries, and a tertiary is the rich blending produced by an admixture of the three primaries. There are three classes of secondaries, arrived at by the compounding of red and blue—result, purple; red and yellow—result, orange; and finally a combination of yellow and blue, which produces a green.

The secondaries may therefore be summed up as orange secondaries, purple or violet secondaries, and green secondaries. It should be noted that these secondaries never pass one into another: any great disproportion of the compounding hues destroys the distinctness of the secondary quality, and they revert to more or less slightly modified primaries. We may state in passing that a number of the pigments are of this order.

As previously mentioned the harmonic tone resulting from any compound of the three primaries is named a tertiary, and it is at once obvious that an infinity of hues are thence derivable. For convenience they may be arranged in six or more classes, according to the predominance of either or both of the primary colours, and may be nominated thus:—

One primary predominating	Red Tertiaries Blue „ Yellow „
Two primaries predominating ..	Orange Tertiaries Green „ Violet „
Three primaries balancing	Citron Tertiaries Russet „ Olive „
Nearly neutrals, slight predominance of either red, yellow, or blue ..	Brown Tertiaries Cold grey „ Warm grey „

We have now in our hands in a brief form what may be called the anatomy of colour. It is, of course, the barest outline, but I believe it will be found to include the fundamental propositions needed for comprehending the mechanism of the inter-relations of colour tone.

I propose to set down next in order a series of

Tone Combinations

to illustrate the foregoing remarks.

We may then at this stage regard ourselves as in possession of a number of tones which may be arranged in a great variety of ways.

These characteristic tones are easily recognisable.

	PRIMARIES.	
Red.	Blue.	Yellow.
	SECONDARIES.	
Oranges.	Greens.	Purples.
	TERTIARIES	

Red tertiaries, Blue tertiaries, Yellow tertiaries, Orange tertiaries, Green tertiaries, Purple tertiaries, Citron tertiaries, Russet tertiaries, Olive tertiaries, Brown tertiaries, Cool Grey tertiaries, Warm Grey tertiaries.

Every one of these tones is capable of an infinity of modification in shade, still retaining the characteristic of its tone.

It is indifferent which selection of the significant classes of tones be taken for experiment. Every member of them may be used in combination with any or every other one, so long as the great harmonic law be kept in view that *any two neighbouring tones, or tones so near as to affect one another, must contain the complete chord of red, yellow and blue, either singly or in combination*, and that one of these tones must be a full tertiary.

We may place as brilliant and pure a red as the palette affords against a green, yellow or blue, if either of these latter contrasting tones be harmonised by the infusion of the other tones of the chord. To retain a brilliant red contrasted with blue, the blue must be infused with both red and yellow, the red to establish a latent sympathy and the yellow to complete the chord.

1. Yellow dominant combined with violet and olive green.
2. Green „ „ „ orange and brown.
3. Russet „ „ „ citron and cool grey.
4. Blue „ „ „ green and olive.
5. Red „ „ „ violet and brown.
6. Violet „ „ „ citron and yellow.

By increasing the proportions of the partials each successive scheme becomes softer and more subdued in effect, gliding imperceptibly into delicate neutrals. Some most delightful effects may be obtained inside the scales of the neutral tertiaries. For instance, a harmony in brown may be introduced, running through the most delicious golden and chestnut tones to a cool and exquisite neutral.

It is obvious that each tone in the table of tertiaries is in itself a complete harmony. The juxtaposition of such hues can never be inharmonic, and there is in the multitude of possible combinations scope for what we may, without any straining of the sense, call emotionally expressive colour. Though in decorative schemes discords can be and are purposely introduced, they are so only to serve the purpose of enhancing the beauty of the complete chords, or to impart a character to the composition by departures from the normal canon; to add interest and emotional force, if such an expression may be allowed. The æsthetic laws that rule the world of graphic and musical art have their exact analogies in the equal sphere of colour which completes the celestial triad.

It remains to offer some practical suggestions on the selection and mixture of those pigments which will be found most useful in decorative art. The pigments may be conveniently arranged

in the form of a chart or schedule, and will conclude the brief series of notes which the space at our disposal allows us to offer.

In the Mixing of Colours

it is recommended that every effort should be made to get the tint required with the fewest colours. As a rule, paint so prepared is more permanent, and the tints have better quality of tone.

A little consideration will effect a great deal in this direction by using brilliant primary tones in conjunction with the neutrals. As an instance, a wide range of subdued rich greens may be made by the simple addition of the chromes to black. Blues of great brilliance and richness may be elicited from ultramarine by the addition of a slight trace of lemon chrome. Working on the same principle, very intense and rich reds will be found in the mixture of the tertiary reds with madder or crimson lake.

Prussian blue should be avoided. It is a colour that the decorator will exclude from the larger range of his tones. Though in the very dark greenish blues and deep blackish neutrals it is a valuable colour, its use should be limited to these tones.

SCHEDULE OF PIGMENTS.

Reds.—*Vermilion.*— Opaque, brilliant red, not good for mixing with other colours unless the final tone is required to be distinctly red. An indispensable colour. *Light Red.*—Semi-transparent, good for qualifying other colours when subdued tertiaries are wanted, as it contains an excess of yellow. *Venetian Red.*—Similar in quality to the above, except that the yellow partial is not so strong. *Indian Red.*—Very powerful colour; must be used with great care in mixtures. It contains blue in excess, and is apt to impart a livid effect to any combination of which it forms part, owing to the strong staining power and defect of yellow in its composition. *Crimson Lake.*—Transparent, brilliant red, with a strong infusion of blue; useful in compounding reds and purples; should not be used for the more delicate tertiaries.

Blues.—*Prussian Blue.*—Brilliant, transparent blue, strong yellow partial, no red; a very powerful colour, but not to be widely used. It destroys the delicacy in mixtures, and ought rarely to occur in tertiary tones. *French Blue.*—Rich, deep blue, with a very just balance of partials; the most useful blue for decorative purposes. *Indigo.*—A very deep, transparent blue, with a large admixture of partials, yellow being in excess of red; not, much used in decorative work on a large scale but an exceedingly useful colour.

Yellows.—*Chrome, Pale and Middle.*—A strong opaque yellow with blue partial; its best uses will be found in combination with the neutrals; its opacity, its secondary quality, and its power render it unsuitable for delicate tones, except in the case mentioned in the text. In combination with black or brown it then gives an exceedingly good range of tones. *Yellow Ochre.*—Transparent yellow with a very just balance of partials; very suitable for the compounding of tints; one of the best yellows on the palette. *Roman Ochre.*—Similar to the above, but more neutral in tone. *Raw Sienna.*—A good transparent yellow, with a strong infusion of partials; good for nearly all purposes. *Lemon Yellow.*—Very opaque yellow, best in combination with the neutral browns and greys.

Oranges.—*Orange Chrome.*—Strong opaque orange, not good for combination with delicate colours; affords brilliant but good tone with strong transparent colours and with the neutrals. *Burnt Sienna.*—Transparent neutral orange; a very useful colour in all combinations. *Burnt Roman Ochre.*—Not so transparent as the above, but a most useful pigment in nearly all cases.

Greens.—*Emerald Green.*—Bright opaque green, rarely used; it combines very badly with other pigments, but is useful to the production of very brilliant green blues. *Terra Vert.*—Neutral green, semi-transparent, very useful in the production of tertiary tones.

Browns.—*Burnt Umber.*—Rich warm brown, useful in strong tones, but apt to become livid. *Raw Umber.*—Soft, delicate, neutral yellowish-brown; one of the most useful pigments on the palette. *Vandyke Brown.*—Purplish brown, transparent, very powerful and generally useful colour, but apt to get livid if used in excess in mixtures.

Blacks.—*Ivory Black.*—Transparent, nearly neutral. *Lamp Black.*—Opaque, nearly neutral.

At this point it will be well to consider two characteristic differences between the two great classes of hues. Firstly, it will be found that the secondaries are deficient in richness and harmonisable quality, due, of course, to the absence of the third complementary partial in their composition. In the next place, as stated above, a secondary is always of its own original class, and never passes into either of the others, in contradistinction to the tertiary hues, which range through every one of the infinite gradations of tone and change, from primary to primary.

(To be continued.)

Professional Practice.

Aberdeen.—The Albert Hall, Huntley Street, Aberdeen, has just been decorated. Mr. William Philip, painter and decorator, 76 Huntley Street, has been engaged on the work for more than two months, and the panels at the west end of the hall have been painted by Mr. Adam Tyler, Schoolhill, Aberdeen. The walls have been treated in a rich, deep crimson tone subdued with dark fleur-de-lys ornaments at intervals of about a foot apart. The ceiling is kept light in tone, with a view of giving a feeling of space and freshness, the tone being a silver grey, with the mouldings picked out in several complementary colours to harmonise with the panels, which have been richly decorated with conventionalised floral ornaments. In a series of cartouches are the names of the poets Scott, Keats, Tennyson, Rosetti, Shelley, Wordsworth, Coleridge and Burns. Mr. Tyler's three panels at the west end of the hall are enclosed in three spaces, separated by painted pillars to harmonise with the pillars round the sides of the hall. The central panel—12ft. by 9ft.—is representative of Music. The other panels represent Art and Poetry. Round the central panels there is a decorative border formed of the branches of trees. All the woodwork of the hall has been grained and varnished. Mr. Philip's design was accepted by the directors of the hall from several competitive designs.

Glasgow.—A company has been formed to acquire a block of buildings in the centre of Glasgow, in Argyle Street, for the purpose of being remodelled and converted into the home of the Glasgow Central Stores, Limited. The site of the new stores is bounded by Argyle Street on the north, Dunlop Street on the east, Turner's Court, &c., on the west, and the new street opposite St. Enoch Station on the south. It is intended to entirely rebuild the property, except a small section facing Dunlop Street, which was rebuilt not many years ago, and which only requires remodelling. It is proposed to utilise the first floor facing Argyle Street for the purposes of luncheon and tea rooms, which will be accessible from the stores, and also have a separate entrance for the general public from Argyle Street. There will also be a hotel in the premises. The site has a frontage to Argyle Street of 179ft., to Dunlop Street of 115ft., to Turner's Court, &c., of 122ft., and to the street between the company's building and St. Enoch Station of 142ft. There will be six floors, including basement and attics. Plans for the rebuilding of the property have been

MODEL OF THE NEW TOWN HALL AT LYNTON. READ AND MACDONALD, ARCHITECTS.

prepared by Messrs. Ernest Runtz and Company, architects and surveyors, London. The cost is estimated at—

Cost of property as it stands	£160,000
Cost of rebuilding	50,000
Fitting up premises	10,000

Liverpool.—In a few weeks the red brick building known as the Gordon Smith Institute, opposite the Sailors' Home, at the corner of Paradise Street and Hanover Street, will be formally opened. The institute is the gift of Mr. Samuel Smith, M.P., to the Liverpool Seamen's Friend Society, of which the hon. gentleman is president, and has been erected at a cost of £20,000. The building is in the Elizabethan style, and is to serve as a centre for the work both of the Seamen's Friend Society and the Strangers' Rest. The portion of the building nearest to the Sailors' Home will contain, on the ground floor, a spacious and well-appointed general reading-room for sailors and firemen; and on the first floor a reading-room, comfortably furnished, for officers and engineers. To the latter will be annexed a room in which shipmasters can transact business or meet people by appointment. The roof of this wing of the building will be flat, and laid out as a summer garden, commanding a view of several busy thoroughfares. The opposite end of the building will be used by the Strangers' Rest, with a comfortable and well-lighted reading-room and rooms above for the various social agencies carried on in connection with the society. In the centre of the Institute accommodation is provided for the Seamen's Friend Society's staff, including a library, superintendent's room, and offices. The chief feature of this part of the building, however, is on the ground floor—a hall, lighted from both ends, capable of seating 400 persons. This is to be used for meetings and entertainments. The western end, where the platform is placed, is a large bay. On the first floor is a somewhat smaller hall for the use of the Strangers' Rest, together with various class-rooms. The architects are Messrs. Walker and Strong.

Shere, Surrey.—The Hall and Institute illustrated on the previous page were designed by Mr. Felix Clay, architect, of 19 Buckingham Street, Strand, W.C., and shows how pleasing a result can be obtained by simple means. The hall, 64ft. by 26ft. 6in., is approached from a vestibule, having on the left a reading room 17ft. by 20ft., and another apartment on the right the same size. The hall has a stage at its upper end, with a retiring room 16ft. by 14ft.

Sparkhill, Birmingham.—The Yardley School Board have erected new schools in College Road, Sparkhill, and these were opened last week. There are commodious and well-lighted rooms for boys, girls and infants, and a cookery centre. Accommodation has been provided for 360 boys, 360 girls and 410 infants, and the cost of the work is estimated at between £13,000 and £14,000. The schools have been erected by Messrs. Harley and Sons, of Smethwick, from plans prepared by Mr. R. F. Matthews, architect, Birmingham, and are of red brick with buff terra-cotta ornamentations. The buildings are divided into three main halls, one in each department, five class rooms each having been provided in the girls' and boys' sections, with provision for two additional ones in each department in future, and six class rooms, each to accommodate sixty, in the infants' portion of the schools. The flooring, with the exception of the corridors, is composed of wood blocks, the latter, alike with the playgrounds, being of asphalt. The provision for warming the buildings is Haden's low-pressure system, and the natural ventilation principle has been selected. A caretaker's house has also been erected.

Lynton Town Hall.—The model of this building (which has recently been completed from the designs of Messrs. Read and Macdonald, A.R.I.B.A., architects, of London, W.) was made by Mr. W. Furneaux with great care and ability. Full particulars of the building will be found on page 59 of our issue for August 22nd last.

MODEL OF THE NEW TOWN HALL AT LYNTON. READ AND MACDONALD, ARCHITECTS.

New Patents.

These patents are open to opposition until October 9th.

1899.—Door Handles.—15 331, A. JONES, Warwick House, Bangor, N. Wales. The handle is made in two parts, one fitting within the other. When squeezed, a lever lifts the latch on the inside of the door, allowing it to be opened.

Acetylene Gas Generators.—17,243. G. KELLAWAY, Hotel Road, St. Austell, Cornwall. This generator has two carbide holders, either of which can be charged while gas is being consumed at the burners, and one water and gas holder. The apparatus automatically feeds itself with water from the main, and it is claimed that there is no waste, owing to the interior having no communication with the atmosphere.

Waste Fittings.—18,698. T. W. ROGERS, 27 and 28 The Triangle, Bournemouth. The mouth of the waste pipe is tapered outwards and the holes in the grating that fits in it are equal to, or exceed, the area of the pipe, so that there is a good flush. The grating is fitted with a metal disc having a rubber face on the under side: this disc acts as a plug and carries a pin that fits in the grating.

Lightning Conductors.—19,678. K. W. HEDGES, 1 Emery Hill Street, Westminster, S.W. One feature of this invention is the method of joining conductors together at junctions. The tinned copper wires are enclosed in a mould, into which lead or some fusible metal is poured, binding all together. The invention also includes a means for making good earth connections.

Blocks for Lining Sewers, &c.—19,722. D. T. CLEGG, 44 Tonman Street, Manchester, and H. N. BROOKE, Fieldhouse Works, Huddersfield. Each block (preferably made of vitrified or other stoneware) has a spigot at one end fitting into the corresponding hollow in the adjoining brick, so forming a key and keeping the proper alignment. Dovetail grooves are also provided, thus locking the blocks longitudinally and radially. It is claimed that one course of these blocks is equal to two or three courses of bricks, besides which labour is saved in laying them.

Prism Plates for Windows.—22,496. BRITISH LUXFER PRISM SYNDICATE, LIMITED, 16 Hill Street, Finsbury, E.C. (communicated by O. H. Basquin, Berlin). The glass plate has on one side a series of prisms, the two base angles of each being 50 degs. and 70 degs. This means that when the plate is fixed vertically one or other of the angles of each prism will refract the light.

1900.—Enamels.—10,039. G. APPIANI, Trevise, Italy. The following are the constituents of a whitish enamel containing no tin:—Calcined sand, 19 parts; minium or litharge, 13 parts; kaolin, 28 parts; common salt, 4 parts; soda, potash or other alkalies, 3 parts; quartz or calcined marble, 23 parts.

The following specifications were published on Saturday last, and are open to opposition until October 15th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—12,656, WORRALL, fences and gates. 13,764, WILLIAMS AND PAYNE, sliding window sashes. 13,765, WILLIAMS AND PAYNE, window casements. 16,265, DARGUE, generation of acetylene gas. 16,287, VAN PRAAG AND HARKER, acetylene generators. 16,411, HUNTER AND MITCHELL, appliance for cutting Z, T, and other bars to any bevel. 16,607, SMITH, spring roller blinds. 19,013, WHITELOW (*Kestner*), means for humidifying the air of rooms. 19,020, WILBY, electric arc lamps. 19,204, RENOUF, joints for tubing. 19,275, SORENSEN, apparatus for generating acetylene gas. 19,358, LE MESURIER, street and other paving made of moss litter. 19,881, DAVIS, roughened or grip surfaces of glass. 20,048, ROGERS, apparatus for the manufacture of acetylene gas. 20,061, BLAIR, BLAIR AND BAILLIE, fluid-pressure joints on doors, pipes, &c. 20,145, SEVENOAKES' combination electric light fittings. 20,271, ROBINSON, apparatus for making earthenware sinks. 20,318, STAFFORD, ratchet drills. 20,349, HALL AND AXTEN, draught excluders for doors. 20,428, BROOKE, fittings for heating apparatus. 20,435, BRINDLEY AND ROWLEY, machinery used in the manufacture of tiles and bricks. 20,447, BEARDS, means of attachment between cap or back plates and sheet metal lock and latch cases. 20,641, MACKEAN, incandescent gas burners. 24,218, LAKE (*Freeman*), smoke preventing and consuming devices for steam boilers.

1900.—4,082, BROWN, hoisting and conveying apparatus. 4,495, NESBITT, wall and ceiling decoration. 6,234, THOMPSON (*McCullum, Blakney and Bartlett*), water-supply and heating apparatus. 7,754, BULLOCK, gas pressure reducing and regulating apparatus. 9,030, WYNN, PERKINS AND GIRDWOOD, smoke-preventing apparatus for steam boilers. 9,837, WADSWORTH, machine for cleaning files or rasps. 10,226, SAVAGE, SAVAGE AND WEST, apparatus for closing and securing doors. 10,955, STEVENS, imitation wood and process of making it. 10,994, HADDAN (*Adams and Westlake Company*), acetylene gas generators. 11,369, DELIN, burners for incandescent gas lighting. 12,169, BLUTHNER, apparatus for smoothing or polishing wood. 12,251, JANDUS, filters. 12,252, JANDUS, filters and fittings for them. 12,317, TACHARD, jointless flooring. 12,446, ALBRECHT, brick for ceilings.

Masters and Men.

The Cheltenham Building Trade Dispute has been settled, the arbitrator, Mr. O. J. Williams, Registrar of the County Court, having just made his award. At the end of October last the Amalgamated Society of Gas Workers, Brickmakers, and General Labourers, gave notice to the Master Builders' Association for an advance of 1d. per hour in the wages of builders' labourers, so as to raise the wages from 5d. an hour, as paid at present, to 6d. Thereupon the Masters' Association gave a counter notice for a reduction of the wages to 4½d. an hour, and as the men refused to recognise this counter notice a deadlock ensued, and at the expiration of the original notice the labourers came out on strike, their demand not having been complied with. After the strike had lasted six weeks, the Mayor (Alderman Norman) successfully intervened and smoothed the way for arbitration both on the notice and on the counter notice. The Magistrates' clerk, at the Mayor's request, having been selected to determine the question of the validity of the counter notice, and he having decided that point against the men, the arbitration was conducted, when Mr. R. R. Skemp appeared to represent the employers and the men's case was advocated by Mr. J. W. Betteridge, secretary to the Amalgamated Society. The arbitrator, after taking time to consider the arguments and statements placed before him, has now decided that the standard rate of wages for builders' labourers in the town shall remain as at present, 5d. an hour, and he has further adjudged that the expenses of arbitration and award shall be borne in equal shares by the parties thereto.

Building Trade Disputes at St. Helens.—After having existed for a period of fifteen months the strike of the St. Helens bricklayers has now come to an end, the matters in dispute between them and the masters having been satisfactorily arranged, and it is anticipated that the arrangement arrived at will be such as will obviate a similar difficulty for a considerable time to come. In November, 1898, the bricklayers served notices upon the secretary of the Master Builders' Association that they desired an alteration in the working rules. This embraced an alteration in the existing rate of pay, which was then 9d. per hour, the men applying for an advance of a halfpenny, the limitation of apprentices, and several minor matters in reference to which some little friction existed. The usual negotiations took place some time before the expiry of the notice in May, but no satisfactory arrangement could be arrived at, the masters not feeling that the men were justified in applying for the advance asked for. At the end of May last year the men came out, virtually on strike, though we are informed that they had actually given the one day's notice required in the trade to terminate engagements. Practically the whole of the men obtained employment in other districts, and in many cases the masters had to rely upon their apprentices to carry on their work for them. In June last, after the strike had been in progress twelve months, the men withdrew their demand for the advance of a halfpenny per hour, and it was hoped other matters about which there was any difference would be speedily settled. Indeed, an announcement was made that the strike was actually at an end. This did not prove to be the case, however, the stumbling-block being the limitation of apprentices. The rule as it existed was that there should not be more than one apprentice to every three men and not more than six in a firm, and the men desired that the number of apprentices to be employed should be further limited. The masters agreed to an alteration of the rules that there should not be more than five apprentices in a firm, and to this the men assented, thus bringing the strike to an end.—There is no alteration in the position so far as the joiners' lock-out is concerned. We understand that the masters' attitude is that the rules provide that six months' notice shall be given for a change of working rules, and that the men have broken this rule in their action with respect to the "foreign" finished joinery. Nevertheless, they are content to accept the notice as if it had been made according to rule, and consider the matter in November next, together with the men's demand for a halfpenny an hour advance in their wages, for which they have asked. The contention of the masters is that the foreign finished joinery is not made by joiners, but by trained machine men, who are paid by piece-work, a condition that does not prevail with ordinary joiners, and hence that the stipulation as to trades union rates of wages does not apply. However, there the matter rests at present, and it is not easy to foresee what the ultimate outcome will be.

Engineering Notes.

Tramway Extensions at Liverpool.—On Saturday a new line serving the residential country districts of Seaforth, Waterloo, Crosby, and Blundellsands was opened for traffic. The new line, which is between two and three miles in length, has been provided by the Liverpool Overhead Railway Company.

New Railway Station at Newmarket.—During the hearing of an application for a new hotel near the railway at Newmarket Brewster Sessions last week, it was stated that the Great Eastern Railway had purchased from Colonel Harry McCalmont land nearer the racecourse than the present station, on which to build a new railway station estimated to cost £55,000.

Slot Electricity Meters for Battersea.—Battersea householders will shortly have electric light in their homes by the penny-in-the-slot system. The generating station is being rapidly built, and the parish will in a very short space of time be supplied. The roads in the district are being opened to lay down the wires, and it will be the first parish in London in which electric light will be installed with the slot.

Strengthening Southwark Bridge.—The process of strengthening the foundations of the northern pier of the central arch of Southwark Bridge is now complete and the structure made as secure as ever before. The operation, which consisted of throwing in vast quantities of stones and sand, was necessitated by the strong scour of the tide having washed away some of the earth in which the pier is set.

Electric Trams in the Lake Country.—A scheme is on foot to introduce electric trams with overhead trolleys into the English Lake District, under the Light Railways Act. It is being promoted by a London company, in con-

junction with the Windermere and District Electric Supply Company, but a large proportion of the residents think the scheme is a most undesirable one. They say that it would spoil the main roads between Windermere and Bowness, and also between Windermere and Ambleside for driving, cyclists, and pedestrians. An improved service of omnibuses or motor cars would meet all requirements, as the resident population is small, and it is only in the summer months that there is any demand for additional modes of locomotion.

Builders' Notes.

The Glenboig Union Fire Clay Company, Ltd., have been awarded a gold medal for their exhibits of fire-clay goods at the Paris Exhibition, 1900.

The Results of the May Examination in Building Construction by the Science and Art Department show that 50 per cent. of the candidates in Honours from the City of London College succeeded in passing, as against 55½ per cent. last year.

Building Operations in Norwich, in spite of the bricklayers' strike, seem to be progressing. Messrs. Caley's huge factory in St. Stephen's Back Street is a prominent feature in the view from the Castle Hill. Messrs. Chamberlin have erected a warehouse in Dove Street. Close by, on the other side of the street, other buildings have been put up. The new Arcade Stores, at the Back-of-the-Inns, has effected a much-needed public improvement. The new Norfolk and Norwich Savings Bank at Orford Place is now fairly well advanced.

Veneers as Wall Decorations.—At the auction sale of Messrs. Edward Chaloner and Co., at Liverpool, two logs of African mahogany were recently sold for £1,536. They formed one tree, and were bought for the purpose of being cut into veneers for the decoration of the palatial residences of some of the merchant princes of the United States of America. The veneers are used in the place of wall-papers. The prices realised for the two logs were respectively 10s. 3d. and 7s. 3d. per superficial foot, which is a record for African mahogany logs in the rough state, as imported.

A German Cement Combine.—The unsatisfactory condition of the German cement industry has induced the representatives of the various works to consider the question of forming a general syndicate for the whole of Germany. The works associated with the existing cement union estimate their production for the current year at 6,400,000 tons of cement and the consumption at only 4,100,000 tons. The anticipated over-production will, however, be increased by the output of the new cement works, which is calculated at 2,610,000 tons for the year. In these circumstances it is proposed to form a general syndicate both for the home trade and the export branch. It is intended to limit the production of the works belonging to the union to the average quantity sold during the past three years, with the addition of 60 per cent. of the possible greater output due to recent improvements in working, whilst the production of the new works is suggested at 60 per cent. of their full capacity. As the latter object to this restriction, further negotiations are pending with a view to the constitution of the proposed general syndicate.

Workmen's Dwellings for Liverpool.—The Deputy City Surveyor of Liverpool, Mr. F. T. Turton, has been directed by the Insanitary Property and Artisans' Dwellings Committee of the Corporation "to obtain from the Tramways Committee full information as to the land and buildings in the possession of that committee which will not be required after the completion of the change from horse to electric traction, and to report whether any and which sites could be utilised by this committee for the erection of labourers' dwellings, having regard to the limit of distance prescribed by the Local Government Board." Another resolution is in the following terms:—"That with the view of ascertaining whether the tenants of the various dwellings under the control of this committee are residing near to the places where they usually work, the deputy surveyor obtain through the superintendent and the deputy superintendent information on the subject from the respective tenants, and afterwards tabulate the same, and have the distances calculated, and then report the result to this committee."

Brick-Making in India.—A correspondent of "Indian Engineering" states that the best work on brick-making in India is the Section on Building Materials in Vol. I. Roorkee C. E. College Series. The expense incurred in making machine-made bricks is not commensurate with the advantages obtained; manual labour is so cheap, easily obtained in India, that the use of machinery does not pay. Bricks made of well pugged clay, table moulded and burnt in a kiln, are good enough for any brick-masonry work in India, the great drawback of machinery being its immobility. As a rule, in India bricks are manufactured at or very close to the site of the work on which they are to be utilised. In case machinery were made use of, a central brickfield would have to be established and the manufactured bricks carried to site of work; this carriage would then add materially to the cost of the bricks. The great difficulty generally experienced with hand-made bricks is to get the arises or edges sharp and well defined, and the only way to obtain this is to have the moulds well made in the first instance and very carefully watched while in use; any mould found to be in the slightest degree cracked or damaged should be at once rejected.

The Teak Trade of Northern Siam.—From the report of Mr. Black, British Consul at Chiang-mai, or Zimme, in Northern Siam, for the past year, it appears that trade with Burma was less than in the previous year, owing to smaller deliveries of teak from the Siamese Salween districts to Moulmein. Last year these amounted to 17 824 cubic tons, valued at £79,314, against 26,479 cubic tons, valued at £100,657, delivered at the registration station of Kado, on the Salween. On the Siam side the amount of teak floated down to Bangkok was 25,326 cubic tons, valued at £96,250, being slightly less than in the previous year. Thus the total value of the teak exported from Northern Siam last year was £175 584. The decrease last year was not at all due to decline in the production in the forests, but to a deficiency in the rainfall, which prevented the streams and rivers by which the timber is floated down from rising sufficiently to carry it away, so that no timber was floated out to the main stream from many of the tributaries. Hence, if the rains this year prove heavy, the arrivals of teak will exceed those of any previous season. The cost of getting the teak out grows more and more expensive on account of the scarcity of labour. The British capital invested in the teak industry in Siam is two millions sterling.

New Companies.

George Priest's Pottery and Stoneware Manufacturing Company (Cardiff), Limited.

This company was registered on August 21st with a capital of £14,000 in £1 shares to acquire the business carried on at Wyndham Crescent, Canton, Cardiff, by G. Priest, and to carry on the business of brick, tile, pipe, pottery, earthenware, china and ceramic ware manufacturers, &c. The first directors (to number not less than three nor more than seven) are H. Knill, W. Mathias, A. E. Glaves and G. Priest.

Anglo-Roumanian Company, Limited.

This company was registered on August 21st with a capital of £32,000 in £1 shares to carry on in Servia and Roumania or elsewhere the business of window glass, table glass, mirror, bottle, glass and china ware, box, barrel, cask, and case manufacturers and merchants, ironmongers, &c. The first directors (to number not less than three nor more than seven) are W. Bailey, W. A. Bailey, R. B. Fraser, H. S. Pratt and Isodore E. Ellenbogen.

New Malden Development Syndicate, Limited.

This company was registered on August 21st with a capital of £2,000 in £1 shares to acquire land at New Malden or elsewhere and to carry on the business of land and property owners, builders, contractors, agents, surveyors, &c.

Hygienic Sanitation, Limited.

This company was registered on August 24th with a capital of £10,000 in £1 shares to acquire the business of sanitary and general engineers and contractors. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers.

Aberdare Electric Lighting Company, Limited.

This company was registered on August 23rd with a capital of £2,000 in £1 shares to carry on the business of an electric light company in all its branches. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers.

Finchley Electric Light Company, Limited.

This company was registered on August 22nd with a capital of £3,000 in £1 shares to carry on at Finchley or elsewhere the business of an electric light company in all its branches. The first directors are to number not more than five. M. W. Woods is a permanent director.

Twentieth Century Land Syndicate, Limited.

This company was registered on August 21st with a capital of £2,000 in £100 shares to carry on the business of landowners, builders, contractors, financiers, &c. The first directors are H. L. Diprose, W. J. Hubbard, C. H. Mason, R. Morris and W. H. Stilgoe. Registered office: 20 Essex Street, W.C.

Port Talbot Iron and Steel Company, Limited.

This company was registered on August 21st with a capital of £10,000 in £50 shares to acquire mines, quarries and collieries, and to carry on the business of iron and coal masters, iron and steel manufacturers, ironfounders, &c. The first directors (to number not less than three nor more than five) are to be appointed by the subscribers.

Phelps's Metal, Limited.

This company was registered on August 22nd with a capital of £10,000 in 10s. shares to acquire the business of a company of the same name and to carry on the business of iron-founders, ironmasters, steelmakers, smelters, grinders, engineers, tinplate makers, builders, &c. The first directors (to number not more than five) are to be appointed by the subscribers. Registered office: Suffolk House, Laurence Pountney Lane, E.C.

Hudson and Company, Limited.

This company was registered on August 22nd with a capital of £20,000 in £1 shares to acquire and carry on the business of timber and mahogany merchants, sawmill proprietors, cabinet and general wood turners, sawyers, &c., carried on by J. H. Howarth and C. A. Walker at 13, 15 and 17 Garden Street, Leeds, as Hudson and Co. The first directors (to number not less than two nor more than five) are J. H. Howarth and C. A. Walker, each of whom may retain office for life. Registered office: 17 Garden Street, Marsh Lane, Leeds.

Kandalax Wood Company, Limited.

This company was registered on August 2nd with a capital of £100,000 in £1 shares, of which 80,000 are preference shares, to acquire the Actiebolaget Kuusamo and to carry on in all or any of their respective branches the businesses of planters, forest owners, sawyers, timber merchants, sawmill proprietors, shippers, joiners, carpenters, builders, millowners, &c., and any other businesses connected with the same. The first directors (of whom there shall be not less than three nor more than seven) are C. A. Stewart, V. Olsson, F. R. Cheeswright, W. Olsson and W. R. Lenanton.

Bishop, Pratt and Company, Limited.

This company was registered on August 24th with a capital of £15,000 in £1 shares (4 000 preference) to acquire the business carried on at 7 Wormwood Street, E.C., as Bishop, Pratt and Company, and to carry on the business of builders' merchants in all its branches. The first directors (to number not less than three nor more than five) are J. R. E. Pratt, E. F. Bishop and G. B. Corbett.

H. L. Dean and Company, Limited.

This company was registered on August 24th with a capital of £2,000 in £1 shares to acquire the business carried on by H. L. Dean, trading as H. L. Dean and Company, at Longton, Staffordshire, and elsewhere, and to carry on the business of iron merchants, machinery brokers, ironfounders, engineers, brickmakers, dealers in building materials, &c. The first directors (to number not less than two nor more than five) are G. Dean and H. L. Dean.

Smith's Dock Trust Company, Limited.

This company was registered on August 11th with a capital of £100 000 in 50,000 £1 ordinary shares and 5,000 £10 preference shares to build, construct or acquire any dry docks, slipways, pontoons, floating docks, gridirons and other works and conveniences, to deal with the same in such manner as the company shall deem expedient; as mechanical, general and electrical engineers, brass and iron founders machine-tool makers, smiths, ironmongers' furnishers; as millwrights, iron and steel converters, woodworkers, builders and contractors, painters and decorators, metallurgists, water-supply engineers, art metal workers, upholsterers, general house furnishers, &c. The first directors (of whom there shall be not less than three nor more than seven) are E. Smith, H. Eeles, C. O. Hall, L E. Smith and G. S. F. Edwards.

Driver and Company, Limited.

This company was registered on August 15th with a capital of £50,000 in £1 shares to adopt and carry into effect an agreement made between G. Y. Mercer and T. J. Wall and this company for the acquisition of the business of timber merchants, &c., carried on under the style or firm of Driver and Co. at Southampton, to carry on in all or any of their respective branches the businesses of slate and cement importers and merchants, veneer cutters, sawmill proprietors, cabinet makers, wood turners, moulding manufacturers, lath renders, manufacturers of wood railway keys and sleepers, wood pulp manufacturers and merchants, carpenters, wheelwrights, manufacturers of and dealers in wooden articles of every description, builders' merchants; as brick, tile and terra-cotta manufacturers; to establish and maintain creosoting works, &c. The first directors (of whom there shall be not less than two nor more than five) are G. Y. Mercer and T. J. Wall.

Town and General Estates, Limited.

This company was registered on August 16th with a capital of £50,000 in 49,950 £1 preference shares and 1,000 1s. deferred shares for the acquisition of certain lands and other property; and, further, to construct, maintain, improve, develop, work, control and manage any waterworks, gasworks, reservoirs, roads, tramways, electrical works for the supply of power, heat or light, telephones and telephonic works and apparatus, hotels, clubs, furnished or unfurnished flats, restaurants, baths, &c.; as builders and contractors, decorators, general merchants, and dealers in stone, sand, lime, bricks, timber, hardware and other building requisites; as brick, tile and terra-cotta manufacturers, &c.; to lay out land for building purposes and to develop it. The first directors (of whom there shall be not less than three nor more than five) are to be elected by the signatories to the memorandum of association: R. G. Theyne, P. H. Hetherington, J. H. McCashin, H. H. Hull, F. W. Allen, G. Barrett, and E. Mayer. Managing director, F. M. Armstrong. Registered office: 11 Cornhill, E.C.

Phos Acetylene Gas Company, Limited.

This company was registered on August 24th with a capital of £7,500 in £1 shares to adopt an agreement with F. W. Harker and D. J. Van Praag for the acquisition of certain patents, and to carry on the business of manufacturers and suppliers of acetylene gas. The first directors (to number not less than three nor more than five) are E. S. Sawyer, F. W. Harker and D. J. Van Praag; the last two named are managing directors. Registered office: 59 60, Chancery Lane, W.C.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

CLEETHORPES.—For the erection of electric-power station, chimney shaft, car sheds, workshops, &c., in Pelham Road, for the Great Grimsby Tramways Company. Mr. John Glenn, C.E., architect. Mr. J. Fereday Glenn, surveyor, 11 Queen Victoria Street, London, and 346 Cleethorpes Road, Grimsby:—

	Power station.	Depot.	Total.
Thompson & Sons	£7,987	£6,059	£14,046
Frere & Co.	7,809	5,845	13,645
Hewins & Goodhand	7,500	5,440	12,940
H. Marrow	6,522	4,951	11,473
Wilkinson & Houghton, Grimsby*	6,310	5,003	11,313

* Accepted.

CLUTTON, SOMERSET.—Accepted for the erection of a further six cottages on the Greyfield Estate, for the Earl of Warwick, Mr. W. F. Bird, architect, Midsomer Norton:—

T. Keeling, Timsbury ... £840

CLUTTON, SOMERSET.—Accepted for the construction of a water storage reservoir and the laying of cast-iron distributing mains, fixing hydrants, &c., for 46 cottages on the Greyfield Estate, for the Earl of Warwick. Mr. W. F. Bird, Civil Engineer, Midsomer Norton:—

T. Keeling, Timsbury ... £638

CLUTTON, SOMERSET.—Accepted for the laying of a main sewer and the construction of a scum tank and bacteria filters, for 46 cottages on the Greyfield Estate, for the Earl of Warwick. Mr. W. F. Bird, Civil Engineer, Midsomer Norton:—

T. Keeling, Timsbury ... £466

HENDON.—For private street works and bacteria filter, for the Urban District Council of Hendon. Mr. S. Slater Grimley, engineer and surveyor:—

Colin Deep Lane Works.

Thos. Adams	£3,883 0 0	Nowell & Co.	£3,121 11 0
Neave & Son	3,448 0 0	R. Ballard, Ltd., Child's Hill*	2,895 0 0
Mowlem & Co.	3,689 0 0		

Sewage Outfall Works, Bacterial Filter No. 3 (Labour only).

Thos. Adams	£715 5 6	R. Ballard, Ltd., Child's Hill*	£563 0 0
Neave & Son	573 0 0		

[Council find all materials.] * Accepted.

INVERKIP, N.B.—For the construction of a storage reservoir, &c., for the District Committee. Mr. James Murray, C.E., County Buildings, Paisley:—

W. G. Flett	£1,809 12 0	Peter Bow	1,509 9 11
Hugh Hastie	1,166 1 0	Cunningham & Sons, Kilmalcolm*	1,140 17 6
James Keanie†	915 2 6		

* Accepted. † Too late.

LICHFIELD.—For additions to workhouse, Trent Valley Road, for the Guardians of the Poor of the Lichfield Union. Mr. W. H. Woodroffe, architect, 214 Great Dover Street, London, S.E.:—

The Monument to Nelson's Hardy, on the summit of Blagdon Hill, in Dorset, one of the most commanding landmarks on the south coast, has been restored from the public funds collected for that purpose. The tower had fallen into a dangerous state of dilapidation, and an appeal was made to place it in a proper state of repair before handing it over to the National Trust for the Preservation of Places of Historic Interest. As an evidence of the extent of the repairs necessary it may be said that more than fifty tons of Portland stone were utilised, all of which had to be hauled by traction engines to the summit. The tower is now in a perfect state of repair, and with a little attention will survive many generations.

An Architectural Causerie.

South Africa after the War: Architectural Prospects.

It is probable that every man in England who is dissatisfied with his progress and his prospects (and who is not?) has had the idea pass through his mind during recent times that he might do well to "keep his eye on South Africa." So deeply and widely has the mind of the British people been stirred by the events of the past year that it is inevitable that a degree of emigration fever should be found to exist, and that, it is to be feared, rather out of proportion to the degree to which circumstances warrant emigration. The writer does not pretend to such a knowledge of political economy as to offer an authoritative opinion on the question, but it seems a reasonable proposition that the venture of emigration may be found to be governed by similar laws to those which apply to other human speculations. Now, it is a common maxim for most speculations that you should buy when people are selling and sell when people are buying. Might it also be said that you should emigrate when people are not emigrating—and conversely? If there be anything in that, there is a good reason why anyone should *not* go to South Africa in the near future. Hundreds of all classes of the community have made up their minds to go, and hundreds who have already gone as volunteers and reservists have made up their minds, if possible, to stay. That there is a very considerable number of young architects who have a mind to try their fortune with the rest is testified to by the fact of the writer's having received by post every now and then during the past few months requests for his opinion on the prospects of the profession in the new colonies. Now that we seem to be within measurable distance of the end of the war (Christmas-time is spoken of as about the date when Johannesburg and Pretoria should begin to be re-peopled), would-be emigrants are doubtless thinking of the purchase of their travelling kits. Therefore a little note of warning may now be not untimely.

There is no doubt, then, that the end of the war will see a rush back to Johannesburg and Pretoria on the part not only of the former inhabitants, but also of many newcomers. Then may be expected renewed commercial activity all over South Africa, a rise in the markets, and even perhaps a bit of a boom. Building activity is sure to revive with the rest. But do not let architect-emigrants deceive themselves. There are already architects who have established some sort of connection in South Africa in numbers more than sufficient to do all the work likely to be required for a year or two at any rate. And in spite of all warnings the returning stream is sure to carry with it a certain considerable proportion of new architects. How are they all to obtain work? It must not be forgotten that the coming boom, be it a big one or a small one, is one in anticipation of which the good people of South Africa both built and planned for months before the crisis came—nay, for years. The bolder and more hopeful among them have been building since shortly after the last boom faded away three or four years ago. The more cautious have contented themselves with having plans made by their architects, and from these a large crop of new buildings may be expected to begin to grow as soon as Civil Law is resumed. It is not, therefore, the newcomer architects who will benefit first, but those who were already established when the war broke out.

It is a maxim that can hardly be too often reiterated, and one which, if taken to heart, would save much disappointment, that unless a man has positive assurance of certain specific work to be put into his hands when he gets there, he need not rush off in the expectation of easily picking up a practice. One knows what Johannesburg has been in the past (and Johannesburg is here taken as the type of the whole of South Africa), and what it was round about its "booms" one is confident in predicting it will be again. There will be hundreds of wild-cat schemes. There will be thousands of the off-scourings of the world's surplus population to take part in them. There will be reckless gambling on a scale to put Monte Carlo to the blush. There will be feverish excitement, and an inevitable "slump" later on, at a date impossible to predict. That is, if the expected "boom" comes. If it does not come soon, one can but imagine the bitterness of the disappointment and the disjointing of many long and carefully-prepared schemes. At any rate, with so many things making for a condition of unrest, it is only the man about whom something is already favourably known who will be entrusted with the spending of good money. Let the man who has no influence beware of throwing himself rashly into the vortex. Influence has always told just as surely in South Africa as at home—even more so, on account of the ordinary natural business caution on the part of men with money to spend, a caution that will be readily understood when the character of the population is taken into account.

But for those who will be content to begin as draughtsmen it should not be so hard to find employment. Competent assistance has always been difficult to get, and salaries have been high. But there is this to be said on the other hand, that the history of South African affairs has always been distinguished by intermittency. It has been a tale of "booms" and "slumps" ever since the goldfields were discovered. We may fairly hope for a more steady, if a more chastened, modicum of prosperity in the future, but still it seems unlikely that the element of *variety* (shall we say?) will be altogether eliminated. This may mean periods of wearing idleness for the unfortunate assistant. And it should be borne in mind that a South African depression affects the whole sub-continent at once. The assistant who finds himself "reduced" may not hope to obtain other employment, as at home, by trying in the next street, or in the next town, or even, for that matter, in the next colony. He must wait idle, or turn his hand to something else, "until the times do alter."

CHANDOS HOUSE, QUEEN ANNE STREET, LONDON, W. BY ROBERT ADAM.

Further, let me quote once again the well-known South African paradox. Nothing, says the paradox, is ever certain about South Africa except its absolute uncertainty. This is sometimes varied by saying that one should always expect the unexpected to happen there. Whichever you prefer, it amounts to as much as that no one can predict anything of the future of the country, be he inclined to try in a pessimistic or an optimistic vein. And the writer fully expects that whatever shred of argument this dictum leaves to the foregoing remarks will also be demolished by the obvious imputation to which he is laying himself open—that of interested motives. "He is a Johannesburg architect," will be said, "so of course he wants to discourage other architects from going out." The writer can but protest his innocence and his honesty. After all, he is only advising caution. Moreover, he does not flatter himself that he is able in the smallest degree to dam the tide, the inevitable rush to South Africa of soldiers, sailors, tinkers, tailors, apothecaries, plough-boys, thieves—and architects, that is bound to take place. His obscure "Don't" would be as little regarded as *Punch's* famous one has been in a more vital matter.

Then let those who have made up their minds to go by all means go. And those whose minds are in process of being made up in one direction or the other (to whom alone all this is addressed) may find an interesting article in the August number of the "Fortnightly Review," by Mr. H. A. Bryden, on the prospects of future settlers. Mr. Bryden appears to be none too hopeful, though he does not conceal the fact that the country has many advantages. But he points out that the country requires a long period of steady development before much can be expected of it. The gold industry he considers to be a factor of which too much account can easily be taken, as the mines are bound to be worked out some day, and the other resources of the country are as yet for the most part untried. Well, of course, he may say that of the mines. It is a vague statement, and the same might have been said at any time during the past two centuries of the coal industry in Britain, and, indeed, possibly was said. Mining experts are by no means agreed as to the probable life of the South African gold-fields, so we may pass that part of Mr. Bryden's paper. The mines are likely to last our time at any rate. The one part of his paper which seems of most value to possible settlers is that which contains the suggestion of a hint as to where they may look for an immediate index to the future prosperity of South Africa. He very justly points out that it is a new agricultural population which is wanted, to keep in check and to leaven the unprogressive Boer population, and so to establish a permanent progressive population with a real stake in the country. In short, it is the best class of *settlers* that is wanted, not birds of passage, as so many of the former inhabitants might be styled. Now, the one thing most of all required for farming in South Africa, as elsewhere, is a good water supply; and this, also as elsewhere, but especially in South Africa, cannot be got without considerable outlay of capital for the construction of pumps and storage-dams. It is unlikely that many men of the class to make good agricultural settlers will have command of the requisite capital. Where is the money to come from? Mr. Bryden throws the onus of finding it on the broad shoulders of the Government. Therefore his index to what may be expected to happen is conveyed by this question—What will the Government do to assist settlers? The question is very pertinent, and its answer should be looked for before making up one's mind whether or not to emigrate. It should be looked for by farmers, but equally by people of "all trades." And equally by architects.

J. B.

On Reflection.

The Intercepting Trap.

We print on another page of this issue some Canadian comments upon the use of the intercepting trap in schemes of house drainage. Our readers will probably be astonished, not so much at the diversity of opinion, as at the backward state of sanitation in our great colony which these reports appear to indicate. True, our sanitarians have not yet discovered the best method of ventilating sewers, for indeed ventilation, whether of rooms or sewers, appears to be the most difficult subject with which the modern engineer has to deal; yet we thought by this time it was a generally accepted principle that the house-drainage system should, as far as possible, be separated from the main sewerage scheme. But apparently the Canadian system in the past has been to ventilate the main sewers by means of "breathers" or gratings at ground level in the front gardens, and it is hardly surprising, therefore, that our Canadian confrères are desirous of altering a condition of things that is both dangerous and unpleasant. At the same time to make the soil pipe the means of venting the sewer air does not by any means lessen the danger, for only the water seals of the water-closets and gulleys prevent the ingress of sewer air into and round about the house. If, as several of the writers point out, the tops of the soil pipes are frequently choked by frost, any pressure of the sewer gas will force the water seals and enter the house. This new evil would probably be worse than the original trouble. If the sewers are to be ventilated, they must be ventilated below the disconnecting trap, so that no possible danger of sewer gas forcing its way into the house system may be apprehended.

Architectural Rhetoric.

In these days we have all around us men who are rightly dissatisfied with modern architecture, and if an analysis is made it will be found that they are divided into two classes. The men in the one class talk and work; the others talk only. Now, however much good may have been accomplished through the zeal of extremists—and in some cases an enormous benefit has been conferred by these men—it must ever remain true that it is those who occupy the mean or middle position to whom we must look for substantial improvements, just as the character of the middle class of a nation may be taken as the barometer of the nation itself. In the matter of architecture especially we have clever exponents of what constitutes art in building, of the rules affecting æsthetics, of the sublimity displayed by the early builders, and of the base monstrosities of the modern architect. These exponents love to idealise, and this is where one finds fault with them: the result is that their teaching, excellent as it may be in essence, is thrown to the winds, as those to whom it is especially addressed at once seize upon its idealism, find it wanting when put to the practical test, and so dismiss the whole as mere rubbish. Congresses of all kinds are happy fields for the rhetorician: there he can air his theories to fellow spirits, though the resultant effect on the misdoers against whom these speeches are directed is remarkably meagre. To the real Englishman there is nothing like roast beef, there is nothing like common sense. It is of no use for an orator to stand on platforms—whether self-elevated or not—and tell the people in the pit below that they ought not to stay there, but should come up to his level, because the people look at the distance and either lose heart or fail to appreciate his superiority. To do any real good the orator must come down a long way and give his hearers a hand up. To apply this to building, take the case of the jerry builder. It is useless to discourse to him on art, on the necessity for a house to be expressive of its purpose, on the relation of solid and void: if you do this he will class you as unpractical, and practicality is one of his strong traits. No, tell him all those things when he has discarded his old methods, but first convince him with actual fact that his house will be much better without those terra-cotta dressings, without that senseless carving, without that tawdry ornament; and that by putting the money thus saved into better bricks, better carpentry and better mortar he will be benefiting himself, besides those who will live in his house (though this will not trouble him much). The same idea is applicable to the more important "architect": he wants educating without doubt, but let him have spoonsful of your architectural medicine at a time; if you want him to swallow a whole bottleful at once the chances are that he won't take any, and you will alienate him still further from the true principles of his art.

A Medley of Materials.

Every architect naturally tries, when he has the opportunity, to introduce some novelty into his building, and in attempting this he has been very prolific in the employment of various kinds of building materials for his exterior. Sometimes it is red brick with yellow courses, very often red brick and terra-cotta, then wood and plaster, stone and brick, &c. But it is the mixture of stone and granite with which we wish particularly to deal now. These materials are being constantly used at present in towns and cities for such buildings as banks and hotels, and in nine cases out of ten the result is most inharmonious. Granite is an excellent building material, and so is stone, but they should not be mixed haphazard. In the buildings referred to it is a very common practice to insert granite columns and pilasters at the sides of doors or windows, the rest of the structure being carried out in some light-coloured stone: the effect is most unpleasing when the building is new, and even after considerable weathering and toning down is still discordant. It would be a great improvement if buildings were more often erected of one material throughout, and even if this practice were carried to excess (which, however, is most improbable) the monotony would be less objectionable than the restless and incongruous effect caused by the miscellaneous use of various building materials, of which examples are to be found throughout the kingdom.

A Foolish Custom.

A most foolish custom is still kept up at Freiburg, in the south-west of Germany, on the birthday of the reigning Grand Duke of Baden. The tower of the minster at Freiburg is 400ft. high, and the custom is for steeplejacks to climb to the top. In the ascent the men have to leap from stone to stone, and as the space between these is considerable in some cases, it will be seen what an idiotic practice this is: one miss and the man would be dashed to the ground. When the top is reached a pistol is fired and then the descent is made, each man receiving five shillings from the State and getting a good dinner. Three men went up the tower the other day, and one of them performed acrobatic feats on an iron bar fixed about half-way up. Steeplejacks' work is never to be played with in this manner. In the ordinary course it is dangerous enough, and one wonders that not more accidents occur; but to deliberately make ascents like that mentioned above is foolhardy in the extreme. Because the custom is an old one there is no reason to continue it; that men have been fools is sufficient fact in itself—to copy them is greater folly.

THE PAVILIONS OF THE POWERS SEEN FROM BEYOND THE PONT DE L'ALMA. DRAWN BY F. HAMILTON JACKSON, R.B.A.

THE PARIS EXHIBITION.

By F. HAMILTON JACKSON.

III.—THE PAVILIONS OF THE POWERS AND THE COLONIES.

(*Continued from page* 75, No. CCXC.)

THE pavilions of the Powers form one of the great attractions of the Exhibition, and are picturesquely grouped in two parts of the grounds. First, in the Rue des Nations, which stretches along the side of the Seine, between the Pont des Invalides and the Pont de l'Alma, over the ground which used to be the Quai d'Orséy; and below the Trocadéro, above the Pont de Jéna, while a few are on the other side, near to the Eiffel Tower. The second section consists principally of pavilions of Colonies of different nations, and is quite as interesting and picturesque as the first. On the side of the Rue des Nations towards the Seine, starting from the Pont des Invalides, one passes first the pavilion of Italy, then those of Turkey, the United States, Austria, Bosnia, Hungary and Great Britain; then comes a space, on the other side of which rises the pavilion of Belgium, followed by Norway, Germany, Spain, Monaco, Sweden, Greece and Servia. Returning on the other side, the pavilion of Roumania comes first, followed by Bulgaria, Finland, Luxembourg, Persia, Peru and Portugal, while Denmark finishes the list. The various and incongruous buildings group with great picturesqueness from the other side of the river, and while some of them appear to be as strange as their designers could make them, others are composed of portions of historical buildings either reproduced by means of casting or reduced proportionately so as to fit together into a more or less homogeneous whole. The pavilion of Italy is externally, perhaps, the most imposing of all. The design is a sort of mixture of the Ducal Palace and St. Mark's, Venice, with well-defined levels, a gilded central dome crowned by an eagle with outspread wings, and smaller domes at the angles. Large windows with elaborate geometrical tracery are placed in the centre of each façade and light the interior well, which consists of one great hall in which are displayed examples of Italian manufacture. The walls, both internally and externally, are lavishly decorated with painting and gilding. The Turkish pavilion is in general effect white with decorations of tiles. It has one large dome and several small ones, a great tower at one angle and picturesque projections and recessions in the upper storeys. A large porch with pointed arch and voussoirs of coloured bricks gives character to the façade, and the domes are covered with aluminium, apparently. Details have been taken from many buildings at Constantinople and the celebrated mosque at Broussa, from the old Seraglio and the Seraskierat, from the Grand Bazaar, the fountain of Sultan Ahmed and several mosques. The American pavilion consists mainly of a great dome of not very pleasant proportion, on the summit of which a gilded eagle spreads its wings, and a porch in advance, after the manner of a triumphal arch, above which is a group of "Liberty upon the car of progress." Four galloping horses are guided by two children symbolising intellectual and physical progress, and in the chariot stands a young woman, no doubt the American young woman entirely emancipated. Between the columns below is an equestrian statue of Washington, a replica of the bronze offered to France by the women of America. Some paintings on the façade are quite as bad as the worst of the French paintings, and very much like them. Other paintings are within in the cupola. The Austrian pavilion is of ordinary Renaissance design, something like a Pall Mall club, but not quite so good, and does not call for remark. The next is that of Bosnia, with a cheerful blue and white impression, relieving itself against the grey of the Austrian building, and still more brightly against the dark Hungarian tower on the other side. It has a strong tower (recalling the times when the dwellings of the nobles were little fortresses), balconies made at Serajevo, and a loggia. Within are paintings by Mucha representing the history of Bosnia from Roman times, which have been highly praised. Next comes one of the most imposing pavilions, that of Hungary, picturesque in outline, sombre in colour, and made up of reproductions of portions of historical buildings most ingeniously fitted together to form one whole. The picturesque tower which dominates the composition is that of the citadel of Comorn, twice taken by the Turks, and retaken in 1597 by the Imperialists. Beneath it is a pointed arched passage, and from the angle a Virgin and Child look towards the river. This tower is attached to a fragment of the castle of Vajd Hunyad in Transylvania, which forms the façade towards the Seine. It is Gothic in style, and has three projecting octagonal turrets with peaked roofs, which form a striking whole with the great tower. The western façade consists of a reproduction of the choir of the Gothic church of S. Michael of Coutorhohely and the façade of a rococo house at Eperies. The side facing the Rue des Nations is a reproduction of the great gateway of the abbey of Yak, with a storey above—a very fine Romanesque work. Other portions have been taken from this abbey to form the interior court, while rooms have been copied from other historic Hungarian buildings, and a most interesting exhibition of historical and other objects of Hungarian art workmanship fills the glass cases in them. Next comes the pavilion of Great Britain, rather dwarfed by the Hungarian at one side with its great tower and the immense Belgian pavilion on the other. Its object has not been to impose, but to give an impression of what an English home, "a haunt of ancient peace," is like. The façade towards the river is a reproduction of that of Kingston House, Bradford-on-Avon, and the rest of the building is designed in the same manner, that of the seventeenth century, known as Jacobean. The long gallery within is adapted from that at Knole, and the plaster ceiling of the dining-room is copied from that of the Reindeer Inn, Banbury. In the entrance-hall are some fine tapestries made from Burne Jones's designs, by whom also are several pictures in the saloon, including the "Laus Veneris." The other rooms and the staircase are hung with very fine English pictures by Reynolds, Romney, Gainsborough, Turner and others, and Lord Cheylesmore's mezzotints decorate the corridor. The rooms have been furnished so as to serve as a residence for the Prince of Wales in case he should visit the Exhibition, and the furniture has been made by various well-known firms. In one of the bedrooms are some embroideries and other objects which were shown at the last Arts and Crafts Exhibition. The Belgian pavilion, which faces the English at the other side of an open space, is a reproduction of the famous town hall at Oudenarde, one of the most elaborate and fanciful of later Gothic edifices, an example of what has been called lacework in stone, in which the art of the carver and the exuberance of his imagination have almost passed the bounds of what is admirable, replacing the restraint and simplicity which should characterise all great art with assertiveness of craftsmanship and some confusion of detail. The central tower is crowned with a pierced and crocketed belfry, which contains a carillon and terminates in a crown, upon which a figure stands holding the banner of Flanders. The rooms within are decorated with carved woodwork and tapestries, and in some of them are views of Belgian towns painted upon the walls, while one has been fitted up as a reading and writing room for the Belgian pressmen. On the first floor is a reproduction of the famous coloured chimney-piece, while the walls are painted. Next comes the pavilion of Norway, a wooden erection painted red, with white woodwork round the windows and very sharp pinnacle roofs to the roof-turrets, which rise from green-tiled bases, a colour which appears again in the ground of the quaint decoration of fishes. Within is an exhibition of fishing implements and drawings of various fisheries, with a reduction of Nansen's *The Fram* and the implements used by him and his companions, and other objects and models. Again a small space, through which one may see the picturesque tower of the pavilion of Finland, and the lofty German pavilion attracts one's eye. The tower of this pavilion is crowned with a spire, the weathercock of which rises higher than the top of that of any other

nation. The architecture is a sort of *résumé* of German architecture of the Renaissance, details from different towns and periods being combined, in some parts with excellent effect. The walls are white in general tone, decorated with many paintings of symbolic and poetic subjects, such as Fire, Air, Water and Earth, Siegfried and other subjects from the Nibelungen Lied which symbolise the various elements. On several of the façades are ingeniously designed oriels of several storeys, and the entrances are arranged beneath wide arches, while large windows light the staircase and principal rooms. The hall which contains the staircase is spacious and lofty, and the pattern on the walls is very good, though a little over stiff for a repeating pattern, and the same may be said of some of the other rooms. The friezes and ceilings also are well intentioned, but the spirit of English design has not been caught, though evidently aimed at—only the mannerism. The paintings are not successes, though the work of celebrated German artists; they represent "Man's Fate," his life from birth to death and Resurrection, and the passions and plagues which are the bane of man, Avarice, Hatred, Envy, War, &c. On the first floor four rooms are decorated in the rococo style of the Palace at Potsdam, and the first is a reproduction of the Library of Frederick the Second. There are six pictures by Watteau lent by the Kaiser in these rooms, which are much admired, and a number of stained-glass windows are inserted in various rooms, which show a want of understanding of the material and how to use it. The Spanish pavilion is in the Plateresque style, that charming form of Renaissance design which developed itself in Spain, with rich framings of columns and arabesques around doors and windows, and a pretty courtyard with a two-storeyed arcade, beneath which the staircase mounts to the first floor. A square tower pierced by broad arches stands in advance towards the river and is crowned with a graceful pierced parapet. Within is a splendid collection of tapestries, armour and objects of historic art selected by the Spanish Queen herself from the treasures of the royal palaces. These magnificent tapestries are only taken out twice a year in Spain, when they are hung in the galleries of the royal palace at Madrid. The pavilion of Monaco is an imposing building consisting of a lofty crenellated tower attached to an Italian palace, which is ornamented with frescoes of the labours of Hercules, in reference to its ancient name, Portus Herculis. The tower is a reproduction of the ancient piratical nest from which the Grimaldis used to sally forth to prey upon Mediterranean commerce, and is surrounded with an elegant pillared loggia on the first floor. The pavilion now houses the scientific collections of the Prince, who has devoted himself specially to investigating the life of the ocean depths, and the productions of the Riviera. The strange Swedish pavilion comes next, a wooden construction covered with shingles highly varnished, without any architectural feature except the central tower, which itself is a curious mixture of complete and incomplete effect, and with spider-like galleries and webs of hanging pennons. This pavilion is certainly the most *outré* of the constructions in this part of the grounds. The pavilion of Greece comes next. It consists of a central cupola of slight curve, with four towers filling the angles of a Greek cross formed by low-pitched naves, the whole lighted by groups of narrow windows, and with a long colonnaded portico on each side, while towards the Seine is another of semi-circular form, the whole composition rising to the central lantern in a very effective manner. The pavilion of Servia, which is close to the Pont de l'Alma, is of somewhat the same plan, but the central lantern is higher and there is a portico of double columns along the principal façade, while the effect is at the same time more pretentious and more barbaric. Returning on our steps, on the other side of the way are the pavilions of Roumania and Bulgaria, neither of which are very interesting, though the latter has some exceedingly strange decorations, both as to form and colour, and in the former are some most interesting objects of ecclesiastical art and antique jewellery. Next comes the pavilion of Finland, which is perhaps the most original of all, and has several very good features about it. It is a long hall, with an apsidal end and two large tunnel-like doorways, one in each side, within a gable. The roof overhangs, and the hall is lighted by skylights and a row of low windows under the eaves. Between the great doors rises a tower of very quaint shape, which is terminated by a spire bearing a circular diadem half way up it, a motive which is repeated on flèches which pierce the roof above each pillar dividing the windows and at the extremities of the ridge. Bears and huge pine cones form the external ornamentation, with rude rosettes, and the coloration assists the aspect of savageness and strangeness. After this come the pavilion of Luxembourg, a reproduction of part of the ancient town hall, now the grand ducal palace; that of Persia, which contains on the second floor a reproduction of the Palace of Ispahan; those of Peru, of Portugal, and, finally, of Denmark. This last gives the impression of a citizen's house of the seventeenth century—a half-timbered house with larger triangular pieces inserted, upon which are carved rosettes and other ornaments. It has ranges of windows or open galleries, which give character, and each storey projects the width of the two beams, upon which are carved such ornament as one sees at Hildesheim in a similar position. The door is stained green and approached by steps, being recessed beneath a balcony, with picturesque effect.

(*To be concluded.*)

OLD BUILDINGS AROUND WIGAN.

THE pen drawings by Mr. Frederick J. Barnish printed on this page and the three that follow illustrate the style of building in the older districts around Wigan. Timber and stone are the materials chiefly used; but the stone buildings are generally of a somewhat later date. Bamfurlong Hall may be taken as a good example of local timber work. The date, 1577, together with the initials I A, may be found on the sill piece above the stone bay.

The smaller manor- and farmhouses mostly date from the seventeenth century, and the same traditions seem to have been preserved. The walls are of small roughly-squared local stone of a yellow-grey colour, which weathers to a brown-green in the roofs; these latter are formed of slabs laid in diminishing courses. The curious, though not altogether useless, custom of whitewashing the window reveals and mullions tends to give additional character externally, while brightening the long low rooms within. The pierced ventilator illustrated is of local squared stone from the Appley Bridge, Billinge or Parbold quarries.

DRAWN BY FREDERICK J. BARNISH

THE TRADES UNION CONGRESS.

THE thirty-third Trades Union Congress opened in the Town Hall, Huddersfield, last Monday week. There were about a million and a quarter trades unionists represented by 388 delegates from 140 trades and labour organisations.

The Chairman, Mr. F. Chandler, said there never was a time when the hearty co-operation of all workers was more required than to-day, not only if they wished to secure a reasonable proportion of the reforms which the Congress advocated, but to preserve those rights and privileges which for years they believed they enjoyed, but which were in danger of being whittled away by recent decisions in the courts.—The Mayor of Huddersfield (Alderman Hellawell), on behalf of the Corporation, gave the Congress a cordial welcome to the borough. —Sir James Woodhouse, M.P., associated himself with the hearty welcome which had been extended to the delegates by the Mayor. No good would arise from the impatient denunciation of those who did not at once agree with their opinions. Mere denunciation of capital and capitalists could not lead to any good. After all, the greatest victory which workers could achieve was to raise the character of their organisations. Above all things he would urge the delegates to encourage temperance, because intemperance was still the greatest curse and the bitterest enemy of the British workman.

Mr. William Pickles (House and Ship Painters and Decorators), chairman of the Huddersfield

Trades Council, was then unanimously elected president of the Congress. The following were elected as the Standing Orders Committee :—Messrs. A. H. Gill (Bolton), J. Haslam (Miners' Federation), C. Fenwick, M.P. (Northumberland Miners), J. R. Clynes (Oldham) and J. Jenkins (Cardiff).

Mr. Woods presented the Parliamentary Committee's report, which was taken as read. In it the Committee stated that to anyone who

AN OLD FARM NEAR WIGAN. DRAWN BY FREDERICK J. BARNISH.

had carefully observed the proceedings of several of the congresses it must be apparent that some alteration in the standing orders was necessary.

At the resumed meeting on Tuesday the chair was taken by Mr. William Pickles.

The President, in his address, said ten years ago the problem was, "How best to determine the rights and duties of the working classes in the existing social order?"; but one would think, judging from the resolutions agreed to at the last two or three congresses, that trade unions had gravely decided that the existing social order was not worthy of such adjustment, for they had pledged themselves to a programme which, if carried into effect, would entirely sweep away the present capitalistic basis of society and substitute for it a collectivist basis. That was a very serious step, which brought them into antagonism with the teaching of such men as Herbert Spencer and many of the modern disciples of Charles Darwin. He then entered into a lengthy argument, frequently quoting extracts from Darwin and Lubbock, as to the struggle for existence in animal and vegetable life and also primitive man. They must not delude themselves into the belief that there was not a kindred struggle taking place in human society. Survival of the fittest did not necessarily mean survival of the best; it meant that those creatures which could best adapt themselves to their surroundings would be the survivors. He thought he was justified in saying that in all forms of social evolution the economic factor was the dominant one, and that it was the factor which conditioned the struggle for existence and thus determined which should be the fittest to survive. The most noticeable aspect of present-day industry on the capitalist side was the tendency towards the joint-stock principle. The capitalist had learnt that, however beneficial competition was for the community, it was bad for himself, so instead of competing with his fellow-capitalist he joined hands with him, and together they could economise both in number of factories, in the amount of machinery, and also in the number of workers required; in other words, they could decrease the cost of production, and by eliminating competition could force up selling prices, thus gaining a power over the community which was greater than their class ever possessed in the past. The most noticeable feature on the workers' side was co-operation and specialisation in production, and, through the extensive use of machinery, a greater dependence upon the machine owner for the means of livelihood. The greed of the capitalist was unbounded, and would ultimately prove to be the undoing of the system against which the workmen were grumbling. This kind of monopoly must needs become intolerable, and the community must in self-defence adopt the simplest remedy, which was collectivism. The capitalist had socialised production and the people would socialise ownership and distribution. The rapid development of municipal enterprise was a further evidence of progress towards collectivism.

The third session was held on Wednesday in the Town Hall, Huddersfield, under the presidency of Mr. W. Pickles.

The standing orders having been suspended, the delegates from the American Federation of Labour were given an opportunity of addressing the Congress.

Mr. S. J. Kent said he believed that the interests of the man in America toiling for his livelihood and the interests of the worker in Great Britain were identical. The future of the United States, in his opinion, depended much more upon securing comfortable homes for their people than upon the maintenance of a large standing army.—Mr. John M. Hunter described the progress of the trade union movement in the West, where they had been so successful that nearly all the workers were organised. This had been brought about by their refusing to buy any article that was not manufactured by a trades unionist. The miners were the only men in America who had an eight-hours day all over the country, and that boon had been obtained solely through the action of the trade organisations.

The standing orders having been suspended, the delegates from the Co-operative Union, Limited—Mr. Vivian (London) and Mr. Booth (Huddersfield)—were allowed to address the Congress, and a vote of thanks to them was afterwards passed. The discussion on the amendment of the standing orders was then resumed, and a long discussion took place on a proposal to give the Parliamentary Committee power to rearrange and place on the programme of the Congress only such propositions as were generally acceptable as coming within the objects and aims of trades unionism. Eventually the amendment was agreed to.

At the meeting on Thursday, the following resolution was agreed to: "That, in the opinion of this Congress no scheme dealing with old-age pensions will be satisfactory to the whole of the workers in this country which seeks to subsidise existing pension societies or which connects pensions with any institution that will mark them with the stigma of pauperism, that the only legislation that will solve the problem presented by age and poverty in modern industrial life is that which recognises the pension as a civic right, which may be claimed by any citizen on reaching a given age, and instructs the Parliamentary Committee to take such steps to make this question of such prominence as to become one of the most pressing subjects at the next general election."

The following resolution was passed: "That, in the opinion of this Congress, it is desirable that many amendments to the clauses of the Workmen's Compensation Act, 1897, should be made, and that the principle of the Act should be extended so as to include all accidents in all trades and occupations both on land and sea, and that the Parliamentary Committee are hereby instructed to prepare legislation in order to give effect to the above resolution."

A resolution moved by Mr. Ben Tillett urging the Government to pass a compulsory Conciliation Arbitration Act and the appointment of a judge and court with authority to enforce awards by fines and imprisonment of persons refusing to accept the award of such court was negatived.

At the meeting on Friday, Swansea was chosen for the meeting of the Congress next year.

Messrs. John Weir (Dunfermline Miners) and Pete Curran (London Gasworkers) were chosen as the British delegates to attend the Convention of the American Federation of Labour, to be held at Louisville, Kentucky, later in the year. The following joint resolution was agreed upon :—"That this Congress is of opinion that one of the difficulties in dealing with the housing problem is the pressing need for a better and cheaper service of workmen's trains on all railways, so as to enable all classes of workpeople to travel cheaply and quickly between their homes and their places of employment; and this Congress instructs the Parliamentary Committee to do all in its power to support the Bill prepared by the National Association for the Extension of Workmen's Trains, which has been introduced into the House of Commons by Mr. S. Woods, which Bill makes provision for the issue of cheap return tickets to all classes of workpeople, by all trains up to eight o'clock in the morning, at the following fares :—Twelve miles, return fare, 2d.; 16 miles, 3d.; 20 miles, 4d. The tickets to be available for the return journey by any train carrying third-class passengers; and that all trades unionists support only those candidates who are favourable to the above reforms."

On the motion of Mr. T. Smith (Barking) the Congress passed a resolution that the time had arrived when the hours of labour should be limited to eight per day in all trades and occupations in the United Kingdom, and calling upon trades unionists to make this one of the test questions at all parliamentary and municipal elections.

A consolidated resolution in regard to the housing of the working classes, calling upon the Government to introduce legislation making provision for dealing with the owners of unhealthy houses, extending the time for the

BEBINGTON CHURCH, CHESHIRE. DRAWN BY FREDERICK J. BARNISH.

repayment of loans to 100 years, and instituting fair-rent courts, was carried.

At the concluding meeting on Saturday a resolution was passed for reaffirming the conviction of the Congress that the raising of the age standard was one of the necessary reforms in the interests of the whole community. A resolution was also agreed to "That this Congress views with alarm the changes recently

made by the Government in the education system, and emphasises the importance to the working classes of the right hitherto enjoyed by them of being enabled to educate their children in the higher grade schools up to seventeen and eighteen years of age, the limits still allowed to Scotch children, and resolves that the Government be strongly urged to withdraw the order limiting the age to fifteen years, so as to allow equal educational opportunities for English and Welsh children to those enjoyed by Scotch."

THE INTERCEPTING TRAP.

EXPERTS' OPINIONS ON ITS EFFICIENCY.

OUR contemporary "The Canadian Architect and Builder" has been collecting the opinions of a number of well-known Canadian architects, engineers, plumbers and physicians on the efficiency of the intercepting trap as a means of preventing the entrance of sewer gas into the house-drainage system; and we take the liberty of giving below a *résumé* of these opinions. Messrs. Burke and Horwood (Toronto) say:—"The entire absence of a trap in house drains advocated the abolition of main traps on house sewers, and I succeeded in inducing the town of Brockville to adopt my recommendation. The system has now been in operation for twelve years, and has proven entirely satisfactory. The sewer system is well ventilated by means of the house sewers, notwithstanding the fact that the manholes are completely closed over by ice and snow during the winter months. The so-called sewer gas should not be produced in a properly constructed and properly ventilated sewerage system, and the foul smells so offensive in many of the cities are unknown in Brockville, Brantford and other places where the separate system has been adopted and main traps on house drains omitted."

Mr. C. H. Rust (city engineer of Toronto) says:—"I am of opinion that it would be necessary to have all of the pipe inside the street line of iron and laid very carefully under rigid inspection. Under these conditions a portion of the sewer gas would probably find its way out through the ventilating pipe at the top of the houses, but the greater portion would probably still follow the lines of least resistance and pass in or out of the manhole gratings in the centre of the street. As, however, the private drains of this city are practically all laid and are very numerous, it is not practicable to make the

BAMFURLONG HALL, FROM THE MOAT. DRAWN BY FREDERICK J. BARNISH.

is the ideal system. There are two difficulties in the way, however. The first is that the great majority of drain connections are now trapped; the second is that houses vary very much in height, so much so that the top of the soil pipe in one house might be below the level of the upper storey windows in the adjoining house. This would be a source of danger in the case of the wind blowing towards the higher house, and the danger would be especially great if but few houses were trapless, as the bulk of the sewer air would then pass through the drains and soil pipes of these houses, concentrating the sewer air in that certain locality. If legislation could be obtained to abolish all traps and make the tops of all soil pipes extend above any window or future window, the scheme might be feasible. Of course it would be very unsightly to have a tall outlet upon the roof of a low house, and we doubt if such a thing could be carried out."

Mr. Willis Chapman (Toronto) says:—"In a properly designed sewerage system main traps are not necessary. The so-called breathers are in my opinion a menace to the health of the citizens. The only practical method of properly ventilating street sewers is through the house soil pipes, each of which should have a free opening from the main sewer to a point above the roofs of the buildings. In 1888 I change at this date, especially as the sentiments of the people would probably be against having a direct ventilation of the sewer through their houses, no matter how well it may be done and no matter how safe it may actually be."

Mr. M. B. Aylesworth (Toronto) says:—"I am glad to express my opinion as to the advisability of omitting the trap from private drains at connection with street sewers. On all work done in accordance with modern usage that trap, with its hideous "breather," is not only useless to the house plumbing, but an evil to the street sewer, in retaining gases which would harmlessly escape through the thousands of soil pipes if permitted."

Mr. W. H. Meadows (plumbing inspector, Toronto), says:—"Allowing that some of the traps have become unsealed and soil pipe terminus becomes choked from hoar frost, sewer air must enter the house, as it cannot escape otherwise. Then, again, when buildings are of uneven height, one soil pipe of a low building may be discharging sewer air under a window of a tall building, and it would be useless to run long lengths of pipe above the roof, as they would close up with hoar frost. These and many other reasons might be called disadvantages, and the one or two in its favour called advantages—should they be placed in the scales the omission of main trap would not be in it. Some people claim that the main trap becomes foul; this should not be if the trap is made and set properly, for there is the same amount of (and sometimes more) water to keep it clean than keeps the drain clean. All things considered, I think it very bad policy under the circumstances to omit the main trap."

Mr. J. Rawson Gardiner (Montreal) says:—"If all soil pipes of a town run through the roof and have all their joints secure the trap can be dispensed with and thereby procure ventilation of the sewers over the housetops and also save the cost of the trap. There is also no doubt that the simpler the drainage system is made the better and more efficient it is and less chance of syphonage, provided that it is sanitary. In the event of the trap being done away with I would suggest that all drainage be placed under a compulsory pressure test, as neither the smoke nor peppermint test is altogether satisfactory, in my opinion."

Mr. Andrew T. Taylor (Montreal) says:—"I have always insisted very strongly on the necessity of an intercepting trap between the house and the main sewer and then thoroughly aërating the house system by fresh air inlets and the house soil pipe, carried the full diameter up to 3ft. or 4ft. above the top of roof. If the main drainage system were properly and sufficiently ventilated there would not be so much need of the intercepting trap, but I know of no system which does this perfectly."

Mr. J. W. Hughes (Montreal) says:—"The advocates of the intercepting trap do not deny the necessity of sewer ventilation, but they attempt to provide for it in detail instead of as a whole, and so defeat the object they wish to attain. Conditions exist in northern climates during that portion of the year when snow is on the ground that completely neutralise the effect of the perforated manhole covers over the street sewers, and during such time, in cities where the intercepting trap is in general use, the main sewers are without ventilation, and a serious condition of affairs exists, as the buildings being heated to a greater degree than the outer air has a cupping action, and draws the air from the sewers into them, beneath the frozen and almost impervious top soil and paved roadways where the soil is porous. This is sure to occur, even when the buildings are situated a considerable distance away from the main sewers. Sewers breathe! Under certain conditions the air will rush into them; again it is being expelled with considerable force. Atmospheric conditions partly account for this, but the varying quantities of solid and liquid matter constantly entering and leaving them has an important bearing on the question. Any attempt to bottle up the sewer air will end in failure; such being the case, proper breathing places must be provided, and what place so suitable as above the roofs of the buildings, where the wind will disperse the foul gases and the light and air disinfect them?"

Professional Practice.

Huddersfield.—The "Commemoration" Stone of the new temperance hall in Princess Street, to take the place of the Victoria Hall in Buxton Road, was laid last week. The building is arranged for club premises in the basement, with an entrance from Princess Street, and contains large billiard-room for four tables, reading-room, caretaker's room, lavatories and meeting rooms. On the ground floor, with entrances from Princess Street and Page Street, there is a hall 41ft. 8in. by 72ft. 6in., with raised platform and orchestra, two committee rooms, lavatories and corridors. On the first floor (which is provided with staircases from the front corridor and Page Street entrances) the gallery is arranged on each side and back end. Secretary's rooms are provided on each side of the orchestra, and a meeting room, 32ft. 9in. by 24ft. 9in., with a suite of lavatories, are arranged to the front. The building will be heated throughout with hot water. The hall has seating accommodation for 686 persons. The following contractors are entrusted with the work, viz.:—Messrs. John Radcliffe and Sons, masons' work; Messrs. Wood Bros., joiners' work; Messrs. Milnes and

PIERCED VENTILATOR IN A FARM GABLE AT APPLEY BRIDGE.

Garside, plumbers' work; Mr. T. B. Tunnacliffe, slaters' work; Mr. W. E. Jowitt, plasterers' work; Mr. Allen Jackson, painters' work; Messrs. Henry Brook and Co., Limited, iron-founders' work; Mr. John Cooke, concreters' work; and Messrs. Tomlinson and Milan, Limited, hot-water engineers' work. The work is being carried out from plans prepared by Mr. Ben Stocks, architect, St. Peter's Street, Huddersfield. The cost is estimated at about £5,000.

Llangarren.—The parish church has lately been reseated and restored. The old-fashioned high-backed seats have given place to modern pews; a boarded floor has been superseded by a new block flooring; and a vestry, made from some of the old wood of the church and screened off with iron rods attached, is situated in the north aisle. The former chancel tiles have been removed, and new ones (the gift of the architect, Mr. Seddon, of London) substituted. The chancel seats have been made out of the old oak by the contractor, Mr. Robert Clarke, Commercial Road, Hereford, who has also re-made the old-fashioned Jacobean pulpit. The font has been removed from the centre of the church to near the door, and two stoves, which looked unseemly in their original positions, have been placed one at each end of the sacred structure. The roof, moreover, has been cleaned, and snow-boards have been provided. These alterations have been carried out at a cost of between £400 and £500.

Mellor.—A stained-glass window has been added to the Wesleyan Church at Mellor. The window measures 16ft. by 10ft. The figures were designed by the late Sir Edward Burne-Jones and the work executed by the firm of the late William Morris. In the centre of the window is the figure of Christ, with the cross and chalice, representing love and self-sacrifice; on either side of this representation are figures of SS. Matthew, Mark, Luke and John, with the traditional emblems above them. In their hands are scrolls bearing selections from their respective writings. In the central part of the tracery above the lights is the figure of our Lord in judgment, whilst in the minor openings of this same part of the window are adoring angels, &c. The window has been executed under the superintendence of Mr. Dearle, of the Morris Company. A new chancel has also been erected, containing a new Communion table of solid oak by Messrs. Harry Hems and Sons, of Exeter. A pulpit of alabaster and carved oak and choir stalls have also been erected. A new organ is to be erected at a cost of £600, and the work has been placed in the hands of Messrs. Willis, of London.

Perth.—Some time ago a scheme was set on foot by the Police Commission for the erection of a number of blocks for housing the working classes, and a piece of ground at the corner of the Old High Street and Milne Street was secured for the erection of houses for working men. Plans were prepared by the burgh surveyor, and two blocks were proceeded with. The building, which is now nearing completion, comprises twenty houses in each of the two blocks. The structure is plain, but substantial, the front elevation being built of red sandstone from Corncaple Quarry, Dumfriesshire. Each block is three storeys high. There are three classes of houses, ranging in rental from £8 10s. to £5, and, notwithstanding this low figure, they have every modern convenience. Each of the houses have two apartments—a kitchen and a parlour. In the higher-rented class the kitchen is 14ft. in length, exclusive of a bed recess 9ft. square. The height of the room is 9ft. 10in., and the length about 13ft. There are tiled fireplaces in the rooms, while the kitchens are fitted up with ranges with self-heating ovens. The only difference between the £8 10s. and the £7 10s. houses is that there are no fireplaces in the rooms of the latter. All the houses, of course, will be supplied with gas and water. There is wash-house accommodation, two tubs and a large boiler being connected with each wash-house. The whole of the open court, which is of considerable dimensions, is concreted. In all probability the dwellings will be ready for occupation in the course of a few weeks. There are still another two blocks to be erected. The following were the contractors:—Mason work, Mr. Michael Kerrigan; joiner work, Mr. D. Crichton; slater work, Mr. Daniel M'Lauchlan; plumber work, Mr. A. J. Davidson; iron work, Mr. William Hume; plasterer work, Messrs. John Peebles and Sons; painter work, Mr. P. K. Donald, Blairgowrie. The clerk of the works is Mr. Alexander Robertson.

A FARM AT APPLEY BRIDGE, NEAR WIGAN. DRAWN BY FREDERICK J. BARNISH.

Seaforth.—A new Congregational Church has just been opened. The new church adjoins the school chapel and has frontages to Elm and Gladstone Roads. It is Modern Gothic in style, with a nave 38ft. 3in. wide, with arched arcades on either side, ambulatory aisles, transepts, and also an end gallery over the vestibule. The church will seat nearly 600 people, including the choir, which is arranged in stalls on a raised dais in front of the rostrum. The organ chamber is in an arched recess at the back of the rostrum, with trackers brought underneath, so that the organist is in front of the rostrum and in close proximity to the singers. The entrance to the church is by two porches in Elm Road front, with wide vestibules under the gallery. The total length is 70ft. 6in. The church may be entered from the present school chapel or from Gladstone Road by a side door. In this part there is a deacons' vestry, a minister's vestry and lavatory, also a wide passage, which will be used as an assembly room for the choir. Over the deacons' vestry is the church parlour, which is approached by way of the gallery of the school chapel. The exterior treatment is in common brick, with Whiston stone dressings, and the roof is covered with American unfading green slates. The jambs, mullions and tracery are of stone. There is a gallery window of five lights, with traceried and cusped flings to the arch in the Elm Road gable-end. The clerestory and transept windows have also traceried heads. All are filled with lead glazing and clear cathedral glass. The interior has the surface of the walls finished in plaster and the joiners' work in pews, rostrum, choir stalls, &c., is of American canary whitewood, stained green and varnished. The roof is pitch pine unvarnished, with shaped and trussed principals, and is open to the ridge and sheathed on the underside of the spars with boarding. The flooring is in pitch-pine boards, laid solid on sleepers embedded in a concrete floor, and the outer porches are tiled. The ventilation is combined with the heating arrangements, with air inlets connected with hot-water radiators. One feature of the heating arrangements is the placing of radiators on the base of the clerestory windows, with a view to stopping down draughts. Hopper vents are fixed in the windows and there are louvred exits in the apex of the gable and controlling doors by which to regulate them. The church will be illuminated by the electric light. It has been about twelve months in course of erection. The architect is Mr. J. H. Cook, St. George's Crescent, Liverpool. Mr. James Holme, Hicks Road, Seaforth, was the general contractor, with the following sub-contractors:—Joiners' work, Messrs. Haugh and Pilling, Liverpool; slating and plastering, Messrs. Henry Johnson and Sons, Liverpool; masonry, Mr. John Green, Everton; plumbing, Messrs. Joseph Fowles and Sons, Liverpool; heating, Messrs. Dargue and Griffiths, Liverpool; electric lighting, the Liverpool and District Electric Lighting Company. The communion table and chair were supplied by Messrs. Jones and Willis, Liverpool; seat rugs by Messrs. Dix, Liverpool; and matting for aisles, carpets, &c., by Mr. A. C. Weeks, of Seaforth. The building has cost about £4,850. An organ by Messrs. Hele, of Portsmouth, will be placed in the church.

Weston-super-Mare.—The public library and museum, which has been erected as a memorial of the Queen's Diamond Jubilee, was opened last week. The site of the building, which occupies a commanding position in the Boulevard, was originally acquired with the view of erecting thereon a suitable memorial of the 1887 Jubilee, but the movement failed. A definite scheme was formulated in connection with the Diamond Jubilee whereby it was proposed to erect a free library, museum and picture gallery at a cost of £6,000. With a sum of £3,250 it was decided to erect one half of the projected building, the remaining portion to be added at some future occasion. The work has been carried out on the joint plans of Mr. H. F. Price and Messrs. S. J. Wilde and Fry, and has been executed by Mr. Charles

Addicott. The building has been treated in the Renaissance style, the materials employed being local bluestone, as far as the plinth level, and red Cattybrook brick relieved by freestone dressings and carvings. On either side of the entrance, placed in a spacious niche, are handsomely executed groups of sculpture, emblematic of "Literature," "Science" and "Art," whilst the commemorative character of the building is emphasised by an effective scheme of carving immediately above the entrance. Upon the ground floor are situated the reading room, reference and lending library departments, ladies' room, librarian's apartment, and the usual offices, whilst the museum and picture galleries are located on the upper floor.

THE ORDNANCE SURVEY.

A BLUE-BOOK just issued gives a report of the progress of the Ordnance Survey up to March 31st last. The report states that during the year 1899-1900 good progress has been made with the various services on which the Ordnance Survey is engaged. A special survey, on a very large scale, of barrack sites on Salisbury Plain has been carried out for the War Office. A special revision on the 1-500th scale of Admiralty property at Chatham has been carried out for the Admiralty. For the last two or three years the Ordnance Survey has made special surveys for the Congested Districts Board in Ireland on repayment. This year the amount of this work has been unusually large. The preparation of special maps and the supply of ordinary maps for the Land Registry have increased very rapidly. As regards the ordinary work of the Ordnance Survey, the revision of Great Britain has advanced so rapidly that it has been found possible to reduce the force employed on this service without risk of delaying the completion of the present revision beyond the estimated time. The staff which has been spared from Great Britain has been transferred to Ireland, with a view to accelerating the resurvey of that country, which has proceeded very slowly owing to the laborious nature of the work. The revision of the 1in. map of Great Britain is complete, and the whole of that map is now published in a uniform style and revised up to a recent date. Since its commencement the survey has been organised upon a military basis and carried out under military superintendence. The chief supervision, from the Director-General downwards, has been vested in officers selected from the corps of Royal Engineers. The 13th, 14th, and 16th Companies of Royal Engineers were raised for the Ordnance Survey in 1824 and 1825, and the 19th Company was added in 1848. These companies have been continuously employed on the survey to the present time. Two complete survey sections, each commanded by an officer, have been despatched to South Africa, and a third section has been got ready for despatch if required. The party of two officers and six non-commissioned officers and men despatched to Wei-hai-wei have completed the survey of that place, and the non-commissioned officers and men have recently rejoined the Ordnance Survey. Three non-commissioned officers of the Ordnance Survey are still employed on the survey of Bermuda for the War Office. This survey is nearly completed. A party of one non commissioned officer and four men has been sent out to Gibraltar to carry out a revision of the survey of that place for the War Office, and three non-commissioned officers and men have been provided for service with boundary commissions on the Niger and Gold Coast.

Sacrilege at Chester Cathedral.—The workmen engaged on the restoration of the St. Oswald's transept of Chester Cathedral, which is being carried out to commemorate the late Duke of Westminster, noticed on Saturday morning that their too's had been removed, and an enquiry led to the discovery that the Cathedral had been entered in the night by burglars who had used the workmen's tools to break open the collection boxes. The burglar, or burglars, entered the building by smashing a stained-glass window in the Canons' vestry.

A A. PRIZE LIST.

THE following is the prize list of the Architectural Association for the session 1899-1900:—

A.A. Travelling Studentship, value £25 and silver medal, C. H. F. Comyn; A A. Medal, S. Towse; Hon. Mention, J. E. Forbes; A.A. Essay Prize, J. MacLaren Ross; Architectural Union Company's Prize (value £10), P. J. Turner; Banister Fletcher Bursary and Medal, Arthur Stratton; Andrew Oliver Prize, F. C. R. Palmer; Arthur Cates Scholarship, L. W. Ensor.

Lectures (Division I.):—C. M. Crickmer (prize, value £1 1s.), B. D. Tracey, H. W. Currey.

Lectures (Divison II.):—C. H. Gage (prize, value £2 2s.), F. B. Chester, J. D. Hunter.

Studio (Division I.):—M. Skinner (prize, value £1 1s.), S. H. Goodwin (prize, value 7s. 6d., and certificate).

Studio (Division II.):—A. A. Carder (prize, value £2 2s.).

The students placed in order of merit below include also those who entered for single lectures. These students do not, therefore, compete with those in the foregoing list, all of whom took up a complete course of lectures in a division, and thus became eligible for the prizes offered to the students taking the highest place in a division.

Lectures (Division I), Greek and Roman Orders:—S. V. North (book prize), C. M. Crickmer, H. Greenly. Elementary Construction:—C. M. Crickmer (book prize), H. H. Dawson and J. R. Tyndall (*æq.*), H. W. Currey. English Architecture:—C. M. Crickmer (book prize), H. Greenly, H. J. Gravenor and A. Dicken (*æq.*). Mediæval and Renaissance:—C. M. Crickmer (book prize), H. Greenly, A. Dicken. Elementary Physics, Formulæ and Calculations:—L. W. Ensor (book prize), A. Potter, E. O. Payne. Plane and Solid Geometry:—L. W. Ensor (book prize), E. O. Payne, B. D. Tracy.

Lectures (Division II.).—Materials, their Nature and Application:—C. H. Gage (book prize), T. Bee, R B. Rowell. Construction:—T. Bee (book prize), C. H. Gage, C. L. Fleming-Williams. Drainage and Water Supply:—E. L. Wratten, R. Findon, C. E. Varndell. Ventilation, Lighting, and Heating:—T. Bee, C. H. Gage, J. G. Walker. Professional Practice:—T. Bee, P. B. Dannatt, R. Findon.

Elementary Class of Design:—A. Durst (prize, value £3 3s., and bronze medal), A. A. Carder (certificate), M. J. Dawson (hon. mention). Advanced Class of Design:—H. M. Cautley (prize, value £5 5s., and bronze medal), J. E. Forbes (certificate), C. H. F. Comyn (hon. mention).

Extra Subjects.—Quantity Surveying:—J. T. Burt, R. B. Rowell, J. H. Watkins. Mensuration, Land Surveying and Levelling:—H. E. Rider (book prize), W. A. Jeckells, H. J. C. Marshall.

New Baths at Cheltenham have been built by the Corporation by reconstructing the Montpellier Baths. The external appearance of the baths has undergone but little alteration. In the interior the large swimming bath remains. The private baths are in an adjoining and communicating building of two storeys, and access to the baths will be by means of a hydraulic lift. On the ground floor are the first-class baths, with dressing rooms attached. These comprise two immersion baths, a 6ft. bath combined with shower and spray, and a large plunge bath. On the floor above are two first-class and three second-class baths, access to which is obtained from a corridor 70ft. long and 5ft. wide. The two first-class baths consist of 6ft. nickel-plated horizontal baths, with shower and spray baths adjoining, while the second-class baths are ordinary 6ft. porcelain baths. All the bathrooms have marble mosaic floors. There are also baths of the third class on the ground floor, but separated from those of the first class on the same floor, the entrance to them being from the rear. They consist of three 6ft. baths and three washing or spray baths, and are neatly fitted up, with comfortable dressing rooms adjoining.

Builders' Notes.

The London Office of Williams Brothers and Company, of Chester, has been removed to 18 Hart Street, Bloomsbury, W.C.

The death of Mr. William Shaw, a well-known Richmond builder, occurred in Newbiggin last week, in his 80th year.

The British Institute of Certified Carpenters visited Apsley House last Saturday, by permission of His Grace the Duke of Wellington. Thirty-seven members attended.

The Farnley Iron Company, Limited, of Leeds, have been awarded a gold medal for the fireclay goods—glazed bricks and sanitary ware—exhibited by them in Class 72, and also a gold medal for their best Yorkshire iron exhibited in Class 64, at the Paris Exhibition.

An Insanitary Marylebone Area is to be swept away, consisting of a squalid triangle of small dwellings bounded by Lisson Street, Bell Street and Burne Street, inhabited by about five hundred people. The matter has gone before the London County Council to be dealt with under the Housing of the Working Classes Act.

Fined for Building without Notice.—At Tipton last week Thomas Tranter, builder, of Tipton, was summoned by the District Council for a breach of the by-laws by commencing the erection of four houses on land off Waterloo Street without giving notice to the Council of his intention to do so and submitting the plans for approval. Defendant was fined 20s. and costs.

Builders' Stock Burnt.—Last week the works of Messrs. Schofield and Mills, builders, &c., in Allotment Street and Burritt Street, Rochdale, were destroyed. Messrs. Schofield and Mills had in their works pitch-pine doors and other woodwork for twenty houses which they are erecting. A large quantity of new furniture had also been placed in the works. These goods were consumed. The heat was so intense that cottages opposite the works were scorched. Part of the end wall in Allotment Street fell outward. The damage, which will amount to £1,600, is only partly covered by insurance.

Amalgamation of Blackpool Brickmakers.—For some years past brick-making in Blackpool has been an important industry. There have been times when it was utterly impossible to regulate the supply commensurate with the demand. Also it has been a difficult matter to keep the whole of the brick kilns working. The recent increased cost of coal, an important matter in itself, the unsatisfactory credit system, and the great amount of competition which has sprung up on all hands, have all tended to bring about some understanding amongst the whole of the brickmakers in the town who produce machine-made bricks. The manufacturers have now decided that all bricks shall be ordered through one agent or central office, at a uniform price per thousand agreed upon. Mr. J. Lowes, of Warbrick Road, has been appointed manager and secretary, offices have been taken at 17 Birley Street, and the firms included in the "combine" are Messrs. Cardwells, Moister and Fenton; Wilson Bros. and Oakland, Limited, Moss Side, Marton; Joseph Fielding and Sons, Blackpool; Jas. Cardwell and Bro., Blackpool; William Eaves and Company, Blackpool; W. and R. Fenton, Blackpool; the Woodland Grove Brick Company, Limited, Blackpool; and F. Saville, South Shore. The total output of bricks of these firms is estimated at about two millions per week. The association is styled the Blackpool Brick Exchange, and it will commence operations on September 22nd.

The "Anglo-Saxon Guide to the Paris Exhibition" will be useful to anyone visiting the show. This book of 248 pages is very cheap at 1s. nett, and is published by Boot and Son, Limited, of 24 Old Bailey, E.C. The guide is illustrated, and contains a great amount of information about the Exhibition and Paris generally. A good feature is the introduction of a list of the British awards.

Bricks and Mortar.

APHORISM FOR THE WEEK.

But Ptah only answered, "Let them build, sister, let them build." And Neith answered, "What shall they build if I build not with them."—RUSKIN.

Our Plates. THE German, Hungarian, and English pavilions are described in the article on the pavilions at the Paris Exhibition which begins on p. 103 of this issue: the Algerian pavilion will be dealt with in the concluding part of the article, which will appear next week. The chalice by Mr. H. Wilson is a good specimen of the beautiful work produced by this well-known architect and art-craftsman: the church at Brighton for which it is intended is practically completed, though certain extensions are contemplated. Mr. Drury's design for a lamp standard shows how elegant these can become when in capable hands: the arrangement of the figures is most pleasing.

Restoring Some Early Frescoes. THE ancient wall paintings on the vault of the apse of St. John's Chapel in St. Mary's Church, at Guildford, have become badly decomposed, and are now being restored under the direction of Professor Church, who has already done much for the preservation of the frescoes in the Palace of Westminster. It is understood that the Professor has prepared a special mixture for dealing with the paintings, which is being applied by means of a spray, as was done in the case of the Westminster frescoes. The paintings which are now being operated upon at Guildford date from the early part of the thirteenth century, and are believed to be the work of William the Florentine, who was one of the Court artists of King Henry the Third, and to whom is ascribed the decoration of certain apartments in Guildford Castle, where the King resided.

The Palace of the Popes. MR. H. W. BREWER, in a letter to the "Daily Graphic," says: "The French Government are about to protect and restore the ancient palace of the Popes at Avignon, and it is quite time that some steps should be taken to repair and remove some of the disfigurement of what is perhaps the most remarkable palace of the Middle Ages. May I express the hope that this will not result in some French architect being turned loose into the grand old building to exercise his views of Gothic architecture, and what it was, or, according to his ideas, ought to have been. This kind of work may be seen at Mont Saint Michel, and the result is simply disastrous. The most mutilated fragment of genuine thirteenth or fourteenth century Gothic work is infinitely preferable to the smartest and most expensive nineteenth-century copy, especially when the old work has been destroyed to make way for the spurious imitation. . . . The old palace at Avignon was built during the very best period of Gothic architecture, and it is truly a grand work. The walls, which are enormously lofty and about 12ft. thick, enclose several open courts and a great number of vast apartments, which were all more or less mutilated when the building was converted into a barracks in 1812. They are described in Wood's 'Valley of the Rhone,' which, by the way, contains the best description of Avignon I have come across. The palace is rather grand than ornamental, and the architecture is very English in character! Indeed, it might be an Edwardian castle, and, like many English castles, it is situated upon the bank of the river, instead of upon a hill."

Excavations at Waverley Abbey. THE site of Waverley Abbey, near Farnham, has been the scene of some excavations which have produced interesting results. The abbey was founded in 1128 by William Gifford, Bishop of Winchester, the site selected being a most beautiful one, surrounded on three sides by pine-clad hills, and with the winding Wey running by the side of the abbey walls. The abbey buildings covered an area of about sixty acres, but comparatively little of the grand pile now remains. Scattered here and there about the meadows are fragments of the old buildings, for the most part hidden by thick masses of ivy or sombre yews, which give them a picturesque appearance. The best preserved portion is the dormitory, with its interesting crypt, and the remains of the refectory with three lancet windows in the south wall. The excavations have been taken in hand in the hope of tracing the complete ground plan of the original building, and the results so far have been very satisfactory. Many interesting discoveries have been made, including the bases of handsome columns, large paved doorways, tiled floors, fragments of ancient glazed pottery, leaden pipes which supplied the abbey with water from the Ludwell Spring near by, and large quantities of human bones.

A Great French Prison. AT a distance of about eight miles from Paris is situated the vast new prison of Fresnes-les-Rungis, which takes the place of the recently demolished Mazas, Grande Roquette and Sainte Pelagie prisons in the French metropolis. Fresnes Prison is not built on the radiating or star form, but consists of four immense rectangular blocks, with a fifth block for an infirmary. It is mainly on the cellular system and contains 1,824 cells. But, as there is also provision for 400 prisoners in association, the establishment can receive 2,224 prisoners, besides many of their officers. One of the special features is the abundant provision for the entrance of sunshine and air, not only in the halls and corridors, but also in the cells. The windows in the latter are of most unusual size for a prison, being about 4ft. square, and on a fine day the sunshine streams down from the lofty skylights—the prison being four storeys in height, or five tiers of cells besides the basement—and the air both in cell and passage has free course. Underneath the prison are large cellars and store chambers for materials and goods of all kinds. Tramways, for the conveyance of food and stores, run along the immense passages, each of which is about 1,000ft. long. Lifts ascend and descend from storey to storey. At night the electric light is everywhere. Electric power also works machinery of various kinds in the bakeries and wash-houses. A very large hall is used alternatively as chapel and schoolroom, with a fine altar and sacred figures at one end and also a few paintings on the walls. The architect of this great new prison was M. Henry Poussin. The rectangular block system (as at Wormwood Scrubs, London) was chosen because it is found to be better adapted for light and ventilation than the radiating plan, for in the latter some of the walls and windows, where the wings approach the centre, are necessarily involved in comparative shadow or closeness.

Royal Architectural Museum. MR. MAURICE B. ADAMS, hon. secretary to this institution in Tufton Street, Westminster, recently wrote to the "Times" newspaper as follows:—"An effort is now being made to inaugurate a development of this museum for the further increase of its usefulness, and with this end the co-operation of all interested in architecture, sculpture, and the applied arts is solicited. Your readers are not invited to assist in a lifeless project or interest themselves in a dead cause. The museum comprises a unique collection mainly of mediæval examples founded under the presidentship of the late Mr. Beresford Hope by Sir Gilbert Scott, Professor Ruskin, and others associated with the so-called Gothic revival. Whatever may have been the shortcomings of this movement, there remains no doubt as to the widespread influence of the zeal and enthusiasm which animated its originators and their immediate pupils. The best buildings of the present day owe much of their merit to the example of Pugin, Street, Butterfield, Pearson, and Sedding. The Royal Architectural Museum, thus founded to enable students and art workers to study the best examples of applied sculpture and architectural ornament, is associated with one of the most prosperous art schools in the kingdom, and by this success of the classes the institution has for some years been maintained. For over a quarter of a century I have acted as hon. secretary, so that my knowledge of the difficulties in keeping this most valuable collection together is of long standing. We have recently been enabled to erect more studios in extension of the premises and it is desired to augment the mediæval specimens with more examples of Classic work as well as of Renaissance design, so as to bring the collection more in line with the requirements of the day by making it more comprehensive and complete. As an assurance of the practical character of this endeavour to render the museum more efficient and up to date, I may mention that among the vice-presidents Messrs. Aston Webb, A.R.A., John Belcher, A.R.A., G. F. Bodley, A.R.A. and George Frampton, A.R.A., have been elected this season, while the presidential chair, vacated by the death of the Duke of Westminster, has been filled by the election of the President of the Royal Institute of British Architects, Mr. William Emerson."

A.A. Papers. THE following is the list of papers to be read before the Architectural Association during the coming session:—Oct. 5.—Annual General Meeting. President's address and distribution of prizes by W. Howard Seth-Smith, F.R.I.B.A. Oct. 26.—"French and English Cathedrals" (illustrated by lantern views), by Francis Bond, M.A., Hon. A.R.I.B.A. Nov. 9.—"The Legal Position of the Architect," by L. L. Macassey. Nov. 23.—"The Use of Rolled Joists in Construction," by A. T. Walmisley, Hon. A.R.I.B.A. (The members of the Institution of Junior Engineers have been invited to attend this meeting.) Dec. 7.—"Colour in Architecture seen through an Artist's Glasses," by A. Wallace Rimington. 1901.—Jan. 4.—"Hints on the Preparation of Studentship Drawings," by Beresford Pite, F.R.I.B.A., and R. Weir Schultz. Jan. 18.—"Flats," by Edwin T. Hall, F.R.I.B.A. Feb. 1.—"Cretan Architecture," by D. T. Fyfe. Feb. 15.—"Gothic Architecture and the Basis of its Beauty," by E. S. Prior. March 1.—"The Paris Exhibition, 1900," by E. W. M. Wonnacott, A.R.I.B.A. March 15.—"Rowton Houses," by H. B. Measures. March 29.—"Small Suburban Houses." by H. D. Searles-Wood, F.R.I.B.A., and H. R. Appelbee. April 19.—Subject to be announced. May 10.—Subject to be announced.

The Théâtre Français. THE masons have finished their work in connection with the rebuilding of the Théâtre Français in Paris, which is now in the hands of the carpenters, joiners, painters and upholsterers, so that the reopening by the Comédie Française is not very far distant. As the outer walls of the building were little damaged by the fire, the exterior plan, designed by the architect Louis, about 1780, has practically undergone no modifications. The interior aspect and arrangement of the theatre have also been as far as possible preserved. Thus the oval-shaped vestibule on the ground floor remains unchanged. Considerable difficulties have been overcome in preserving the general design of the room and of the low roof supported on columns, as the latter had been seriously weakened by the ceiling yielding under the weight of the streams of water thrown on to extinguish the fire in the foyer. The grand staircase, likewise, will be restored exactly as it was. The stage has been entirely rebuilt, in exactly the same size as that of the old theatre, but it affords much greater depth below the boards, and far more extensive accommodation for the storage and shifting of scenery. Of course, full arrangements have been made for the efficient working of the fireproof curtain. A wide passage runs from the middle of the stalls and through the ground-floor tier of boxes, a very satisfactory improvement for the convenience and safety of the public. The change, however, has not met with universal approval.

New Patents.

These patents are open to opposition until October 15th.

1899.—Window Sashes Without Weights.—13,764. R. L. WILLIAMS and T. PAYNE, Smithfield Engineering Works, George Street, Chester. At each side a screwed rod (which can be revolved by means of a cord) is fixed inside the window frame and on these rods work nuts attached to the sashes.

Spring Roller Blinds.—16,607. S. SMITH, 16 Higher Chatham Street, Chorlton-on-Medlock. Instead of being attached to the centre of the blind, the cord is fixed at the side to a pulley on the end of the roller. It is so fastened that when it is unwound the blind is lowered, the spring drawing it up when required. The advantages claimed are that only one hand is needed to operate the blind, that there is no liability to upset or disturb centre ornaments, and that the blind is more adapted for use in show windows.

Paving Materials.—19,353. C. J. R. LE MESURIER, Blewbury, Didcot. The material consists essentially of moss litter compounded under pressure with bituminous, resinous, elastic or other cementing substance, with or without the addition of brick dust, sand, &c. Moss litter is the material that usually covers the deposits of peat.

Earthenware Sinks.—20,271. B. ROBINSON, Church Gresley, Derbyshire. This invention enables earthenware sinks to be made by a continuous process, like bricks. It consists of a continuously or intermittently feeding clay-machine having a distributing centre with a device for forming the sink. This device comprises a die with a movable centre, a moving sliding-face plate (which forms the sides in turn), balance weights, &c.

The following specifications were published on Saturday last, and are open to opposition until October 22nd. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—16,304, LANDMANN AND REIF, apparatus for drying, impregnating, and moulding plastic materials 16 921, FITCHEW, keyhole saw. 16,981, HENDERSON AND BROWN, preservative composition for coating wood, metal, &c. 17,083, WILKIE AND BEAMAN AND DEAS, LIMITED, destructor furnaces. 17 205, WESSBECHER, joints or connections for uniting parts of furniture. 17,764, THOMPSON (*Hutchinson and Wright*), combined separable squares, try-square and bevel. 17,866, DAUBACH, roofing. 19,402, TAYLOR, domestic fireplaces and hearths. 19,665, BAYLIFF, BAYLIFF AND DRAPER, couplings or joints for rods, shafting, &c. 20,470, MARTIN, water-waste preventers. 20,478, ROWLEY, manufacture of earthenware flushing cisterns. 20,544, BOWMAN, electric bell. 20,557, WHITHAM, machines for grinding or reducing lime, ashes, sandstone, &c. 20,604, RICHMOND, gas-heated water heaters. 20,723, DOYLE, bolts or fastenings for doors, windows, &c. 20,809, MACDONALD, filter presses and moulding presses. 21 196, MITCHELL, means for fixing brush heads to their handles.

1900.—90, HUPERTZ AND BREIDENBACH, roofing tiles and their manufacture. 3,783, CONDULA, grinding, crushing, mixing and kneading rollers. 4,166, ENGELS, process for the production of fire- and acid-proof materials and coatings. 5,755, JUNG, BRECHER AND KITTEL, manufacture of electrical insulating material. 7,106, MURPHY, electric railways on a surface-contact system. 9,897, GAVITT AND TUCKER, hooks. 11,026, LUNDBERG AND LUNDBERG, cord grips for electric-light fittings. 11,432, TREIBERT, attachment to kitchen ranges. 12,034, LEIGH (*McCartney*), water-heating, distilling and sterilising apparatus. 12 314, MOTLEY, combination shovel and sieve. 12,605, RUSSELL, apparatus for heating buildings by the circulation of steam or vapour. 12,688, O'BRIEN (*Soc. Anon. Française des Becs Juhle*), tap or valve. 12,859, LAKE (*Jewell Export Filter Co.*), purification of water.

Masters and Men.

The Strike of Labourers at the Bridge Engineering and Shipbuilding Works, Chepstow, which had lasted nine weeks, collapsed last week, owing to the men failing to receive continued support from the National Amalgamated Labourers' Union. New hands have displaced most of the strikers.

The Blackpool Painters' Strike, which commenced in April, still continues. At present, the masters are able to get through the very small amount of work now requiring attention by the employment of imported labour. The workers say they have now between thirty and forty men on their books.

Withholding Trade Union Funds.—William Lynch, treasurer of the Leeds branch of the Amalgamated Bricklayers' Labourers' Union, was charged last week with withholding £117 belonging to the union. The moneys were received by Lynch chiefly as members' subscriptions. The defendant admitted that about £25 was due to the union, and Mr. Willey, for the defence, said the defendant was a bricklayer's labourer with a little over a pound a week, and what he did in connection with the union he did in his spare time. The stipendiary magistrate fined the defendant £5, and made an order for the payment of £50.

The Peterhead Master Builders' Association, at its annual meeting, appointed the following office-bearers for the ensuing year:—President, Mr. Alex. Webster, builder; vice-president, Mr. Alex. Milne, engineer; committee—Messrs. West, builder; Simpson, slater; Ferguson, painter; Sutherland, blacksmith; and Scott, builder. Mr. A. Clark Martin, solicitor, was reappointed secretary and treasurer. The following were appointed delegates to the annual meeting of the Scottish Building Trades Federation, to be held in Edinburgh in October:—Messrs. William Stuart (member of the executive of the Federation); Dickie, joiner; and Hadden, builder.

The Strike of Edinburgh and District Masons still continues. The masters gave the men notice on April 5th of a reduction of wages from 9½d. to 8½d. per hour, to come into force in two months, and intimated that the agreement in the future would be one of three months instead of twelve months, as formerly. The joint committees of the men's three lodges met, and decided to hold a conference with the masters; but (as the operatives' officials say) these committees had no authority from a general meeting of the men to take any step. A conference was held, with the result that the employers offered 9d. per hour and a twelve months' agreement. The men rejected the proposals of the masters. The representatives of the Associated Masters say that, with the exception of Messrs. William Turner and Sons, Torphichen Street, who yielded to the men at the very beginning of the strike, really none of the seventy members of the Masters' Association of any importance have given in. The operatives' secretary reports "no change." There are at present, he states, about 600 men who came out on strike in Edinburgh and district who are working with employers who have conceded the men's terms. Altogether 2,200 men came out, and there remain a little over 900 still on the roll. The representative of the operatives states that of the associated masters four or five have yielded to the men, and between them have taken back 163 men.

A new Church at Bryn, Port Talbot, is being erected. The building, which is designed by Mr. Frank B. Smith, architect, of Aberavon, will accommodate 350 persons. The church is of the Lancet period, and will be built of stone, lined with red bricks inside, with white stone mouldings and joints. The roof will be covered with J. C. Edwards's Ruabon red tiles, and all woodwork will be pitch pine. The total cost of the building, including furnishing, will be £3,000. The contractors are Messrs. Lattey and Company, of Allen's Bank Works, Cardiff.

Surveying and Sanitary Notes.

A new Park at Leeds, called Burley Park, was opened on Saturday.

Town Hall Square Scheme at Newcastle.—Discussion over the site for new town-hall and municipal buildings at Newcastle is, it appears, again to be revived. Mr. Guy Wilfrid Hayler suggests that the present Town Hall should be pulled down, and that the area which it occupies should be used with the Cloth and Groat Markets to form a great municipal square. This scheme is attracting considerable attention.

Peterborough House and Grounds, Fulham.—There seems no possibility of the estate of Peterborough House and grounds, Fulham, being procured as an open space except by Act of Parliament, as the late freeholder directed in his will that the land was to be let to secure freehold ground rents.

A St. Luke's Improvement.—The St. Luke's Vestry have decided to give a contribution of £265 towards an improvement suggested by the London County Council at the junction of City Road and Old Street, fronting the new Electric Railway station. The total cost of the setting back will be £1,050, and the Shoreditch Vestry and the London County Council will share the balance.

The Strand Improvement Scheme.—The new roadway which takes the place of the old houses that stood on the north side of the Strand between St. Clement Danes' Church and St. Mary's Church has been opened for traffic, with a new wide pavement for pedestrians on the north side. This part of the Strand will now be over 60ft. wide, or exactly double the old width. In the centre of the roadway not yet finished will be two refuges for crossing purposes. For the present the houses on the south side of Holywell Street will be allowed to stand, but they will be demolished shortly when the leases expire.

Examinations in Sanitary Knowledge will be held next year by the Sanitary Institute at the places stated on the following dates:—*In Practical Sanitary Science and for Inspectors of Nuisances* (under the Public Health Act, 1875): Bristol, January 25th and 26th; Edinburgh, March 8th and 9th; Birmingham, March 22nd and 23rd; London, April 26th and 27th; Dublin, June 7th and 8th; Bradford, June 28th and 29th; Liverpool, July 12th and 13th; Cardiff, July 26th and 27th; Norwich, November 1st and 2nd; Newcastle, November 15th and 16th; London, November 29th and 30th; Manchester, December 20th and 21st. *For Inspectors of Meat and Other Foods*: Birmingham, March 29th and 30th; London, May 3rd and 4th; Liverpool, July 19th and 20th; London, December 6th and 7th. *In Practical Hygiene for School Teachers*: London, February 8th and 9th; Bradford, June 28th and 29th. *For Sanitary Inspectors* (under the Public Health, London, Act, 1891): London, January 15th to 19th. Further particulars of these examinations can be obtained on application at the Offices of the Institute, 72 Margaret Street, London, W.

Manchester Sewage Disposal.—At a meeting of the Manchester City Council last week Alderman Sir B. Leech moved the adoption of the proceedings of the Rivers Committee, which included the plans and estimates of two schemes for the better treatment of the sewage of the city, one based on the recommendations of experts engaged by the Corporation and the other framed to meet the requirements of the Local Government Board. Both schemes were based upon bacterial treatment, but the Government scheme involved much the larger acreage for filter beds. He said the committee asked the members of the Council to forget past differences and adopt a course that would best serve the interests of the city. The Council ought to take prompt steps, or they must expect further action by the Mersey and Irwell Joint Committee and largely-increased penalties. The pecuniary loss might be serious, but still more serious was the

stigma attached to the city as being more backward than almost any other in the kingdom in dealing with its sewage. Manchester has spent £223,000 already in works of sewage purification; that amounted to two-thirds of a penny in the pound on the rates. The Local Government Board asked the Corporation to spend £487,000, which would mean an annual addition to the rates of 1½d. in the pound. That would bring up the outlay to slightly over 2d. in the pound. The Rivers Committee did not recommend either of the schemes before the Council. The difference between the two schemes was, therefore, not likely to exceed ½d. in the pound in the rates, and it became a question for the Council to decide if they would go to that extra cost and so provide for the future expansion of the city and secure the goodwill and approval of the Local Government Board.—The Government scheme was adopted, and a resolution was passed to apply for the sanction of the Local Government Board to the borrowing of the £487,000 necessary.

Correspondence.

Building at Cape Town: A Warning.

To the Editor of THE BUILDERS' JOURNAL.

CAPE TOWN.

SIR,—On my recent visit to your country I noticed that enquiries were constantly being made concerning the building business here. As one who has experience of South Africa, and Cape Town in particular, as a public official in the building trades, a few remarks of mine may prove useful.

Cape Town is crowded with a lot of idle persons, many of whom (I had this from the Mayor) are at their wits' end to know what to do for food; some were even said to be living on one meal a day. There is about as much building now going on as before the war, but nothing like enough for the crowds here to do it. Amongst architects draughtsmen are in excess of the demand and numbers of them who came from Johannesburg ten months ago are still here. A few architects seem to be doing something, but many are complaining of the want of remunerative business. Shop-owners have done well during the war, but naturally they form only a moderate percentage of the people. Sir Alfred Milner recently informed a deputation that they (refugees) might have to wait two months before they could be allowed to return to Johannesburg. Several of these people have informed me that they regard this answer as simply diplomatic and that it may be twice that time before they are allowed to return to their homes. I have met several well-established builders who have informed me that they are doing practically nothing. Though rents are high, there is not very much new house building, as owners expect a large exodus on the proclamation of peace, which, however, will throw back on the labour market large numbers of colonial troops, many of whom have previously been engaged in the building trade. Lodgings are very difficult to get owing to the glut, and billets still harder: the civic authorities appear to have great anxiety on this latter account because of the number of the unemployed. The Public Works Department informed me that they had got rid of every possible man, and stopped practically all new building work for at least twelve months to come, as the estimates just now passing Parliament provide for none. A small amount of railway and irrigation work is projected for the next twelve months, but this class of work is mostly done by natives, very little skilled labour being needed, excepting for supervision.

So that, on account of these things, it is to be hoped that intending emigrants in any line will be wise enough to postpone their departure till a considerable time after the proclamation of peace—at any rate till it is clearly seen what move in a prosperous direction South Africa will be likely to take. It is most unwise of newcomers, unused to the country, to come at all at present unless furnished with about twelvemonth's supply of funds.—Yours truly,

EDWARD H. WAUGH.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

BOURNEMOUTH.

SIR,—The only thing to be commended in the letter of your correspondent "Untrammelled" (published on page 67 of your issue for August 29th) is the choice of his *nom-de-plume*, for remarks more "untrammelled" by logical reasoning it would be difficult to imagine. I fail to understand how helping "in draughtsmanship" is not helping "in building" in proportion to one's position, whether as a despised "assistant" or equally so "architect." Though naturally a good deal of an assistant's work is mere reproduction, yet how often are buildings now erected which are the outcome of the head assistant's brain as much as the principal's. But, granting that assistants are mechanical machines for the preparation of drawings, how would matters be improved from an artistic standpoint if we turned masons, &c., as suggested by "Untrammelled?" For, as all could not immediately become master builders, any more than they can become practising architects at present, we should be dressing stones or working timber in individual sections, instead of drawing, and to a great extent working out, the details of an entire building.

Yours truly,

LINEAR.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, E.C.

SIR,—I have followed with great interest the correspondence in your columns relating to the question of assistants' salaries, and I most cordially agree with the very candid and outspoken views of "Untrammelled." During my long experience in the profession, I have found few architects that have really been artists in the true sense of the word. The fact of the matter is, as I have before urged, that youths are placed in the profession who are totally unfitted for it—young men who have neither artistic nor constructional talent, whose parents are frequently rich tradesmen or poor gentlemen who apparently think that an architect can be "made," that is, turned out in the same commercial manner as a drapery warehouseman or a "dry goods merchant." It is the prevailing idea of many parents that by articling them to architects their sons will belong to a genteel profession without the great expense that would be entailed by placing them in any of the regularly-acknowledged professions; for, thanks to the exertions of the Royal Institute, the "profession of architecture" has no legal status, and is not half so much respected by the public as that of, say, the chartered accountants. Hence it is that there are so many priggish young assistants who look down upon respectable craftsmen and artisans with the greatest contempt—workmen are "quite too horrid, you know." It is because the architectural labour market is flooded with inefficient assistants that salaries are so poor, and inasmuch as each assistant can only be worth what his individual talent may be valued at, it would be impossible to have (as some of your correspondents have suggested) grades or classes with fixed payments for each.

Again, there is now not much hope for unknown men in the profession, however clever they may be, in the matter of important competitions. The Institute arrogates to itself the nomination of competitors for public works—*vide* the cases of the new street from Holborn to the Strand and the City Sessions House competition; so that unless an architect is one of the elect, or is a friend of one of the elect, his chance is *nil*.

Let parents ponder, then, before they place their charges (both male and female now) in such a very heart-breaking profession.

Yours truly,

H. T. B.

To the Editor of THE BUILDERS' JOURNAL.

BIRMINGHAM.

SIR,—Having read the letter of "Untrammelled" in your issue for August 29th, I notice that several of his remarks are not consistent with facts. He starts by stating that architects are badly paid, and consequently their assistants. This he attributes to the lack of interest shown by the educated public in architecture, as being due to the fact that the works of the Italian Renaissance and all that followed were insincere or copied, and therefore lacking in architectural interest. Does "Untrammelled," then, in this assertion include such buildings as St. Paul's Cathedral and a great many others over the country which never fail to arouse admiration and interest in the most refined and artistic minds?

Further on he says: "The producer of architecture in the past was always the builder, always the master-workman, an artist-tradesman. And the architects' assistants are part of the pernicious system now in vogue." I believe the first of these statements is to some extent correct, but the condition of modern requirements now calls for a different state of things. For instance, in the past time was often a matter of secondary importance as far as building was concerned, and the architect could easily combine the duties of architect and builder; but any practical person knows that, right or wrong, such a system is now impossible. With regard to what he terms "the pernicious system now in vogue" it is hard to find on what grounds he calls it such. It appears to me to be the natural development of architectural practice necessary to meet the requirements of the age.

Then he says: "Again, compare the large payments received by our painters and sculptors, men whose works are of interest, with the miserable payments made to those attempting to produce architecture." I may point out that there are many who not only attempt to produce, but actually produce, architecture which is both useful and artistic, and who, judging from their success in life, have no reason to complain of being ill-paid or unappreciated; and I may say, as a rule, that architects are paid quite fairly for the amount of work which it is their fortune to undertake. Besides, all painters and sculptors are not in the happy position of "receiving large payments"; on the contrary, many clever men and good artists are doomed to disappointment and obscurity.

With regard to the condition of architects' assistants, it is apparent that there are many men who from inadaptability or other causes are not worthy of good salaries, and it would certainly be no great evil if such would, as "Untrammelled" suggests, "be driven to take up some craft and work at it" more in accordance with their natural abilities; but as to their becoming "actual builders," as he thinks they might, such a course is completely out of the question.

Yours truly,

W. E. C.

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—After fourteen years' pupilage and thirty years' practice I venture to give an opinion on this subject. The value of an architect's assistant depends, like other labour, on supply and demand, and as an architect's assistant means draughtsmanship only in most cases the supply is now kept up from our Board Schools beyond the demand; hence the slump in the market. The cause of the whole of the trouble in the architectural profession arises from the want of business tact in the Royal Institute. The members of this institution have been improperly trained for the profession and they continue on the same lines which have failed for the past three hundred years at least.

We hear a great deal of talk about ancient architects, but we never hear of the Royal Institute acting up to our ancient architects' principles of training. Would it not be better if Freemasonry were swept away and real masonry substituted: and who is more capable of effecting this change than the Royal Institute? The present examination of the Institute, I am quite satisfied, is only a coached-up affair, like the examination for the Army, which fact the nation is now learning to its cost. There is more architectural ability in many an old country carpenter than is to be found in half the members of the Royal Institute of British Architects. Every member of the S.A

ought to be killed on sight. We must look to the joiner's "Bench" and the mason's "Banker" for our future architects.—Yours truly, PEN.

LONDON, W.

SIR,—As a student I naturally feel interested in your discussion. Surely the real cause of the trouble is that as a class we do not know our own business.

The budding architect must first beat the office boy off his own bat; then the tracer; pick up the element of surveying; attend classes in building construction by an eminently unpractical expert; and become a ready sketcher without tuition or encouragement. What wonder that we fall into the hands of the Wholesale Purveyor of Architecture, bound to do his bidding or to supply the occasional want of the surveyor and engineer. Incapability will cease when the responsibility of the pupils (mostly shirked by the master) is taken out of their palm, and a college established on practical foundations, controlled by an institute not too Royal, with a not too impossible charter. —Yours truly, S.R.I.B.A.

ILE L'OUESSANT, FINISTÈRE.

SIR,—"Reform," in your issue for August 8th, takes exception to "An Art Worker's" "effrontery" in speaking of architects' assistants in one breath with "ordinary clerks in business establishments." This may be right, but, if so, "Reform" has got hold of quite the wrong end of the stick. The fact is that, as young fellows, architects' assistants have such a wretched training that they are as a rule simply a drug in the market, either in an architect's office or in an office of any other kind. —Yours truly, AN ART WORKER.

Bricklaying.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.W.

SIR,—The trade is much interested in the vexed question of how many bricks can—or rather should—a bricklayer honestly lay on ordinary work per day of nine working hours. Ordinary work may be taken as that done on workhouses, infirmaries or warehouses where all is specified to be built in stock bricks, picked facings outside, and (for the two first-named classes of buildings) plastering inside—struck joints on the inside for the last-mentioned class; usual window and door openings, walls 2½ bricks thick at the top of footings to 1½ bricks at the roof; a few courses of red bricks at different levels. But it is of course taken for granted that when dealing with the matter good solid work only—not jerry-building or field ranging—is referred to. Your correspondent "An Honest Bricklayer" says that it is impossible to lay more than 500 or 600 bricks a day on an 18in. wall which has no plumbing places and can be worked entirely with a line. If this is correct he surely cannot honestly lay claim to his *nom-de-plume*. A rod of brickwork costs for labour only, bricklayer and labourer, £4 19s. p.c., to which must be added the cost of scaffolding Taking the mean of 550, this is nominally a brick per minute of the working time. Therefore, what must be the cost of a wall with openings like those in the buildings mentioned above? A clerk of works stated to me that 40,000 bricks were laid by four bricklayers in four days in the base of a chimney shaft 12ft. square; this took place during the past spring in London, and means 2,250 per man per day. What of this? It is at the rate of 4⅙ bricks per minute for the four days. Were these four bricklayers "honest," or what?

Yours truly,
SYLAS SYNTAX

Courts and Courtyards.

To the Editor of THE BUILDERS' JOURNAL.

NEWCASTLE-ON-TYNE.

SIR,—The editorial notes on the above subject in your issue for August 29th are both welcome and opportune. It seems to me that unless some interest can be revived we shall soon have courtyards as extinct in this country as the proverbial dodo. Large mansions, large hotels and large colleges—in many of which a courtyard might be appropriately introduced—are all being built without this beautiful and serviceable architectural feature. To wander in the "quads" at Oxford is to realise what a courtyard is. You come in from the thoroughfare to a kind of calm seclusion, appreciably accentuated by the wide open space and the boundaries of weather-beaten stone walls on which mediæval art has left her indelible charm. You seem in a few steps to have left the restless world quite behind. The monk of old must have thoroughly understood the value of an open space, otherwise he would never have designed the cloisters. And what a delightful legacy to leave to posterity—why, in the whole of London I know of no place which seems so much a haven of rest as the cloisters at the Abbey; the Little Cloister, with its tiny fountain, is very impressive.

Very often I have stayed at a quaint old-fashioned inn in an out-of-the-way "town" in Berkshire (we English are in need of a word for a place which is not quite a town, yet is more than a village), and the little courtyard was one of its chief features. It had strange stairs outside leading up to the bedrooms, so that one's retirement at night was an event, especially if it was windy.

To surround his house and grounds with a very high and a very thick stone wall is said to be a trait of the Englishman, yet it seems to me that if he desires seclusion he could get it in a much better way by arranging his buildings so as to form a courtyard. He would then have a place which would be pleasant at all seasons, whilst in summer the shade of the buildings would afford a cool retreat. Let us hope he will seriously think it over.—Yours truly,

GUY WILFRID HAYLER.

THE BRITISH ASSOCIATION.

THE second Bradford meeting of the British Association was begun last Wednesday, being opened with an address by the president, Sir William Turner. On Thursday meetings were begun of the various sections of the Association. In the Mechanical Science section Mr. James Watson, M.I.C.E., read a paper on "Water Supply, with a description of

The Bradford Waterworks

Old and New." He said:—Three consecutive dry years give about 80 per cent. of the mean annual fall, and this is generally adopted as the basis of calculation in questions of water supply. Percolation is the source of all springs and of all well-water supplies, so that temperature, prevailing winds, physical features and geological formation all demand investigation. In gravitation works having large impounding reservoirs set among the hills, or in upland districts, rapid altitudes, absence of plant and vegetable life, and impermeable geological formation, are ruling desiderata, while in pumping schemes the converse holds good; porous or permeable formations become both filtering beds and reservoirs. Gravitation works in first cost are more expensive than pumping works, but the working expenses of the latter are much larger. Gravitation works, such as those of Bradford, entail the consideration of and provision for rights and interests generally unknown in pumping works, one important item being known as the "riparian owners' water rights," usually called "compensation water." Parliamentary Committees, dealing with private Bill legislation, invariably adhere to the unwritten law that of the total available rainfall yield, two-thirds to the Waterworks Undertakers for the use of the town, and one-third to the stream for the riparian owners' supply. The available yield of the appropriated gathering ground, or drainage area, is arrived at by taking the annual mean rainfall of three consecutive dry years, deducting therefrom one-fifth, plus the loss due to evaporation and percolation. The county landowner by this arrangement has his interests not only protected, but made more valuable. The proper distribution of a water supply under constant service to a large and increasing population for domestic and manufacturing purposes demands many considerations, such as the proper proportioning of each main and service main (both as to material, thickness and diameter), forming what is really a great complex network of pipes spread over an area or areas many square miles in extent, working under conditions constantly changing. The early tentative and private experiments in the supply of water to Bradford were next described by the author. The population of the city of Bradford is now 300,000, and, in addition to supplying Bradford, the Corporation supply twenty-four towns and places outside the city boundary, but within the Parliamentary area of supply. The out-towns have a population of 150,000, so that the aggregate population now supplied is 450,000. The average daily consumption is 12,000,000 gallons, or about 26½gals. per head per day for all purposes—domestic, public health and trade. The consumption within the city, calculated on the population previous to the city extension of last year, was 41gals. per head per day for all purposes, but of this quantity no less than 21¾gals. per head per day was sold through meter for trade purposes. The consumption under constant service has for years exceeded the supply, and recourse to short or intermittent service during the summer months has been frequent.

The Physical Configuration

of Bradford and its out-towns and the extreme range in height (supply being given by gravitation in three zones, viz, the low, middle and high levels) within the area of supply, which runs from 200ft. above the sea at Appeley Bridge to 1,240ft. above sea level at Queensbury, or a difference of 1,040ft, makes supply and proper distribution matters of considerable difficulty. The low-level supply comes from the Barden Moors in the valleys of the rivers Aire and Wharfe; the middle level from Manywells Springs, near Wilsden; and the high level from the high moors above Denholme, in the valleys of the Denholme Beck and River Worth, both tributaries of the River Aire. The storage capacity of the impounding and service reservoirs, thirteen in number, is 1,784 million gallons. The drainage area to the compensation reservoirs is 12,020 acres, and the storage capacity of six compensation reservoirs is 1,292 million gallons

Mr. John McTaggart, A.M.Inst.M.E., Superintendent of the Cleansing Department of the Bradford Corporation, read a paper on

"The Disposal of House Refuse

in Bradford." He said:—The disposal of house refuse is a problem which has occupied the attention of many cities and towns, and to none has the solution been more difficult than to the city of Bradford. Early in 1880 the first destructor of six cells was erected at Hammerton Street by Messrs. Manlove, Alliot and Co. Subsequently the number of cells was doubled at this place, and these were followed by the erection of a destructor at Southfield Lane in 1883, the Sunbridge Road destructor, and the Cliffe Road destructor, 1891, the total number of cells then being thirty-five, capable of destroying at that time 250 tons of house refuse per day, or nearly the whole of the refuse collected at that time. The whole of these destructors have been kept at work ever since. In 1897 the twelve cells at Hammerton Street were rebuilt under the "Horsfall" Patents, and early in the present year the contract for the rebuilding of the Southfield Lane destructor was placed in the hands of the same company. The total quantity of refuse collected amounts to 125,000 loads per annum, from 32,164 ashpits, to which 180,000 visits are paid during that time, giving an average of 3·87 loads per ashpit, and 5·6 visits per year. At the present time about 90,000 loads are destroyed annually at our destructors, the remainder being either tipped in the out districts or sold to farmers. The latter method of disposal is becoming extremely difficult in Bradford owing to our being somewhat removed from the agricultural districts. Tenders have been invited for the erection of five additional refuse destructors in various parts of the city, capable of destroying altogether 180 tons per day, and it is the intention of the cleansing committee to push on this work as rapidly as possible, so that we may be able to destroy the whole of the refuse collected in the city during the next year. In the specification for these new destructors

the Cleansing Committee have aimed at a well-considered scheme which embraces the following objects :—

1. The least possible handling of the refuse after being tipped at the destructor, the total abolition of the customary "pit" and of the employment of chargers being aimed at.

2. The design of furnace which is calculated to give the highest destroying efficiency, taking into consideration the cost of working and repairs.

3. The scheme which is calculated to give the highest evaporative efficiency, bearing in mind the fact that the destruction of refuse without nuisance is the first consideration.

4. The scheme which has for its object the lessening of the labour and preventing nuisance, consequent upon frequent "clinkering," and for the automatic removal or conveying of clinker, and the cooling of the same will receive the most favourable consideration of the committee.

At the present time the total number of cells in Bradford is as follows:—Working, 29; rebuilding, 5; to be erected, 18; total, 53. These, when complete, will have a total destroying capacity of 145,000 loads per annum.

Disposal of Clinker.

Until 1894 it cost the Corporation of Bradford over £1,000 per annum to cart the clinker to tips. Since that time, however, we have been very successful in our efforts to utilise in various ways the large amount of clinker we produce. Additional mortar mills have been erected; clinker crushing and screening machinery has also been introduced, with the result that at two of our destructors, Hammerton Street and Cliffe Road, we sell the whole of the clinker produced. At Sunbridge Road we dispose of one-half at the present time, and at Southfield Lane machinery is being installed to utilise the whole production. At the present time we have eight mortar mills at work, and we are turning out mortar at the rate of 12,000 tons per annum. We produce the screened clinker in four sizes, and the uses to which it is put are many and varied. It has been extensively used for

Concrete Work

in connection with the recent tramways extensions in Bradford; at the electric power station extensions in foundations and engine beds; and in the sewage and street cleansing departments; while the finest, or No. 4 size, is eagerly purchased by plasterers, and takes the place of river sand. Another method of profitably utilising this residuum is in the manufacture of artificial stone. We have lately installed at our Hammerton Street Works a complete hydraulic plant for this work, comprising a powerful hydraulic press, working at a pressure of two tons per square inch. In conjunction with this press are two sets of moulds, which enable us to keep the press working continuously, one mould being under pressure while the other is being filled. The machine is capable of producing 200 slabs per day of 9½ hours. The slabs are made in a variety of ways—some with a facing of granite chippings and Portland cement, ¾in. thick, in the proportion of 3 to 1, the remainder of the slab, which is 2½in. thick altogether, being composed of clinker and cement in the same proportion. The slabs are also made from clinker and cement alone; these slabs can be produced much cheaper, and are very suitable for side streets, backyards, and cellaring. Some of the neatest and best slabs we have yet manufactured are composed of bluestone chippings and cement in the proportion of 3 to 1. As these can be sold at the same price as granite-faced slabs, they are likely to become very popular. The price fixed for these slabs is 3s. 2d. per square yard, but I am anticipating being able to recommend to my committee to still further reduce this price at an early date. Still another, and perhaps the most profitable, way of utilising clinker, especially when large quantities have to be dealt with, is in the manufacture of

Concrete Bricks.

The results have been so satisfactory that it is intended to lay down one or more plants at some of our new destructors. These bricks are eminently suitable for any class of inside walling. These bricks, when made from a 10 per cent. mixture of hydraulic lime and clinker, and properly seasoned, are nearly 50 per cent. stronger than the ordinary building brick used in Bradford, and they can be manufactured at a cost of 14s. per 1,000. For utilising large quantities of clinker in districts where its sale in other forms is limited there can be no better method, the product always being in demand, and a small machine turning out 8,000 bricks per day will require over 20 tons of clinker for that purpose. Samples of these bricks were tested by our Technical College staff, and the results show that they should be kept at least three months before using, if they are naturally dried, the increase of strength during the last four weeks being remarkable. Clinker can also be used for manufacturing ornamental tiles. Special and inexpensive machinery has been designed for this work, by the use of which one man is capable of producing 750 encaustic tiles, or from 3,000 to 4,000 plain tiles, per day, each tile being subjected to a pressure of sixty tons. There is always a good demand for ornamental tiles, and these can be manufactured at a very handsome profit.

The Silchester Excavations.

In the Anthropological Section a report was read of the committee, consisting of Mr. A. J. Evans (chairman), Mr. J. L. Myres (secretary), and Mr. E. W. Brabrooke, appointed to co-operate with the Silchester Excavation Fund Committee. The excavations, which had been completed in the south-west quarter of the town in 1898, were continued in the northern half of the site in 1899 from May to November. As usual, a number of wells were met with in the course of the work, lined with wooden framing towards the bottom. No architectural remains of any importance were met with, save a piece of coping, part of a fluted Purbeck marble pilaster, and a fragment of a white marble slab. The finds in bronze, iron, glass and bone were as numerous as usual, but do not call for notice. From the pits examined an exceptionally large number of entire vessels of pottery were recovered, the total being about eighty. They include several pseudo-Samian vases of unusual quality, an inscribed drinking cup of Castor ware, some large vessels of the coarse ware which is so seldom found entire, &c. The coins found were not very numerous.

The Timber Supply of Great Britain.

In the Botany section Mr. Samuel Margerison read a paper on "British Sylviculture," of which the following is a summary :—

The old insular idea that there is no timber on earth equal to British oak has had to be considerably modified since the introduction of foreign timbers in large quantities. Among the hundreds of imported varieties it only needs to mention teak, greenheart, pitch pine and fir to show that our own supplies would long ago have proved inadequate to the demand, both in quantity and quality, had we been solely dependent on home production. Yet we cannot afford to ignore the fact that we still need large quantities of native wood. Notwithstanding the substitution to a large extent of iron for wood in construction more timber is used than ever, and in the opinion of experts the available supply of the latter is so much reduced that we are "within measurable distance" of a timber famine. Doubtless, the world has immense areas of almost untouched forests, but the present cost of transport is prohibitive of their use here, and, besides, the requirements of other countries are increasing, and much of this supply will be wanted at home. In view of these vital facts it is shortsighted and improvident of us to neglect our own sources of supply.

Of course something is being done by a few persons to provide for future requirements, but it is a trifle in comparison with what ought to be done. Not hundreds of acres, but hundreds of thousands ought to be planted. We have much land, both in hilly and lowland districts, which is at present wholly or partially unproductive, a great part of which could be profitably utilised for sylviculture, and it behoves us to use some of it in this way. There is enough of it to make us nearly independent of foreign supplies of the most generally used timbers, which we import to the value of nearly £20,000,000 per annum.

It seems to many that, as this question of the supply of timber is even more a national than a personal one, it might be taken up by

A Government Department

in such a manner that private owners would be secured against loss, whilst the nation would ultimately benefit largely. It may also be incidentally mentioned that the cultivation of a large area of forest would be another means of keeping the labourers from crowding into the large towns as they are doing.

When we compare the results obtained from the forests of the Continent (especially the forests of Germany) with those of our own country we cannot fail to see that some change is necessary. We find in Germany, for instance, beech forests with 9,000 cubic feet and fir with 12,000 to 15,000 cubic feet to the acre. Contrast these with our crops of 2,000 to 3,000 cubic feet. The German forester plants thickly to induce lengthy, straight, and clean growth; he preserves a good overhead canopy to modify direct evaporation from the soil; and, later, thins gradually to encourage thickness of stem. He has systematic "rotations" of a certain number of years for cutting, according to the nature of the crop, its environment and rate of growth. Sport is secondary to sylviculture, although sport is abundant. And, where advisable, he has the advantage of secured Government loans at reasonable interest, together with what is perhaps the most important thing of all, Government supervision. There are also large areas of forest belonging to the State and to other Corporations. Schools of Forestry, with equipments worthy of the importance of their object, are also provided in order to give scientific and practical training to those who have charge of the forests, and the result of this care is that crops of three or four times the bulk of ours are gained from the timbered areas.

In the

Sylviculture Proper,

the greatest gain would come from the systematic methods of growing timber, the crops not being subject, as they are at present, to being wasted in consequence of the caprice or necessity of individuals. The great principles would be thoroughly worked on of making sport secondary to timber growing (most especially by keeping down rabbits, and by not allowing the convenience of King Pheasant to interfere with the proper working of the woods); thick planting; preservation of overhead canopy; judicious thinning, and the suppression of the host of forest enemies, insect, vegetable and other. In a few years current expenses would be met by the sale of the early thinnings and sporting rents, and the later crops would be utilised by the repayment of the loans, meeting death duties, &c.

Having produced a stock of timber, it is necessary to place it where it is useful, and so the

Questions of Handling, Transport and Conversion

come in. The question of handling and transport is a vital one. It is no less so in relation to native timber. In fact, under present circumstances (circumstances which might be modified) it has almost more important influence, proportionately, on home productions than it has on foreign. The cost of conversion is also greater. The continental forester and timber merchant have larger quantities of stock in one district to work on, so that there are less frequent removals of the appliances for conversion. He has less costly labour. He can do much of the work of conversion on the ground where the trees are grown. Often he has the advantage of water carriage, and his railway carriage is much more economically done. When his produce arrives in this country also it is conveyed from the port to the consumer for very much less than our native timber is carried. Preferential railway rates here are equal to an annual tax on our woodlands of some four shillings per acre. But much of this could be remedied.

These, then, seem to be the essential objects to be striven for if our home forestry is to be

made equal to the future requirements of the country:—First, the largest possible crops to be grown from a given area by improved sylviculture, and large areas of cheap land devoted to a considerable extent to the production of timber so as to centralise effort. Secondly, conversion or partial conversion of the timber on the spot by means of machinery, assisted by light railways, timber slides, wire railways, water shoots, timber waggons (which, after all, will almost 'go anywhere and do anything") for local transport. Thirdly, the cheapening of transport to the more distant markets by railway rates more on an equality with those for imported timber. Fourthly, Government assistance and supervision in order to secure continuity of policy.

In the discussion which followed, Professor Bayley Balfour, of Edinburgh, said the maintenance of the supply of timber, especially of the softer kinds, was becoming a serious problem, but that the development of sylviculture in Great Britain was a complex question. Something had, however, been done to introduce improved methods, both by the Government in the Forest of Dean and by the large private landlords. The most important thing to be aimed at was the education of foresters, and in this the Government might do a great deal. There was no reason why we should not grow our own soft timber.

Professor Marshall Ward, of Cambridge, and Mr. T. H. Healey, architect, of Bradford, also spoke.

Sectional meetings were held on Friday. In the Mechanical Science Section Professor Hele Shaw read a paper on

"The Resistance of Road Vehicles to Traction."

He said: During the last few years it has been realised that there was a great field for the development of traction, and particularly by mechanical means upon the common roads, and the improvement which has been quietly taking place in the construction and maintenance of roads is a feature of national importance. Not only is the condition of the pavements in the cities and towns much improved, but in out-of-the-way districts, such as in the hilly parts of Cumberland and Westmoreland, the use of steam rollers by the county councils has effected vast improvement in the state of the roads. Experiments were made over roads of asphalt, wood, setts and macadam in the neighbourhood of Liverpool, both level and up the steepest gradients which could be found, to ascertain the resistance to vehicles. The apparatus consists of two parts—(1) a dynamometer and (2) a speed indicator. The net result of the experiments showed that, even on apparently the smoothest road, the variation in the pull was so considerable that nothing but appliances which would record autographically both the pull and the velocity at the same instant and indicate also the distance travelled, so as to indicate the exact piece of road corresponding to the record, would be of any value. Moreover, it was evident that some autographic record of the nature of the road as well as some instrument for recording the vibration of the vehicle which was being towed were necessary in order to form some estimate of the effect of vibration upon the resistance.

Mr. J. Brown gave a brief description of the viagraph, an instrument which takes a record of the profile of a road-surface on a paper strip to an appropriate scale. The instrument also indicates the total added depths of all ruts or depressions over which it passes, thus giving a coefficient of evenness for each road.

Mr. Arthur T. Walmisley, M.Inst.C.E., read a paper on

"The Use of Metal in Concrete."

The author referred to the paper read at the Liverpool meeting of the British Association descriptive of the manufacture of expanded metal by Mr. J. F. Golding, the inventor of the machinery for its production, and then dealt with its development, with special application to its introduction into concrete for supplying that tensile element which concrete without metal lacks. The present machinery is limited to sheets eight feet in length, but larger machines are in contemplation for the Expanded Metal Company's works at West Hartlepool, to enable sheets of metal long and strong enough for spans of 16ft. slabs to be supplied. Mr. Walmisley assumed that the safe-working unit stress for concrete in compression is ten times the safe-working unit stress for concrete in tension, and pointed out that, under these circumstances, with a homogeneous section of pure concrete having parallel sides the neutral axis must be above the level of the centre of gravity of a slab laid horizontally or vertically; and that, assuming—as in the case of a slab supported at the edges—that is laid flat, the neutral axis of a section divided the depth into the proportions of 0·24 and 0·76 respectively in order to create a result equal to a couple in which the compressive and tensile elements unaided by metal would be in equilibrium. Mr. Walmisley then gave calculations showing the effect of introducing metal into the tensile portion of the section, whereby the neutral axis under the above conditions of equilibrium is lowered, the compressive portion is increased, and the neutral axis made to approach nearer the centre of gravity of the section. Examples were given of a section containing wires or rods, plates, and inverted tee sections, together with a comparison of a section containing expanded metal; and the author pointed out that the latter provides a uniform distribution of tensile strength in all directions, ample in amount without extravagance, and easily laid without the responsibility of supervision in placing the material transversely at the specified distances apart, as would be necessary in the case of separate pieces.

The Insertion of Wires

or individual sections gives strength in the direction of their length, leaving the intermediate concrete comparatively weak. Expanded metal contributes strength laterally both in the direction of width and length, as well as giving an effective keyage in its depth. The coefficients of expansion of the two constituents, iron or steel and concrete, are considered for all practical purposes to be identical. Results of experiments made on various size slabs were next given, the longest span without intermediate joists being on a slab 12ft. 6in. by 11ft. clear span, which was loaded to 5½cwt. to the foot super, and bore this load for 1½ hour before it collapsed, the fractures occurring at each of the four corners. The gradual increase of the load and progress of deflection of the slab were related in detail. The adhesion of iron and concrete was found by Professor Baushinger, of Munich, to be about 569 to 668 pounds per square inch, but a case was quoted, experimenting upon 2in. diameter anchor bolts set 11½in. in a masonry block, with lead, sulphur and cement, from which it was inferred that in suitable setting the cement joint on a smooth rod might be made to fracture the rod before the adhesion of the connection failed. The author described the introduction of

The Aid of Channel Arches

by the Expanded Metal Company. The spans were enabled to be increased thereby, the only objection being, in his opinion, the exposure of the under surface of the channel metal rib; but the surface so exposed is comparatively small compared with the various systems of trough flooring that have been patented. The result of experiments was stated in the paper, the channel metal flat arches being firmly held between longitudinal joists spaced at specified intervals. The author considered that, in order to keep the portion of a slab containing metal in tension below the neutral axis, the slab should not be fixed at its bearings; but he pointed out that probably there is a tendency to form a flat arch within a concrete beam, which converts a large part of the vertical pressure into lateral thrust, which in the case of an expanded metal section becomes a tied arch, and that, in his opinion, a concrete beam should be viewed as a bar with a hollow curved soffit.

Mr. C. France remarked on the singular coincidence that, without knowing what had been done by others in this direction, he had experimented in the use of iron in this way. In a case lately, where in order to overcome the soft and spongy nature of the subsoil he had been faced with the alternative of piling or of going down 85ft. to the rock, he had of course chosen piling. When it came to the question of bridging the piles he specified concrete of this type, and as the weight carried was something like 6,000 tons, and the piles 3ft. to 4ft. apart, it would be seen that the concrete had to carry a fair load. The use of the metal had so increased the strength of the concrete that it had shown no signs of giving way.

Mr. G. F. Deacon thought that the question of time in relation to the possible

Oxidation of the Iron

was one which needed serious consideration and should induce caution in the use of metal in concrete work under water at least. He also alluded to the comparative values of Portland cement and hydraulic lime, and stated that whereas Portland cement mortar, composed in the proportion of 2½ of sand to 1 of cement, might in common practice be expected to stand from 300lbs. to 400lbs. per square inch, there was plenty of hydraulic lime in this country which, used in the same proportions, would stand from 400lbs. to 500lbs. He had brought some from Italy which would stand over 600 lbs., and he had recently been testing a sample from Russia which stood 1,260 lbs. per square inch.

Mr. John B. C. Kershaw, F.I.C., submitted a paper on

"Power Generation:

Comparative Cost by Steam-engine, Water Turbine and Gas-engine." The author said: The supremacy which the steam-engine has so long enjoyed is now assailed from two sides. The water turbine and the gas-engine have become dangerous rivals. Gas-engines up to 650 horse-power have been built, and have worked smoothly and economically; while at Seraing, in Belgium, and at other places the blast-furnace gases have been utilised for driving the engines which supply the blast. Taking the best figures for each of the three sources of power, and bringing them all to a common basis of comparison, namely, the cost of the estimated horse-power year of 8,760 hours, the author obtained the following figures:—

Comparative Costs of Electrical Power.

	Lowest cost per E.H.P. year of 8,760 hours.							
	Estimated.			Locality.	Actual.			Locality.
	£	s.	d.		£	s.	d.	
Water ..	1	5	5	Canada	1	19	0	Switzerland
Steam ..	4	18	8	N. England	4	9	7	United States
Gas (producer)	5	0	0	England	—			—
Gas (blast-furnace) ..	4	1	7	Germany	—			—

The figures in the table support the opinion, now generally held, that water when developed without excessive capital expenditure is the cheapest source of mechanical or electrical energy. The question of the practicability of large engines may be taken as settled. If they do not cost excessive sums for maintenance and repairs large gas engines, in conjunction with coke ovens and blast-furnaces, may entirely alter the present position of affairs; and the new industries which at present are being established in the neighbourhood of water-power stations may find themselves in severe competition with similar manufactures carried on in the coal and iron districts of the older manufacturing countries. It has been calculated that 2,000,000 h.-p. is annually wasted in the gases issuing from the blast-furnaces of the United Kingdom. If these waste gases could be industrially utilised in the manner suggested we should to a large extent be compensated for our lack of natural water power.

Mr. A. Siemens, who presided in the absence of Sir A. Binnie, said that Mr. Kershaw's paper had clearly demonstrated the common fallacy that there was such a vast quantity of water power in England running to waste which could be profitably employed. This was absolutely not the case. In England water supply was irregular, and any attempt to store the excess in wet weather involved excessive capital expenditure, which made it very diffi-

cult to use water power on a large scale with economy.

In the Anthropological Section Mr. A. C. Haddon, Sc.D., F.R.S., dealt with "The Textile Patterns of the Sea Dyaks," and on "Houses and Family Life in Sarawak." Mr. Haddon's explanations of the symbolism of the patterns in the wonderful embroideries of the Dyaks were extremely curious and interesting and suggested the addition to our artistic stock of an entirely new style of Eastern art, as remarkable in its way as the Chinese and Japanese styles with which we have become successively familiar.

Professor Rucker, Secretary of the Royal Society, was elected to be president of next year's meeting, which is fixed to be held at Glasgow on September 11th. A deputation from Belfast attended the meeting of the general committee, and invited the Association to hold its congress for 1902 in that city. This invitation was unanimously accepted.

On Saturday visits were paid to Bolton Abbey, Farnley Hall, Ilkley, Haworth, Knaresborough, Kirkstall Abbey and Adel. A hundred and fifty members of the engineering section visited the Nidd Valley Waterworks, which were described on Thursday in a paper by Mr. James Watson.

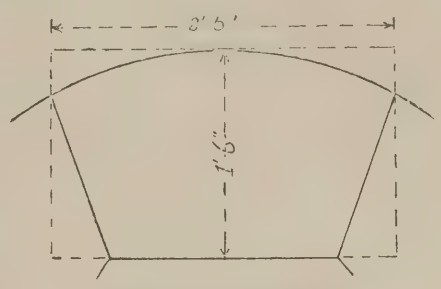
Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Lead Flat over Porch.

BECKENHAM.—ENQUIRER writes: "Please state the number and the thickness of wooden pillars (resting on York stone) required to carry a lead flat over a porch 10ft. high; also the dimensions of the bearers to carry the joists. How should the other ends of the joists be supported? Is it necessary to have hip rafters where the small span roof cuts into the main roof? If so, how should they be supported? If the common rafters of main roof rest on wall plate continued across bay, how should wall plate be strengthened?"

The solution of the question as to the thickness of wooden pillars to carry the lead flat rather depends on the number of pillars suitable to the design and the kind of timber used. It will probably be found that the minimum thickness would be hardly satisfactory in appearance, and, in fact, that the weight is a somewhat insignificant factor. If querist is anxious to determine this he can do so by the use of the following formula for square struts:—



$$S = \frac{a \times d^4}{L^2},$$

where S = safe weight, a = constant (15½ cwts. for fir), d = the side of a square strut in inches. The working load should not be taken as more than one-tenth the ultimate resistance; one-twentieth would be better. The dimensions of the bearers (from pillar to pillar) will, of course, depend on the span and may be obtained from the formula $W = \frac{cbd^2}{L}$, where W = weight to be borne in cwts., c = constant 2 for fir timbers (safe distributed load in cwts.), b = breadth in inches (may be assumed as about two-thirds of d), d = depth in inches, L = length of clear span in feet. If, however, the work is all new the floor joists might well be continued out through the wall over the porch, in which case the flat would be practically self-supporting, the joists acting as cantilevers. A small bressummer (say, three 7ins. by 2ins. bolted together) should be placed across the opening for bay over the porch to carry the feet of the rafters, unless they are stopped on valley-pieces, which seems the better method. Over the porch or bay hip rafters would be necessary to carry the short or "jack" rafters. Probably about 7in. by 1½in. would do in this case for both hips and valleys: they would be fixed to the ridge and the angles of the wall plates. A. G. B.

Taking-out Quantities.

TEWKESBURY. — ARCHITECT writes:—"(1) How should the quantities be taken out for brick machicolations? (2) Also how would the quantity of stone in large circular piers, such as those in Gloucester Cathedral, be taken out?"

(1) There are various methods of dealing with an item of this description, but on the whole the best one is to number each complete, giving width on face, height and projection, including labour and materials and the cutting in facing at sides. (2) If each course is in one stone the following would be the items required, taking as an example a stone 3ft. diameter and 1ft. high:—

TAKING-OUT QUANTITIES.

```
3  0
3  0
1  0
———      9  0   stone (no labour).
3  0
3  0
———      9  0
2 / 3  0          }
  1  0            } bed and joint.
———      6  0   }
(Circumference).
9  6
1  0
———      9  6   circular plain face.
```

If each course is made up of more than one stone the following example will explain the method to be adopted:—

```
   2  6
   1  6
   1  0
   ———      3  9   stone (no labour).
   2  6
   1  6
   ———      3  9
   2  6             } bed and joint.
   1  0
   ———      2  6   }
2 / 1  5
  1  0
  ———      2 10   sunk joint.
  2  8
  1  0
  ———      2  8   circular plain face.
```

As the question of measuring stonework is a somewhat complex one "Architect" would do well to refer to a work confined to quantity surveying, as "Quantities and Quantity Taking," by W. E. Davis, "Builder" Students' Series (price 3s. 6d.), as an elementary work, or "Quantity Surveying" by John Leaning (Spon, 15s.) as a more advanced one. W. E. D.

Constructing Lean-to Roof.

BECKENHAM. — ENQUIRER writes: "In a lean-to roof, how should the rafters be fixed against the main wall so as to avoid the flues? Is it necessary to corbel out, and, if so, how far apart and of what dimensions should the corbellings be? How should the bearer be fixed to the main wall?"

We presume that the roof in question (tracing not reproduced) runs along the whole of the wall containing the two flues, and that the glass covering and the slate covering lie all in one plane, starting from the eaves, which are 10ft. high. Apparently there would be sufficient support at the feet of the rafters where a wall plate would rest on the 9in. wall. At the upper end we should recommend—(*a*) If the main wall is already constructed, that small iron corbels be inserted in the brickwork at convenient intervals of not more than about 3ft. span; to these the wall plate, which should be at least 4in. by 3in., could be screwed from the underside, and a rendering of cement might with advantage be added between the plate and the flues. (*b*) If the whole of the work is new, two or three oversailing courses might be built in the brickwork; the upper one projecting 4½in., running the whole length of the wall, would answer the purpose sufficiently. A. G. B.

R.I.B.A. Examinations.

BIRMINGHAM. — BRUM writes: "I have passed first-class Advanced Building Construction and intend to sit for the A.R.I.B.A. Would you advise passing in Honours Construction before commencing to study for the A.R.I.B.A., or leave Honours Construction and commence forthwith? What arithmetic is necessary in order to work out the different formulæ given in some works, and what are the books on arithmetic I should obtain? I have no knowledge of algebra or Euclid."

With regard to the first question, "Brum" does not state whether he intends to enter for the progressive examinations of the R.I.B.A. or for the Special Final (open to architects in practice who are more than twenty-five years of age and chief assistants who are more than thirty years of age), by which he would obtain exemption from the Preliminary and Intermediate Examinations. Presumably, the former is his intention, and, if so, he would probably do well to go in at once for the Preliminary and Intermediate Examinations and get them over; the Final could then be read for side by side with the Honours Building Construction. As to the second question, we should strongly advise querist to take up at least the elementary parts of Euclid and algebra—say the first four books of Euclid and algebra up to quadratic equations (according to any of the usual text-books). Among the many good text-books on these subjects may be mentioned Todhunter's (for beginners) and Hall and Knight's.

A. G. B.

NEATH.—PROBATIONER writes: "Please say whether the following books will be sufficient for me to study (and to prepare the 'Testimonies of Study' from) for the Intermediate R.I.B.A. Examinations:—1. Fletcher's 'History of Architecture'; 2. Parker's 'Introduction to Gothic Architecture'; 3. Spiers' 'Orders of Architecture.' Please also give a few examples of what is required for the following:—Details of Classic ornament from the round in outline. Mediæval ornament, freehand drawing from the round in outline. Is Gwilt's Encyclopædia modern enough to be worth obtaining for general subjects, such as descriptive geometry, perspective, &c.?"

We can hardly say that "Probationer's" list is sufficient. In history alone the books mentioned would cover a good deal of the ground, but the following might be added:—Smith and Slater's "Classic and Early Christian Architecture"; Roger Smith's "Gothic and Renaissance Architecture"; Parker's "Glossary"; Colling's "Gothic Details" (for reference). A complete list of books recommended is to be found in the Kalendar of the R.I.B.A. Gwilt's Encyclopædia is brought up to date from time to time, and is a very useful work of reference, but for the special subjects mentioned by querist we should recommend the elementary text-books; for instance, Gill's Imperial Geometry, or, for more advanced study, Angel's Geometry. Fergusson's "Architectural Perspective" is also a useful book.

A. G. B.

Obstruction of Ancient Lights.

BANGOR.—BANGOR writes: "I intend carrying out alterations and additions to certain business premises, and should be glad to know, before letting the contract, whether or not the additional storey would interfere with my neighbour's ancient lights. I enclose sketch plan and section (not reproduced)."

It is quite impossible to tell from a drawing of the existing and proposed buildings, and of the position and dimensions of the ancient

window, whether the works when completed will or will not cause an actionable diminution of the light which at present reaches that window. A variety of circumstances affect the question, such as the direction from which the main supply of light to the window comes, the quantity of light which it receives from the direction in which the obstruction caused by the new building will stand, and so on. There are no hard and fast rules as to the obstruction of ancient lights. We have pointed out more than once to our correspondents that the question is one of fact in each case. The supposed rule of law that a building will not obstruct the light if it permits it to fall on the window at an angle of not less than 45 deg. from the vertical has no existence, though it may be useful as a rough guide. We regret, therefore, that we can give our correspondent no assistance in a matter which can only be decided by a person on the spot; and even he may be unable to forecast with accuracy the effect which will be produced on the light by buildings which are still in embryo. H. P. B.

Stress on Steel Bar.

KING'S NORTON.—F. E. T. writes: "What is the safe stress to put on a bar of steel 2in. by $\frac{3}{8}$in. in tension and compression?"

It depends upon the ultimate strength of the steel in question, but assuming that to be ordinary basic steel having an ultimate strength of 26 tons per square inch, and taking a factor of safety of 4, a 2in. by $\frac{3}{8}$in. bar in tension would carry $4\frac{3}{4}$ tons. If there be any holes in bar, say for $\frac{3}{4}$in. rivets, the safe stress would be reduced to 3 tons. It is not possible to say anything with regard to the safe stress under compression without knowing the length of the bar, and whether any bending moments be produced in it by the manner in which the load is applied. BREES VAN HOMAN.

Contract Work.

MANCHESTER.—S. D. J. writes: "(1) Is it the general custom for an architect to supply a contrac or with a specification of work between them? (2) Is there any substitute which would be deemed equivalent to a specification? (3) Are there any recognised charges between architect and proprietor?"

(1) Yes. (2) A bill of quantities might be substituted, in which the particulars and methods of work would have to be described. This is not a satisfactory method, however; the bill of quantities, if provided, should be in addition to the specification. (3) No. The rate of payment should be fixed between the architect and the building owner before the former does any work for the latter. The best plan is get the building owner to agree, in writing, to the R I B.A. scale of charges. There is no legal scale of fees binding a client.

Model Bricks.

COLWYN BAY.—W. J. writes: "I should be glad to know the address of a maker of model clay bricks. The bricks I mean are made to scale, and are about an inch long and about a quarter of an inch wide. They are exact representations of red pressed bricks, and are used for teaching how to make bonds of walls, &c, in detail."

The model bricks required by our correspondent can be obtained from Messrs W. Payne and Son, 16 and 17 High Holborn, W.C., who are the agents for the makers, Messrs. F. Ad. Richter and Co., of Rudolstadt, Germany. The different shapes have been determined by Mr. Richter's art department, consisting of a number of experienced architects. A booklet is obtainable giving figured illustrations of the bricks, or stones as they are called.

More "Builders' Journals" Wanted.—The publisher will be pleased to send a copy of the current number of the "Architectural Review" to any reader in exchange for "Builders' Journals" of the following dates:—February 8th and 15th and April 19th, 1899. We are obliged to those readers who have already sent copies.

Trade and Craft.

Electric Arc Lamps.

The enclosed long-burning "Ark" lamp recently introduced by Messrs. Johnson and Phillips, of Victoria Works, Old Charlton, Kent, has met with great success, and to enable the increasing demand for it to be supplied (and also to meet foreign competition) the firm has erected new shops and machinery for its manufacture. We have received a copy of the catalogue dealing with this new "Ark" lamp, which embodies all the best points in design that Messrs. Johnson and Phillips have determined during twenty years' experience as arc lamp manufacturers. The following claims are made for it: It provides the cheapest known illuminant; it burns in deoxygenated air, prolonging its life fifteen or twenty times and effecting an economy in carbons and trimming which more than saves the cost of the lamp in one year; its candle power is about 2,000 per 500-watt lamp; it gives a soft and diffused light; it is perfectly automatic; and it has only one working part (the armature). Sample lamps are sent out to responsible persons for trial on condition that, if not approved, they are returned within three weeks, carriage paid. Their price varies between £4 15s. and £6. A copy of the catalogue under notice (which is excellently produced and includes some good specimens of colour printing) will be supplied to the trade on application.

Driving Belts and Leathers.

It is a pleasing feature in the price lists of Messrs. Fleming, Birkby and Goodall, Limited, manufacturers of belting, hydraulic leathers, &c., of West Grove Mill, Halifax, that they contain a number of useful hints and data about the particular articles dealt with. For instance, they issue a very handy little pamphlet entitled "Hints on Hydraulic Leathers," which describes and illustrates the various methods of packing (both past and present) and comments on their respective merits. As is stated, the chief reason why perfect leather packings have been so difficult to obtain is that they have been made either by the tanner and currier or by the mechanical engineer, singly. It is the combination of these two which produces the best result; and this is what Messrs. Fleming, Birkby and Goodall have done by placing at the head of their hydraulic leather department an expert who has had the training of a mechanical engineer and the experience of a tanner. In the matter of belts a similar discretion has been observed. Fleming's "Standard" oak-tanned belting is made from the prime parts of the hide, well stretched, and is curried expressly to secure strength, uniform toughness, and durability. The "Teon" belting is a substitute for indiarubber, balata and similar beltings; and the manufacturers claim that it possesses all the good qualities of these belts and none of their disadvantages. As regards pulleys, the firm has a speciality in the "Gilbert," which is made of thoroughly seasoned maple, runs true, gives a good grip, and wears well. Messrs. Fleming, Birkby and Goodall, Limited, should be applied to when belts, leathers and similar articles are required; their London office is at 39 Lime Street, E.C.

The Acquisition of the Alexandra Palace and Park may now be taken to have been accomplished. The amount originally asked for was £120,000, but it was deemed desirable to enfranchise the leasehold portion of the land and to purchase the "Grove." Therefore the amount was increased to £150,000. Of this sum £144,500 has been promised, and the Parks and Open Spaces Committee of the London County Council now recommend a grant of £7,000. This sum, which is necessary to enable the Council to have a representative on the Board of Trustees, will give a surplus of £1,500. The scheme upon which the trustees will work is to maintain the grounds as they are, to lease the theatre and concert-hall for performances, and to continue to let the racecourse. The banqueting hall is to be devoted entirely to Volunteer purposes, and a polytechnic is to be established.

THE GRANITE BUILDERS OF EGYPT.

THE ancient Egyptians watched the effect of atmospheric and other influences on stones, and wisely profited by the lessons taught them by experience. They learned that earth, abounding with nitre, from its attracting moisture, had the effect of decomposing granite but that in the dry climate of upper Egypt the stone remained for ages uninjured when raised above all contact with the ground. When, therefore, there was a possibility of its being exposed to damp they based an obelisk or other granite monument on limestone substructions, and these last are found at the present day perfectly preserved, while the granite above them gives signs of decay in proportion to its contact with the earth subsequently accumulated around it. This refers to Upper Egypt, visited only four or five times in a year by a shower of rain, for in the Delta granite remains have been affected in a far greater degree than in the Thebaid: nitre abounds there, and it is remarkable that the obelisks at Alexandria have suffered the least on the sides next the sea. The Egyptians seldom used granite as a building stone, except for a small sanctuary in some sandstone temple; and in the later times of the Ptolemies one or two temples were built entirely of granite. But in the true Egyptian period the use of that stone was chiefly confined to the external and internal casings of walls, to obelisks, doorways, monolithic shrines, sarcophagi, statues, small columns and monuments of limited size, and was sometimes employed for roofing a chamber in a tomb.

The durability of granite varies according to its quality. The felspar is the first of its competent parts which decomposes, and its greater or less aptitude for decay depends on the nature of the base of which the felspar consists. Egypt produces a great variety of granite, and the primitive ranges in the desert to the east of the Nile, about thirty-five miles from the Red Sea, supplied the Romans with numerous unknown kinds, as well as with porphyry, which they quarried extensively in that district; but the granite of the ancient Egyptians came from the quarries of Syene, in the valley of the Nile, and from these they obtained what was used for their monuments. It is from this locality that the name "Syenite" has been applied to a certain kind of granite; it is, however, far from being all of the same nature, and a small portion only of the stone found there is really what we now call "Syenite."

At the early period of the third and fourth dynasties, between twelve and thirteen centuries before the Christian era, the Egyptians extensively employed granite for various purposes. They had learned to cut it with such skill that the joints of the blocks were fitted with the utmost precision; deep grooves were formed in the hard stone with evident facility, and it must have been known to them for a long period before the erection of the oldest monuments that remain, the Pyramids of Memphis, where granite was introduced in a manner which could only result from long experience. In the time of the first Osirtasen, about 2050 years before the Christian era, granite obelisks were erected at Heliopolis and in the Fyoom, and other granite monuments were raised in the same reign at Thebes, from which we find that even then the Egyptians had learned how the damp earth acted on granite when buried beneath it; and this interesting question suggests itself—How long before that time must the stone have been used to enable them to obtain from experience that important hint which led them to place granite on limestone foundations?

Desecration of the Tower.—The Society for the Preservation of Ancient Buildings held a meeting last week, when attention was called to the new guard-house at the Tower. A good deal of feeling was expressed on the subject by some of the members, and the action of the War Office in placing a modern brick building between the two oldest towers was generally condemned; but it was felt it would be outside the scope of the society to take any action in respect to new premises so long as they did not structurally injure any old building.

Keystones.

New Co-operative Premises at Paisley have been opened by the Paisley Provident Co-operative Society. The new branch is situated in Bank Street, and consists of dwelling-houses and two shops—a grocery and a fishmonger's.

A new Stained-Glass Window in Ely Cathedral has been placed in Bishop Alcock's chapel. It is the work of Messrs. Clayton and Bell, and has four large figures in it, of Hugh de Northwold (1249-54), Hugh de Balsham (1257-86), Bishop John Hotham (1316-37), Bishop John Alcock (1466-1500).

A new Window at St. Paul's Church, Penzance, has just been erected. The window contains figures of Thomas Cranmer, Archbishop of Canterbury, and of Nicholas Ridley, Bishop of London, two of the martyrs of the Reformation period. The window was designed by Mr. Reginald T. Dick, of Newlyn.

A Boys' Club at Salford is to be built and endowed by Messrs. W. and J. Groves, of Salford, at a cost of £10,000, the site costing another £1,000. The trustees of the Harling estate have also promised to build a club for girls, at a cost of £5,000. The site of both institutions is on land formerly occupied by the barracks.

St. Bartholomew's Church, Bristol, has been fitted with a tower clock. There are two dials, one on the south and one on the west wall of the tower. These dials are 5ft. in diameter, and are made of iron with carved centres, the figures and hands being gilded, and the centre decorated blue. It is of horizontal construction, with an iron bed, upon which the trains of wheels are built on plummer blocks, the wheels being made of gun metal and brass with steel arbors and lantern pinions. The diameter of the great wheel is 12in. A special cupola has been built on the roof of the tower for the bell. The clock has been made by Messrs. Kemp Brothers, of Bristol.

The Guildhall is undergoing considerable alterations. The Art Gallery is being enlarged by the acquisition of a part of the Mayor's Court offices. For some years past, since art loan exhibitions have been held in the Corporation Gallery, the want of space in the present structure has been very apparent, hence the determination of the Court of Common Council to enlarge it. A ladies' gallery is being erected opposite the canopy under which the most distinguished guests at Mayoral banquets always sit. Hitherto the special accommodation for ladies has been confined to a temporary structure put up every Lord Mayor's day. The left wall of the porch—the most ancient part of the Guildhall—is undergoing some alteration in order to improve the means of communication to the suite of offices occupied by the City Comptroller.

The new Public Baths at Stockbridge which have been erected by Edinburgh Town Council have just been opened. They are situated at the west end of Saxe-Coburg Place, having an access therefrom, and also from the low level of Glenogle Road. The main pond is 75ft. long and 35ft. wide, with a depth from 3ft. to 7ft. 6in. Below the pond hall floor there is a basement. The pond itself is built entirely of concrete, the exposed surface being lined with white enamel brick. Round the pond there are arranged the dressing boxes for the use of the bathers. On the floor above there is a gallery round the pond, access to which is obtained from the entrance hall. On this level there are twenty-one ordinary slipper baths. A new departure has been adopted by the Corporation in providing a Russian bath, with six retiring lounges. At the north-west corner of the building there is an exit communicating with the gallery level and pond hall, to be used on the occasion of swimming galas. At the east end of the pond hall and practically on the gallery level there are nine first-class bath rooms. On the gallery level there is a club room. At the west end of the pond hall there is a gymnasium room. There are rooms for the staff. The estimated cost of the undertaking is slightly over £15,000.

The Royal Institute of British Architects intend to hold their annual meeting in Glasgow in October, 1901.

A Stained-Glass Window to the author of the "Pilgrim's Progress" is to be placed in St. Saviour's, Southwark.

The Isolation Hospital at Cuddington is undergoing alterations and new wards are being erected. Mr. H. D. Searles Wood, of 157 Wool Exchange, Coleman Street, is the architect.

Messrs. A. J. Arrowsmith and Co., of 80 New Bond Street, have been awarded a silver medal for their excellent oak work, panelling, &c., in the English Royal Pavilion at the Paris Exhibition.

Macclesfield Church is being restored. An anonymous donor has offered £1,000 towards the £5,000 still needed, on condition that the whole amount is raised before the reopening early next year. The restoration has already cost £20,000.

Homes for Consumptive Patients.—The second of a series of six homes for sufferers from consumption to be erected in Scotland has been opened at Bridge of Weir, Renfrewshire. It is the gift of Mr. James Carnegie, of Lochearnhead, has cost £12,000, and provides accommodation for forty-four patients.

Prizes for Drawings.—The London County Council Technical Education Board announce that they are prepared to award four prizes—two of the value of £15, and two of the value of £10—for careful drawing studies in museums and old churches, especially the South Kensington and British Museums.

An American Hotel, said to be the first in England, is proposed to be erected near Waterloo Railway Station. A New York architect came to England over a year ago at the request of the directors of the syndicate responsible for the new enterprise. The structure will be entirely of steel, and the steel beams are already being cast at Sheffield.

The King's College Course in Architecture, Building Construction, &c., is under Professor R. Elsey Smith, Messrs. C. H. Reilly and James Bartlett. The syllabus for the session 1900-1 has just been issued, giving particulars of all the day and evening classes, and of prizes offered to students by the Carpenters' Company. There are also classes in wood-carving, conducted by Messrs. W. H. Howard and G. J. Bull.

A "Home of Rest" at Bare, Morecambe, for the Girls' Friendly Society has just been dedicated. The building is in the Elizabethan style. On the ground floor is a large dining room looking out on the Promenade, as well as a cloak room, with special entrance for the girls. The first floor is arranged so as to include sitting room, matron's sitting room, and dormitories, extending to the rear, while the third floor is almost exclusively occupied by dormitories. The architect is Mr. Maidman, of Edinburgh, whose plans were selected in a public competition.

The Peking Palaces.—Mr. C. J. Holmes, writing in the "Times," says:—"Our telegrams from the Far East continue to indicate that the Allies may punish the Chinese by the destruction of the Imperial Palaces at Peking. Before the palaces are razed to the ground, could not some well-known expert be asked to look through their contents and preserve for our museums all relics that there may be of the ancient art and literature of the Chinese? Photographic records might be taken of the things that could not readily be carried away. It is certainly better that such records should exist in our museums than that they should not exist at all. Care, at least, should be taken to avoid the irremediable damage done at the burning of the Summer Palace, when hundreds of the most ancient specimens of Chinese painting perished in the fire, with everything else that no soldier thought worth the looting. Such damage may not seem important to us at present, because our knowledge of the art of the Far East is so imperfect. For that very reason we should be careful not to destroy by an act of hasty anger archæological treasures which we can never replace."

The First Permanent Board School for Blackpool is being erected in Central Road, Revoe.

The Fylde District Pupil Teachers' Centre was opened last week at the Technical School, Blackpool.

A new Dining and Ceremonial Hall, to be called the Principal Rainy Hall, is being added to the Edinburgh New College.

A new Town Hall at Atherton was opened last week. The new building, which has been erected at a cost of nearly £4,000, occupies the site of the old Public Hall.

An Electric Lighting Station at Ilford is being erected by the Ilford Urban District Council. This is intended to supply the public lighting and the tramways in the district. The new building is situated in Ley Street, and will have a shaft 180ft. high. Mr. Herbert Shaw, A.M.I.C.E., surveyor to the Urban District Council, is the architect of the new building, and Mr. George Sharpe the builder.

Cottage Homes at Stockton have been erected by the Board of Guardians at a cost of between £10,000 and £11,000. Two pairs of the homes are situated in Windsor Road and two in Hartington Road. They are built of grey clamped bricks throughout, with stone corner facings; they have been made so that should the scheme not turn out a success the homes can be speedily adapted at slight cost for ordinary habitable purposes. Each home is built to accommodate fifteen children, under the charge of a foster-mother.

The Building Trades' Gift to the Nation.—The executive committee, representing the architects, master builders, operatives of all branches, and manufacturers and builders' merchants in Birmingham, appointed to collect subscriptions in that district in aid of the Gift, met last week. Mr. F. G. Whittall (President of the Birmingham Master Builders' Association) presided. Mr. William Sapcote (hon. treasurer) read a letter from Mr. T. F. Rider, F.R.G.S. (London), congratulating the Birmingham executive on the splendid effort they had made on behalf of the fund. Mr. Matthews, on behalf of the operative carpenters, handed in a contribution of £66, and Mr. H. Duckett one of £25 on behalf of the operative plasterers. Other representatives of the operatives handed in small donations, and Mr. Sapcote remarked that Birmingham would contribute something like £500 to the fund. As several promised contributions had not been received it was decided to adjourn the meeting till October 9th, on which date the local collection will be closed.

Law Cases.

Obtaining Injunctions against Trades Unions.—In the case of the *Taff Vale Railway Company* v. *The Amalgamated Society of Railway Servants*, heard last week in the Chancery Division of the High Court of Justice, judgment was given upon the question of whether the defendant society could be included in the injunction granted against Mr. Bell and Mr. Holmes restraining them from watching or besetting, or causing to be watched or beset, the Great Western Railway Company at Cardiff. Mr. Justice Farwell, in giving judgment, said the society had taken out a summons to strike out their name as a defendant, the ground being that they were neither a corporation nor a body that could be sued. It was true that a trades union was neither a corporate body, individual, nor partnership. The question, however, turned upon the true construction of the Trades Union Acts of 1871 and 1876. Having regard to those Acts, it could not be said that a trades union was not a legal combination. The association could own property and could act by agents. The fact that it could act by agents gave it the same duties and the same liabilities as the law imposed upon a private individual. He could not think that the Legislature would have legalised the existence of an irresponsible body. Upon that construction of the Act, he must dismiss the motion. An injunction was granted against the society in the same terms as against the other defendants.

Engineering Notes.

The Ruskin Union intends to hold its first congress at Sheffield on September 21st and 22nd. Lord Windsor will deliver the presidential address.

Proposed new Pavilion at Bournemouth.—A Local Government Board enquiry was held at Bournemouth on Friday into the application of the Corporation to borrow £37,000 to erect a pavilion on the shore end of the pier. Strong opposition was raised.

East Ham Electric Station.—The foundation-stone of the shaft for the new electricity station which is being erected by the East Ham Council in connection with the scheme for electric tramways and lighting was laid last week. A few hours before the ceremony the roof of part of the unfinished building collapsed and slightly injured two workmen.

Profitable Electricity.—At the St. Pancras Vestry's meeting last Wednesday, Dr. W. Smith, chairman of the Electricity Committee, presented a report showing that the nett profit on the local electrical undertaking since its beginning, in 1892, was £18,288. Dr. Smith explained that the Vestry would hand over to its successors, the new Borough Council, a property worth £300,000, which had not and would not cost the ratepayers a penny. Had their undertaking been a joint stock concern, it would have paid a dividend at the rate of 6 per cent.

The Houses Supplied by the London Water Companies.—Some indication, if not a conclusive one, of the number of houses in London may be gathered from the approximate number of houses served by the various metropolitan water companies. The New River Company heads the list with about 133,000 houses on its books. Southwark and Vauxhall Company follows with 114,000; East London, 104,000; Lambeth, 82,311; Kent, 62,426; West Middlesex, 62,044; Chelsea, 37,905; and Grand Junction, 33,469 houses.

The Northampton Institute, Clerkenwell, E.C.—We have received a copy of the announcements for the Session 1900-1. The chief new departure is the establishment of engineering day courses, which include mechanical, electrical, and horological engineering. In the electrical engineering department, in addition to ordinary work in lighting and power distribution, special attention will be given to electric traction and electro-chemistry. The winter term begins on Monday, October 1st, and ends on Friday, December 21st.

Development of Sunderland Docks.—The extension of the South Dock, which has been taken over by Sir John Jackson, who secured the contract, is going rapidly forward at Sunderland. The work now in hand includes the alteration of No. 1 gateway and the enlargement of Hudson Dock North. At present the gateway has an entrance of 45ft. only: it is being enlarged to 70ft. clear, widening out to 104ft. at the basin entrance. The contractors are now busy putting in coffer-dams of concrete preparatory to removing the old gateway. The use of concrete in the construction of dams is a new departure, but it has already been successfully carried out by the contractors at Devonport. The next work to be taken in hand is the enlargement of the Hudson Dock North.

City of London College.—The Michaelmas term of this college (which is situated in White Street, Moorfields, E.C.) begins on Monday, October 1, and ends on Saturday, December 22. In the engineering department, which is under Professor Henry Adams, the well-known specialist and instructor, classes will be held for technical drawing and construction, building construction honours, sanitary, civil and mechanical engineering and practical sanitary science, quantity surveying and levelling, valuation, theodolite work, engineering field work, town surveying and the laying-out of building estates. The College Calendar giving full particulars of all the examinations, classes, &c., can be obtained for 9d., post free.

New Companies.

Sheaf Pottery Company, Limited.

This company was registered on August 24th with a capital of £1,000 in £1 shares to acquire the business lately carried on by Frederick A. Spruce as the Sheaf Pottery Company at Commerce Street, Longton, Staffordshire, and to carry on the business of earthenware and china manufacturers, &c.

Southend-on-Sea Estates Company, Limited.

This company was registered on August 30th with a capital of £120,000 in £10 shares to acquire, sell, hold, let, improve, build upon, use, and develop any real or personal property in the neighbourhood of Southend-on-Sea or elsewhere; to lay out land for building purposes, as builders and contractors, brick, tile and terra-cotta manufacturers, &c. The first directors (of whom there shall be not less than four) are J. G. Sadd, A. G. Sadd, J. P. Sadd and H. A. Dowsett. Registered office: 3 Alexandra Street, Southend.

Foster Estates Company, Limited

This company was registered on August 30th with a capital of £100,000 in £10 shares to acquire certain land at Chislehurst, Kent the property of R. Foster; to lay out the same, or any other land, for building purposes; to construct and maintain any rail or tram roads, wharves, docks, piers, warehouses; as builders and contractors, dealers in every description of stone, sand, lime, bricks, tiles and terra-cotta; timber merchants, sawmillers and sawmill proprietors; as house agents, producers and suppliers of gas and electricity for the purpose of light, heat or power. The first directors (of whom there shall be not less than three nor more than five) are R. Foster, W. F. Foster, R. Foster, jun., J. Foster and M. Foster.

Westleigh Estates Company, Limited.

This company was registered on August 17th with a capital of £93,000 in £1 shares to acquire certain real estate and rent charges, subject to the leases and agreements, situate in or issuing out of land in Westleigh and Hindley, Lancashire, to develop and extend the same, and generally to carry on the businesses of colliery proprietors, mine owners, coal and iron masters, coke manufacturers, &c.; as builders and contractors, ironmasters, steel converters, builders of engines, machinery and all kinds of rolling stock; to develop the resources of land by planting, clearing, farming or building thereon, &c. The directors are H. Bubb, J. Pendlebury, W. H. Hampson, H. G. Gregory, J. Fletcher and H. Pendlebury, H. Bubb to retain office so long as Mrs. Bubb or her executors hold 48,000 shares.

Tasmanian Timber Corporation, Limited.

This company was registered on August 18th with a capital of £120,000 in £1 shares to carry out an agreement between J. C. Kemsley and this company for the acquisition of the business of timber merchants, &c., and, generally, to carry on the businesses of timber merchants, sawmill proprietors, timber growers, manipulators, importers, exporters and workers and dealers in timber and wood of all kinds, manufacturers of wooden articles, shipbuilders and owners, wharfingers, carriers, &c., and other rights, grants, leases, claims, concessions, &c., in any part of the world, and to develop, deal with, work and turn to account the same in such manner as the company shall see fit; as miners, smelters and metallurgists; to lay out land for building purposes; as shippers, shipowners, carriers by land and water; to develop the resources of land by planting, clearing, draining, farming, &c.; as engineers and metal founders, producers and suppliers of gas and electricity for the purposes of light, heat or power; as bankers, financiers, and concessionnaires; stock and share dealers, &c. The first directors (of whom there shall be not less than three nor more than seven) are to be elected by the signatories to the memorandum of association—G. A. Murray, J. C. Kemsley, J. A. Waterhouse, F. W. Eccardt, G. L. Le Sueur, W. B. Pipkin and E. Richardson.

Sheffield Building Trades Exchange Co., Lim.

This company was registered on September 1st with a capital of £6,000 in £1 shares to acquire a plot of freehold land containing 263 square yards or thereabouts, extending from Upper Charles Street to Cross Burgess Street, Sheffield, and having frontages to those streets of 31ft. and 41ft. respectively, to erect a building or buildings for use as an exchange and club house, and to establish and carry on a builders' exchange. The number of directors is not to be less than six nor more than eight. The subscribers — James Longden, John Biggin, Alfred J. Forsdike, Arthur Mastin, John D. Cook, Arthur Bradbury and Martin Grantham, all builders of Sheffield—are to appoint the first.

Nov.	30	Swansea—Harbour Offices	£100, £50	T. Strick, Harbour Offices, Swansea.

COMING EVENTS.

Wednesday, September 12.

BRITISH ASSOCIATION.—Meeting at Bradford (seventh day). Concluding general meeting at 2.30 p.m.

INSTITUTE OF SANITARY ENGINEERS.—Meetings of Examination and Literary Committee at 2.30 p.m., General Purposes and Finance Committee at 3.30 p.m., Election Committee at 5 p.m., and members' sessional meeting at 7 p.m.

Thursday, September 13.

BRITISH ASSOCIATION.—Meeting at Bradford (eighth and last day). Excursions to places of interest in the neighbourhood.

Monday, September 17.

SANITARY INSTITUTE—Lectures and Demonstrations for Sanitary Officers: Part I. Mr. John Castell-Evans on "Mechanical Physics, Laws of Motion, Hydraulics, &c.," at 8 p.m.

IRON AND STEEL INSTITUTE—Meeting of Council at 10 Rue Lafitte, Paris, at 6 p.m.

Tuesday, September 18.

INSTITUTION OF MINING AND MECHANICAL ENGINEERS (Annual Meeting in the Crown Court, Bristol, first day).—Reception by the Lord Mayor of Bristol. Sir Herbert Ashman, the Secretary, will read the Annual Report of the Council. Mr. James McMurtrie, F.G.S., on "The Geological Features of the Somerset and Bristol Coal-field, with special reference to the Physical Geology of the Somersetshire Basin;" Mr. George E. J. McMurtrie, Assoc. M. Inst. C.E., on "Methods of working the Thin Coal Seams of the Bristol and Somerset Coal-field;" Mr. W. A. E. Ussher on "The Culm-measure Types of Great Britain;" Mr. Edward Gledhill on "The Analogy between the Gold 'Cintas' of Columbia and the Auriferous Gravels of California;" Mr. J. J. Sandeman on "Gold-mining in the Rossland District, British Columbia;" Mr. H. W. Halbaum on "The Theory of the Equivalent Orifice Treated Graphically;" Mr. J. A. Jones on "Development and Working of Minerals in the Leon District, Spain;" Mr. James Stirling on "The Geological Age of the Gold Deposits of Victoria, Australia;" Mr. W. K. Lawrence on "Saltford Slip," at 10.30 a.m. Excursion to Avonmouth Dock, Granary and Cold Storage Warehouses at 2.20 p.m.

IRON AND STEEL INSTITUTE—Autumn meeting at 44 Rue de Rennes, Paris. Address by the President, Sir William Roberts-Austen, K.C.B., D.C.L., F.R.S.; Mons. H. Pingent, Secretary of the Comité des Forges de France on "The Development of the Iron and Steel Industries in France since 1889;" Professor H. Bauermann (Ordnance College, Woolwich) on "Iron and Steel at the Paris Exhibition;" Mr. Albert Ladd Colby (South Bethlehem, Pennsylvania) on "American Methods of Testing Iron and Steel;" Mr. Alfonso Dory (Bilbao) on "The Washing of Iron Ore," at 9.30 a.m. Visit to the Exhibition at 2 p.m. Soirée Musicale et Littéraire held by the Comité des Forges de France, at 9 p.m.

CUMBERLAND AND WESTMORELAND ANTIQUARIAN AND ARCHÆOLOGICAL SOCIETY.—Meeting at Bowness, Windermere (first day). Excursion to Kentmere and Garburn. Mr. H. Swainson Cowper, F.S.A., on "The Recently discovered Roman Road at Ambleside" and "A Contrast in Architecture: Part I., Primitive Quadrilateral Structures: Part II., An Archaic Survival." Mr. J. A. Martindale on "The British Camp at Mill Riggs, Kentmere."

Wednesday, September 19.

INSTITUTION OF MINING AND MECHANICAL ENGINEERS (Annual Meeting in the Crown Court, Bristol, second day).—Visit to the Bristol Tramways Company's Electric-power Station, Counterslip, at 9 a.m.; Excursion to Bath, Roman Baths, &c., and Bath Stone Quarries at 11 a.m.

IRON AND STEEL INSTITUTE.—Mr. Louis Katona (Resicza, Hungary) on "Rolling Mills;" Baron H. von Jüptner (Donawitz, Austria), on "The Constitution of Slags;" Mr. E. F. S. Lange (Manchester) on "A New Method of Producing High Temperatures;" Messrs. Godfrey Melland, B.Sc., Assoc.R.S.M., and Mr. H. W. Waldron, Mason University College, Birmingham, on "The Action of Aluminium on the Carbon of Cast Iron;" Mr. J. E. Stead, Member of Council, on "A Micro-chemical Research on Iron and Phosphorus." Visit to Exhibition at 2 p.m. Banquet at the Hôtel Continental, Rue Castiglione.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers: Part I. Mr. John Castell-Evans on "Natural Forces; Light, Heat, Electricity; Chemistry," at 8 p.m.

CUMBERLAND AND WESTMORELAND ANTIQUARIAN AND ARCHÆOLOGICAL SOCIETY.—Meeting at Bowness, Windermere (second and last day). Excursion through the Winster Valley to Grange-over-Sands. Mr. H. Swainson Cowper, F.S.A., on "Cawmire (Comer) Hall." The Rev. Canon Rawnsley on "William Pearson of Borderside, Winster."

Thursday, September 20.

INSTITUTION OF MINING AND MECHANICAL ENGINEERS (Annual Meeting in the Crown Court, Bristol, third and last day).—Excursion to Cheddar and Wells at 9.30 a.m.

IRON AND STEEL INSTITUTE.—Autumn Meeting at 44 Rue de Rennes, Paris. Visit to Exhibition at Vincennes (Locomotives, Railway Plant and Machine Tools), at 10 a.m.

Friday, September 21.

INSTITUTE OF SANITARY ENGINEERS.—Examination in Practical Sanitary Science.

IRON AND STEEL INSTITUTE.—Autumn Meeting at 44 Rue de Rennes, Paris. Visits to St. Chamond Works at 7.48 a.m. and to Hayange Works at 8 a.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers: Part I. Mr. John Castell-Evans on "The Atmosphere: Pressure and Composition; Air; Combustion and Respiration," at 8 p.m.

Saturday, September 22.

INSTITUTE OF SANITARY ENGINEERS.—Examination in Practical Sanitary Science.

Monday, September 24.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers: Part I. Mr. John Castell-Evans on "Ventilation, Warming and Lighting," at 8 p.m.

Tuesday, September 25.

CHURCH CONGRESS.—Meeting at Newcastle (first day).

Wednesday, September 26.

CHURCH CONGRESS.—Meeting at Newcastle (second day). Mr. G. F. Watts, R.A., the Bishop of Chichester, Mr. W. Hole, Mr. Stirling Lee, Mr. E. S. Prior and Mr. Selwyn Image on "The Relation of Art to Religion."

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers: Part I. Mr. John Castell-Evans on "Meteorology," at 8 p.m. Inspection and Demonstration in the Parish of St. George's, Hanover Square, at 2 p.m., conducted by Mr. Albert Taylor.

Thursday, September 27.

CHURCH CONGRESS.—Meeting at Newcastle (third day).

Friday, September 28.

CHURCH CONGRESS.—Meeting at Newcastle (fourth and last day). The Rev. J. W. Horsley, Dr. Bowmaker, Professor Steggall, Sir T. Wrightson, M.P., and Councillor Thompson on "The Housing of the People."

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers: Part I. Mr. John Castell-Evans on "Sanitary Law," at 8 p.m.

Saturday, September 29.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers: Part I. Inspection and Demonstration at Wimbledon Sewage Works, at 3 p.m., conducted by Mr. C. H. Cooper, M.I.C.E.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

BIRMINGHAM.—For the erection of a building (for nurses, &c.) at the Workhouse, Gravelly Hill, Aston, for the Guardians of Aston Union. Mr. Cooper Whitwell, architect, 23 Temple Row, Birmingham. Quantities by the architect:—

Harley & Son	£10,962	Whitehouse & Sons	£10,121
J. & W. Webb	10,900	A. Colin Hughes	9,971
Barnsley & Sons	10,700	T. Johnson, Birmingham*	9,900
Lee & Son	10,250		
W. Harvey Gibbs	10,250		

* Accepted.

BROMLEY.—For alterations, redrainage, and repairs, &c., to Springhill, Bromley, Kent, for a school of domestic economy for the county, for the Kent County Council Technical Education Committee. Messrs. Wadmore, Wadmore & Mallett, architects, 8 Bream's Buildings, Chancery Lane, E.C.:—

F. W. Green	£1,373	Syme & Duncan	£1,110
Crossley & Son	1,339	D. Payne	1,110
Podger & Son	1,276	Arnaud & Son	1,020
R. A. Lowe	1,271	F. P. Duthoit, Bromley*	977
T. D. Graty	1,145		

* Accepted.

BURY (Lancs.).—For the erection of shops, Crompton Street, for Mr. J. Whittam. Messrs. Openshaw & Gill, architects, 6 Fleet Street, Bury. Quantities by Mr. Wm. E. Gill:—

C. Brierley	£1,510	J. Hall	£1,276
Thompson & Brierley	1,406	S. Clough	1,260
Newhouse & Son	1,400	J. Tinline, Parker Street, Bury*	1,190
J. Comfort	1,383		
Jas. Byron	1,331		

* Accepted.

CARDIFF.—For the erection of a chapel, Keppoch Street, Roath. Messrs. W. Beddoe Rees and J. H. James, architects, 37 St. Mary Street, Cardiff:—

G. Hallet	£4,750 0 0	Symonds & Co.	£4,306 7 0
Powell & Mansfield	4,559 0 0	Turner & Sons	4,245 0 0
Knox & Wells	4,500 0 0	D. Davies	4,190 0 0
J. Allen	4,467 0 0	Price Bros.	4,168 0 0
Lathy & Co.	4,387 0 0	W. T. Morgan	4,150 0 0
Evans Bros.	4,917 8 5	J. E. Evans	4,050 0 0
		Chubb & Co.*	3,750 0 0

* Accepted. [All of Cardiff.]

DEVONPORT.—For erecting the Royal Sailors' Home, Devonport, for the Committee. Mr. H. J. Snell, architect, Plymouth:—

Tozer & Son	£9,640	W. Littleton	£8,695
W. H. Lethbridge	9,460	Wakeham Bros.	8,642
Pearn Bros.	9,450	T. May	8,487
J. P. Berry	8,989	J. Partridge, Plymouth*	8,470
A. Andrews	8,888		

* Accepted.

FENNY STRATFORD.—For the erection of school buildings (new girls' school) for the School Board. Mr. John Chadwick, architect, Fenny Stratford. Quantities by architect:—

W. Wade	£4,788	Walter & Austen	£4,418
T. Yirrell	4,597	A. Taylor, Fenny Stratford*	4,360
T. T. Coleman	4,585		
A. Adkins	4,497		

* Accepted subject to approval of Education Department.

HANLEY.—For the erection of Grove Schools for the Hanley School Board. Messrs. R. Scrivener & Sons, architects, Hanley:—

Ellis	£10,799	Grant	£9,900
Longden	10,355	Bagnall	9,793
Godwin	10,085	Tompkinson & Bettelley, Longton*	9,577
Bennett	10,050		

* Accepted.

ST. GILES (Devon).—For the erection of school buildings, residence, &c., for the School Board. Messrs. Wise & Wise architects, Launceston:—

J. & H. Rich	£1,236	J. Northcott, Ashwater*	£1,200
Broad & Werren	1,225		

* Accepted.

SHIPSTON-ON-STOUR.—For the construction of a reservoir, and laying five miles C.I. mains, &c., for the Rural District Council. Mr. J. E. Willcox, C.E., 63 Temple Row, Birmingham:—

Herbert Holloway	£4,260	J. W. Lord	£3,200
H. Law	3,800	J. Jameson	2,934
Rowell & Sons	3,216	Thomas Vale	2,878

SKERRIES (Co. Dublin).—For the erection of seawater baths, concert hall, &c., for the Skerries Baths Company, Limited. Mr. Frederick Shaw, architect, 20 Laurence Street, Drogheda:—

S. Henty	£1,799	Wm. Flanagan, Skerries*	£1,447
T. Creaser	1,750	F. Gogarty	1,350
B. McDonnell	1,600		

* Accepted. † For the building only. Baths, boiler, &c., will form a separate contract.

TUNBRIDGE WELLS.—For rebuilding No. 37 and alterations to No. 35, The Pantiles, Tunbridge Wells, for the executors of the late Mr. John Charlton. Mr. C. H. Strange, architect, 16 Grosvenor Road, Tunbridge Wells:—

J. Jarvis	£1,615	Mansfield & Son, Tunbridge Wells*	£1,495
Strange & Sons	1,584		

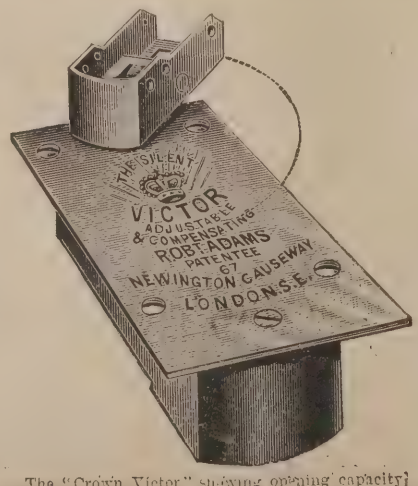
* Accepted.

WOKING.—For alterations to No. 1 The Pavement, to convert same into Banking Premises, for the London and South-Western Bank, Lim. Mr. William G. Jones, architect, Woking. Quantities by Mr. John Scott, surveyor, 23 Bedford Row, London, W.C.:—

Oldridge & Sons, Norbiton	£2,980 0 0
A. A. Gale, Woking	2,928 0 0
Whitburn, J., Woking	2,828 0 0
Greenfield, Weybridge	2,770 0 0
Potterton, Molesey	2,750 0 0
Gaze & Son, Kingston	2,739 0 0
Wheatley, Molesey	2,690 0 0
Drowley & Co., Woking	2,657 18 0
Harris, J., & Son, Woking*	2,595 0 0

* Accepted.

WOLVERHAMPTON.—For rebuilding the Red Cow Inn, Wolverhampton. Mr. R. J. Rowe, architect. Quantities by Mr. W. Webb:—



Tildesley	£1,187	Skett	£1,150
Herbert	1,185	Gough	1,120
Morrell	1,170	Cave*	1,098

* Accepted.

PERFECTION IN Spring Hinges

The "VICTOR" Double Action Spring Hinges open wider than any other—viz., 135° each way, *i.e.*, 45° beyond right angles—and close with a perfect check action.

ROBERT ADAMS,
PATENTEE,
65 & 67 Newington Causeway, LONDON, S.E.
Telegrams: "ROBERT ADAMS, LONDON."

The "Crown Victor" showing opening capacity.

PERFECTION IN Spring Hinges

The "VICTOR" Single Action Spring Hinges open wider than any other—opening to and closing from the angle of 180°, *i.e.*, the half circle, with a perfect check action.

An Architectural Causerie.

Ravenna: its Connection with Early Christian Art.

Of all the great cities of the Roman Republic and of the Holy Roman Empire few have dropped back into an oblivion so absolute as the ancient city of Ravenna. It is true that Ravenna occupied only for a short period her proud position as the centre of government, yet that short period of active participation in the administrative affairs of the Empire invested her with a permanent interest. Ravenna's part in the affairs of the world—for the Empire practically comprised the world then—was not a very dignified one. It was a place of refuge for Consuls fleeing from Alaric and the Goths, and at the time of the fall of Rome in A.D. 410 Innocent himself, Christian Bishop of Rome, found refuge there. The Court was held sometimes at Milan, sometimes at Ravenna, but the interest of Ravenna for us lies in the fact, that it entered into the political and religious arena when Christianity—at war with Paganism—finally broke down Pagan beliefs; establishing itself as first spiritual and temporal power over Eastern and Western Empires. World-wide events such as these cannot but affect a city in its entirety, and I wish to trace here the effect upon the art of Ravenna nearly fifteen centuries ago.

That we are able to do this is extraordinary enough, but the explanation is that the tide of Roman government swept onward and eastward to Constantium—Constantinople—leaving Ravenna in the backwater of political and religious dissension, where it has lain fallow all these centuries. When once the power temporal and the sway spiritual left Ravenna, it no more partook prominently in the affairs of history, but lay wrapt in the mist of its rice swamps, secure from molestation, and secure also from those grosser acts of vandalism which have left such sorry marks upon other and more prominent cities. Augustine's work after the fall of Rome finally rang the death knell of Paganism as a religion; as a spirit, with disciples among the mixed population of all the various races in Italy, it still existed—so much so that officials of the Christian Church held Paganistic ideas, and even practised to a limited extent Paganistic propaganda, and it may be said that in the fourth century Paganism ran like a strong undercurrent beneath the wide-spreading flood of Christianity. This can be plainly seen in the few examples of fifth-century art still left to us in Ravenna. Art at this time, it must be realised, was Christian, and decidedly Anti-Pagan. In fact, the art of the time became often mere vandalism, for it occupied itself with altering shamelessly the noble temples and edifices, centres of Pagan worship, into places for the practice of Christianity. Not in the whole world-history of art can there be found a more paradoxical position than this. The Christian community was producing and carrying forward all the artistic life and movement of the time, yet entirely and strongly in opposition to the Pagan section of the community, whose inheritance this art was by right of descent. Christianity had no artistic history, no art ideals or precedents to build upon for itself; it was too young a growth for this. Therefore, to make any progress in art at all, it had to do so through the hated channels of Paganistic culture; yet the intellectual and educated Christian could not but endorse the Pagan standard of beauty and artistic excellence handed down from those Pagans of Pagans the ancient Greeks.

The fifth century was a time of intellectual anarchy. Most of the old Roman families were split up in some way by the entrance of this new religion. People were concerned more about the safety of their souls than the beauty of their buildings, and logically the art of that time suffered accordingly. Christian artists wrought by Pagan standards with not so much faith in their efficacy as did the artist aforetime, and with some doubt as to their morality. Thus the early Christian Art is undoubtedly degenerate and somewhat debased because of its want of faith, yet it could not fall far, inasmuch as the vigour and spirit of the new religion animated it and made it live. It has never been claimed, I think, that the Renaissance ever approaches the glory and spiritual beauty of pure Classic Art. The Renaissance seems rather the outcome of the despair of a people who realised that never could they gain such a secret of form and excellence as the Greeks possessed, and so made what progress they could with their stock of ideas. The great movement of the Renaissance *was* great because of its resumption of pure standards and high ideals of beauty for the debased ideas of the Middle Ages; yet the Renaissance is inferior to the Classic, and immeasurably so. This is stated in order to draw a parallel between the late Italian Renaissance of the seventeenth century and the Christian Art of the fifth. In Ravenna examples of this early Christian Art are to be seen existing to-day in mosaic, in marble fretwork of exquisite finish, and marble bas-reliefs. Some are in a perfect state of preservation, and—here lies the interest—it would demand the discernment of a specialist in the Italian Renaissance to tell which was the fifth century work and which was the seventeenth. This is partly due to the wonderful state of preservation that the Ravenna examples are in, but it is a most nteresting parallel that the Christian Art of the fifth century, which we accepted before as a form of debased Pagan Art, a sort of debased Classic Art, should so strikingly resemble the work of the Italian Renaissance at the zenith of its power. This proves what we already know, that the Renaissance was a harking backward to Classic ideas which it could not completely realise.

I know of no other place where such a comparison can be made. Little fifth century art of any kind is handed down to us to examine, but Ravenna, like the ghost of its former glory lurking among its wet rice swamps, supplies a link in the history of art which cannot be overestimated. The comparison fails only in the composition of figure, where the fifth century mosaic falls short of the noble conceptions of form brought forth by the Italian Renaissance. Explanation of this is to be found in the attitude adopted by the early Church towards art. It regarded that absorbed sensualism of the Greeks in beauty as something immoral and to be suppressed. This temper can be traced to the Church even of the thirteenth and fourteenth centuries, when Fra Lippo Lippi was told by the worthy bishop that he was not to seduce the minds of the worshippers by painting beautiful saints dangerously like the cardinal's niece, but by picturing a ghastly suffering and contorted form to lead their minds to martyrdom.

KINGSTON RUSSELL. DRAWN BY C. G. HARPER.

The Baptistery of Ravenna is a building of absorbing interest. It contains art work of undoubted fifth century origin, and a mosaic almost unique in historical, religious and artistic interest. The mosaic referred to is within the dome of the Baptistery, its colours but little faded, although fifteen centuries old. The subject is the Baptism of Christ by John the Baptist, a brilliant and striking conception of figures. That of Christ is rising half out of the water, and to the right is the figure of the Pagan river god riding on the waves and seemingly presiding over the ceremony. Here you have proof of the undercurrent of Paganism coming to the surface indeed. The artist must have been Christian, the worker Christian, and the building Christian, yet unconsciously a poetic idea of Paganism springs right up amidst such alien surroundings. Ravenna, shrouded with its damp malarial mists, silent and solitary in the middle of its swamps, with its quaint prison and begging inmates, its ancient history and its intense age, is literally a ghost of the past. It represents and reproduces the thoughts, the ideas of an age almost unimaginable, of an art almost forgotten; but it is also the sign of what once ruled the whole known world, though long since sunk in the sea of ages—the Holy Roman Empire.

F. B.

The Home of the Russells

THE old home of the Russells, Dukes of Bedford, has lately been put in order, and thus bids fair to last another few hundred years to mark the spot whence that family took its rise. The old Manor House of Kingston Russell is not indeed the original residence, having been rebuilt in its present style about two hundred years ago, after the fortunes of the house were assured. Kingston Russell is in the West Country. As the traveller down the old highway to Exeter passes Dorchester and makes for Bridport he enters upon a wild district of bleak and windy downs. In sharp contrast with these inhospitable heights are the deep coombes where the primrose blooms early and frosts come seldom. In one of these gardens in the wilderness is this successor of the original farmhouse, which still belongs to the Dukes of Bedford, whose ancestors were seated here shortly after the Conquest. Deep down in this retired spot, away from all rumours of the outer world, this lonely mansion stands with no neighbours save farmsteads. On this spot the Russells were anchored for very many entirely undistinguished generations, until mere chance brought them into prominence, fame and fortune.

The Rozels, as they were originally, like many other Norman filibusters, came over with the Conqueror, and history passes them by from that date until 1506. For all those centuries the Russell genius for getting on lay fallow, and none of them did anything in particular. They just vegetated on their lands in Dorsetshire, at Kingston Russell, near Bridport, until that year, when a quite unexpected happening put the beginnings of promotion in their way. John Russell, the heir of the bucolic head of the house, had just returned from Continental travels, and had acquired both polish and the command of the French, Spanish, and German tongues, which accomplishments would probably have been of no sort of use to him had it not been for the singular happening already referred to. In the winter of that year the Archduke of Austria, voyaging from the Low Countries to Spain, was driven by the fury of the Channel gales into Weymouth. He was unromantically seasick, and landed, although England at that time was no safe place for one of his house. At any rate, he preferred the prospect of political imprisonment to the unkindly usage of the seas. Meanwhile, he was sheltered by Sir Thomas Trenchard, of Wolveton, until the King's pleasure became known, and because Sir Thomas knew naught but his own native robust English tongue he had his young kinsman, John Russell, over from Kingston Russell to explain and entertain. This he did with so much address and courtliness that when the Archduke visited Henry the Seventh on a friendly invitation to Windsor, where, instead of being clapped into a dungeon, he was royally entreated, he spoke in such high praise of this young Englishman that the King speedily found him a position in the royal household. Thus was a career opened to this most fortunate young man. He was with Henry the Eighth in France, and fought in several battles, losing an eye at the taking of Morlaix, and at the same time gaining a knighthood. Diplomacy, which rather than fighting is the Russell *métier*, soon claimed him. Diplomacy, it is well said, is the art of lying for the advantage of one's country. Perhaps he had not learned the art sufficiently well, for his great mission to the Continent failed, and he returned, not to disgrace, but, with the inevitable Russell address, to preferment. The times were fatal for honest men. That Russell survived them and died in his bed in the reign of Mary, at peace, ennobled with the title of Earl of Bedford, and enriched with the spoils of confiscated religious houses and the lands of attainted and executed friends, is therefore no recommendation of his character, which was that of a cautious time-server and cunning sycophant. He lies, the founder of his house, in the Ducal Chapel at Chenies, in Buckinghamshire, his recumbent effigy beside that of his Countess, who brought Chenies into the family. It is a magnificent monument, and the figures evidently careful likenesses, even down to the detail of the Earl's eye-lid, it being represented drooping over the lost eye. C. G. H.

On Reflection.

Yerkes.

Two leading London half-penny dailies are disputing over the report of a scheme for a new "tuppenny tube" in, or rather under, the metropolis. The "Daily Express" ushers in Mr. Yerkes, the American railway magnate, who, backed with American dollars to the tune of £4,000,000, is going to show the "darnation Britisher" how to run suburban traffic. The "Daily Mail," perturbed by this scoop in Transatlantic journalism, opines that this is Wall Street fiction of the penny plain and twopence coloured order, intended strictly for home consumption. Exactly why Mr. Yerkes should wish to engineer railway enterprises in England when the "virgin tracts" and the "bounding prairies" (we think these terms are correct) of his own, his native, land are open to the machinations of his fertile brain. But, presuming (only presuming) that Mr. Yerkes desires to show us the wonders and delights of American railway enterprise, why, oh why, does he select the one field which is already fully occupied? The Waterloo and Baker Street Railway, with its extension to Hampstead, seems to us to already cover pretty fully the ground which Mr. Yerkes proposes to traverse. If Mr. Yerkes had suggested a line from the Bank along Queen Victoria Street, Cannon Street, Ludgate Hill, Fleet Street, Strand, Haymarket, Piccadilly Circus, Piccadilly, Brompton Road and Fulham Road to Putney Bridge, he would have initiated an enterprise worthy of every Londoner's support. At present we will wait and see if the "Express" prognostications turn out to be correct. We have heard of Mr. Yerkes before, but his pose last time was tramways. Well, we do not want any more tramways, and especially overhead electric tramways. They are sometimes dangerous, always unsightly, and help to congest our already overcrowded streets. The new electric railways have shown us that we can dispense with them, and the mad municipal tramway schemes of the L.C.C. will, we hope, receive a salutary check. While private enterprise will take passengers such distances as from the City to Stockwell and the City to Shepherd's Bush for 2d., there is no need to load the overburdened ratepayers with the cost of out-of-date municipal monopolies. The advent, however, of Mr. Yerkes would bustle things, and London requires it. We guess the underground tube line has arrived, and we wouldn't do a thing to that scheme of Mr. Yerkes. We hear the derisive onlooker jeer at the passengers "jerked through the tuppenny tube"; but in future the passengers will be "yerked."

The Worth of Congresses.

CONGRESSES have been plentiful of late: we have had the Trades Union Congress at Huddersfield, that of the British Association at Bradford, and the Sanitary Congress at Stirling, to mention only three. The question is therefore opportune—Do these meetings effect any good, or are they mere gossipy gatherings promoted for the benefit of the few who can afford to attend them? Before attempting to give an answer it would be well to state what is the professed purpose of a congress. It is convened, firstly, to consider the progress being made by the particular section of human effort with which it is connected, to allow an exchange of views between leading men and a discussion to take place; and, secondly, there is its social side, by which its members are enabled to enjoy that personal knowledge which exerts so powerful an influence on all affairs. There are those who declare in connection with the British Medical Association that the newly-qualified are caught young with the prospect of sharing the advantages of the Association for a guinea a year, with the weekly journal thrown in: in a few years comes the awakening—there is the journal, but where are the advantages of the Association? A writer with the same feelings says that we read papers on the glorious art of architecture which is ours. "We go home flushed with applause, palpitating with delight, our heads brushing the stars, and, without one thought of the absurdity of it all, go on with our work as artistic middlemen, hurriedly imposing our half-baked ideals on workmen who would do better work if we left them alone." But for all that we do not think that meetings and congresses are so much waste of time. They do improve many who attend them, either by restating half-forgotten principles or by supplying new facts about practical current subjects; besides which, it should be remembered that nowadays the newspaper is all alive, and despite its many deficiencies it remains the text-book of the people. See, for instance, what space has been devoted to the papers read at the congresses mentioned above. Has this had no effect; does it not tend to create an interest in the general reader which prompts him to appreciate something he took no notice of before? And, extending this argument to the technical press, where fuller reports are to be found, is it not surely a benefit that those who were unable to be present at the delivery of a lecture are thus enabled to learn exactly what was said and done? It is not the fault of the system if individual members there think fit to give utterance to high-flown ideas or to sentiments which they do not embody in everyday practice. Then there is the social side, when we see the gods without their halo, when philosophers become gallant. A good example of the popularity of this feature was to be had at the last General Architectural Congress, for, while the professional meetings were very thinly attended, on the opening "ladies' night" the Institute's room was crowded. This was not right, because the first object of the Congress was a professional and not a social one, and it would be more satisfactory if this fact were observed more generally. But to make a wholesale sweep of congresses and meetings is certainly not justifiable, as, if properly conducted, they should be the outward and visible record of current thought and progress. Faults they have, to be sure; they can be remedied; but this is no reason for destroying the whole.

To-day's Street: to-morrow's Slum.

PARTICULARS will be found on the "Bricks and Mortar" page this week of the new town in course of erection outside Manchester, and these particulars are sufficient to throw a little light on what pure speculation and "commercial progress" can do and may be the cause of. The Trafford Park Company, from all accounts, is carrying out a scheme which cannot be too strongly condemned. Mr. E. T. Hooley bought the land in Trafford Park, and the company acquired it from him; now they are putting up a batch of factories and about fifteen hundred houses as fast and as cheaply as they can, and there seems every possibility that in a few years the district will have all the attributes of a slum. There will be no gardens, no trees, no grass; merely a mass of bricks and mortar, mud and crying children, drunkenness, cursing and the concomitant evils of lower city life. One does not want to paint too black a picture, but the facts are so ugly that the worst is feared. Humanity handed over to the merciful care of a rent-earning speculation and a manufacturing extension will have a hard time of it. The Dwellings Company have to make the scheme pay somehow. That is the sole object; but unless things are conducted in a little more humane way than they have been commenced Trafford Park will be another addition to the deplorable list of slum districts.

AIR-TIGHT CASE MAKING.*

By W. T. SWEETT.

FOR some years there has been forming quite a new branch of trade, that of air-tight case making.

In all the joints of doors and glass of show cases, window enclosures, &c., the interiors of which are to be air-tight and yet easily accessible, it is necessary to have perfect truth of surfaces and a minimum of friction. Air-tight cases may be divided into two classes, namely, exhibition cases (being cases which are very rarely opened after the exhibit has been enclosed) and shop show cases (those in which a shopman displays his wares).

It is very rarely that any system of tongues, or hooks, is used in the joints of the doors of exhibition cases. These doors are usually shot into a very close joint, so close in fact that the two surfaces touch one another, causing a considerable amount of friction when opened and closed. A velvet pad is placed in the rebate in order to make the joints perfectly air-tight.

In the second instance the cases required by the shopkeeper must necessarily be made air-tight by something more substantial than velvet; so that, almost without exception, these cases have an arrangement of tongues, &c., which will be described later.

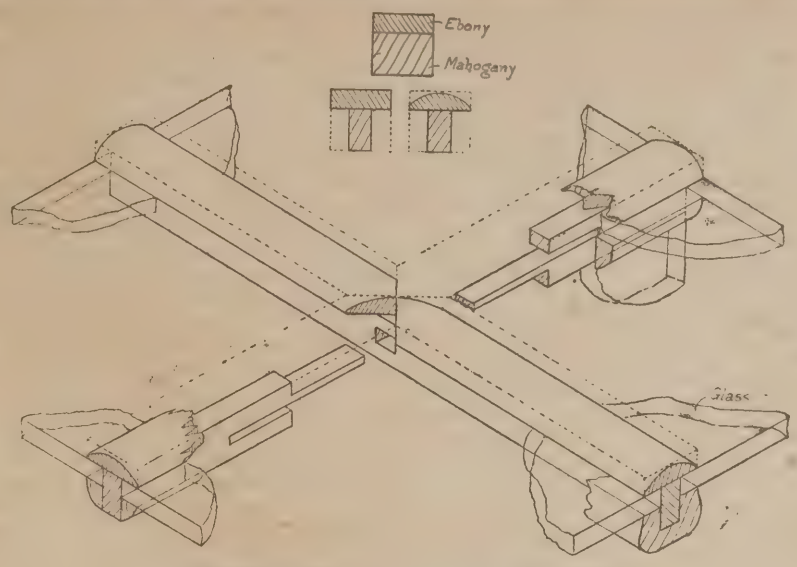
In designing show cases the great aim should be lightness of material, causing the least obstruction to a full view of the interior.

The majority of cases made by men not adept at the work are displeasingly substantial in appearance, for it is astonishing what strong cases and doors can be made with frail framework carefully glazed. Exhibition and show cases generally are known by the following names:—

Wall Cases.—These have their backs, and sometimes their backs and ends, to the wall. When two cases of the same size are to be fixed back to back they should be of the wall-case type, the doors being in front.

Centre Cases.—These stand in the centre of shops, about exhibition floors, &c., so that the public can get all round them, the means of access being kept as nearly secret as possible (some of the devices employed will be dealt with later).

Table Cases.—These open at the top and are of the height of tables, and, as tables, stand upon legs. They are usually very shallow, the interiors being viewed from above. The table case is also made with the top leaning towards a ridge, sometimes very steep and sometimes very flat, but invariably placed so that the interiors are viewed through the tops and access obtained by raising the tops, which are hung to the ridge. The ends of these cases are sometimes hipped and sometimes of the gable or spandrel type. When table cases are made to fix against the wall they are known as wall table cases.

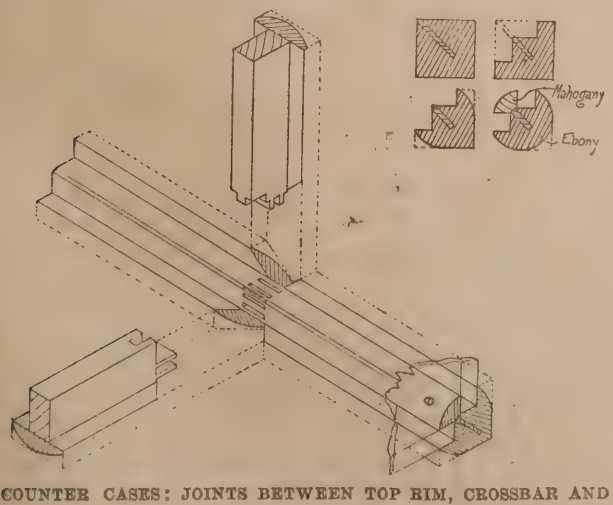


Counter Cases.—As their names imply, these act as counters when placed upon the under fittings and counter front. They have clear glass tops and risers, and are usually between 9in. and 12in. deep, with a width varying from 19in. to 27in. Access is obtained by the shopman from behind. The rim of wood is of the smallest dimension, never being more than $\frac{3}{4}$in., but usually $\frac{5}{8}$in., round, and generally polished black. When the cases are to be polished black, the top rim, even in the most common kinds, should be of ebony, as by the continual wear caused by serving a stained deception very soon reveals its secret. Counter cases are made with square and semi-circular ends, and are not usually more than 14ft. long. When a greater length is required, two or more cases are butted together, the joints being kept in position by dowels in the base. As the accompanying details show, the work required will try the patience rather severely.

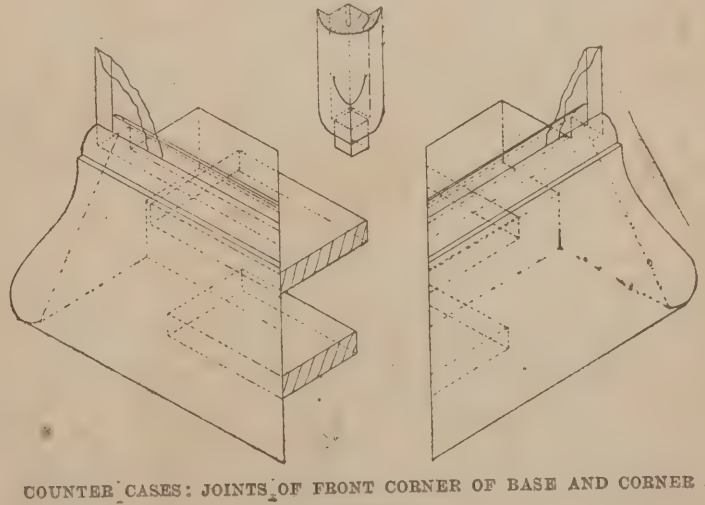
Air-tight Drawers, sometimes air-tight in themselves and sometimes placed in nests in air-tight cupboards, also come within the scope of this paper.

Pedestal Cases.—These are usually of the centre or table-case type, and instead of being upon solid low bases or legs are placed upon pedestals, bringing the bottoms of the cases up to a height of about 3ft. or 3ft. 6in. The pedestals themselves are generally used as cupboards or for nests of drawers, &c.

Window Enclosures.—These are composed of doors and frames fixed to the back of the stall board, an air-shelf extending from the enclosure frame to the window, which is usually only in front, though it is sometimes at the front and one end, and occasionally at the front and both ends. The ends not bounded by the shop windows generally have splayed mirrors set at a good angle, to give the spectator the impression of a double stock. Now as to the



* A paper read before the meeting of the British Institute of Certified Carpenters held on August 4th, 1900.



COUNTER CASES: JOINT OF TOP CROSS BARS.

Methods of Construction.

First take the wall case before described. There can be no limit to the size of this form of case. It is not usual to make doors (or sashes as they are sometimes incorrectly termed) more than 2ft. 9in. wide. Everything is planed up and set out in the usual way, but the first parts to be glued up must be the doors, all attention being given to the squaring, &c. The frame is then fitted up, all the tenons being made $1\frac{1}{2}$in. longer than the width of the stiles or rails, as the case may be (excepting when the case has a finished end). A hole is mortised through the tenons beyond the frame, in order that a wedge may be driven through to act as a key, or draw bore pin, to draw up the shoulders. The whole frame is put together in this manner, and is afterwards cleaned off flush on the back side, the sashes also being cleaned off on the back side and carefully shot to size. The frame is then taken to pieces and the single- or double-grooving plane (whichever is to be used) is stuck in the edge from the back side of the hanging stiles of the frame, and tongues are glued preparatory for the double hollow. Then the single square-grooving plane is, in every instance, stuck from the joint on the back side, preparing a groove for the air fillets on the top and bottom rails of the frame. These fillets are next glued in. The doors have a hollow worked in the back at the top and bottom with the single round plane, working from the joint, the hollow also crossing the stiles. The hanging stiles of the doors have the single or double hollow worked with the single or double round from the back of the stile. The closing joint should be that known as the hooked joint. To prepare this, first shoot the stiles to a bevel set at about 85 deg.; rebate with a side fillister to remove the bulk of waste wood, and then

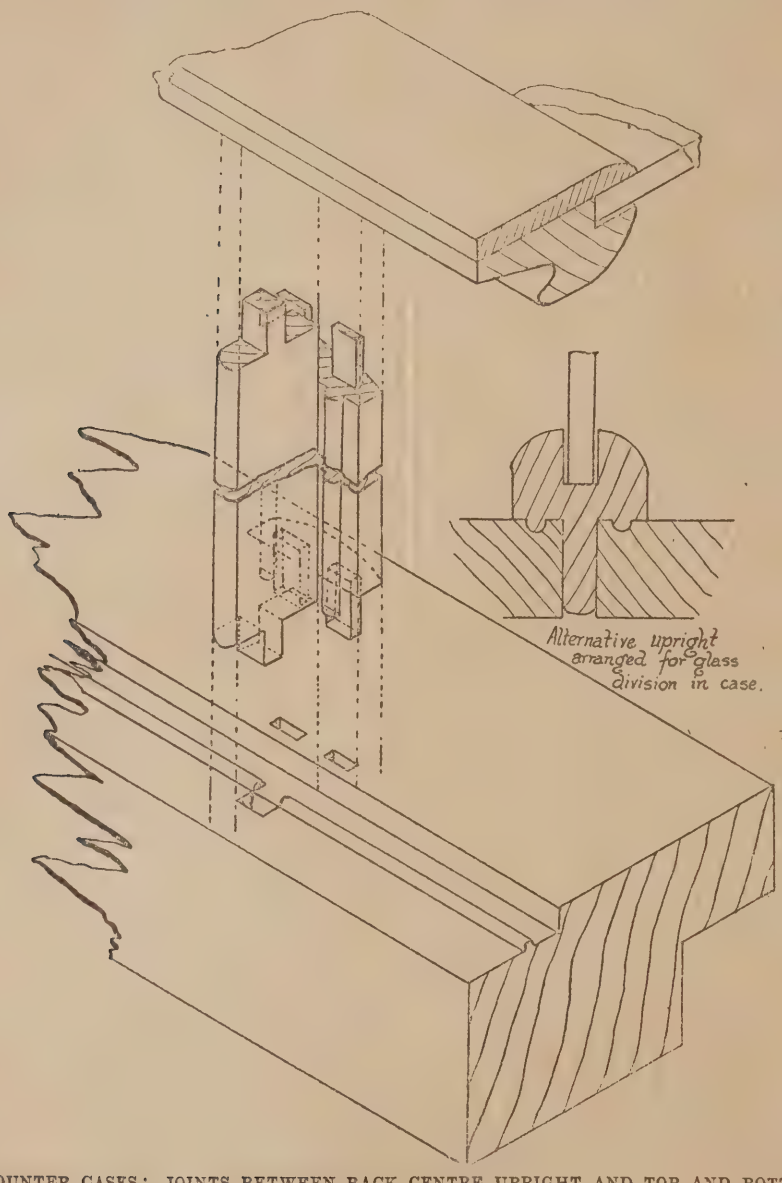
COUNTER CASES: JOINTS OF FRONT CORNER OF BASE AND CORNER UPRIGHT.

with the hooked-joint plane finish working the joint. The plane should be previously set by trial on two spare pieces of stuff. The tongues on the hanging stiles of the frame require to be finished. This is done with the single or double hollow, working from the back side as before. From these remarks it will be understood that all planes for air-tight work, whether single or double, must be "matched."



The butts are now let in and the doors hung to their respective frame stiles. The butts are let in to depth by a specially prepared template. A single-tooth gauge is employed from the back side of the doors and frame to mark for the edge of the butt flange.

Having hung the doors, note that all joints fit correctly, and then prepare to glue the frame. To do this, unscrew the butts and put the frame together as before and key up, put in the doors, the butts being placed in their places, though not screwed, slack the keys and glue up the frame, using the keys only to pull up the shoulders. Wedge the frame up very carefully, as much depends upon how the wedging is carried out. It is very easy to wedge too hard and bind the doors, or too lightly and make the carefully prepared joints ineffectual for excluding the air.

To control the wedging to a nicety, place the fingers under the rails of the doors, top or bottom, at the shutting joint, and the thumbs on the rail of the frame outside; by this means one can, by gently pulling the door, determine whether the wedges are binding the joints too hard or causing the frame to pinch the doors cornerwise.

The frame should be wedged to the doors until these are just too tight to work easily, the tightness being afterwards remedied by glass papering and rubbing the joints with French chalk. It will now be seen that the doors must be glued up first, all joints being stuck from the back side, which is the flush side, and being fitted up before the frame is glued. The front of the case may now be considered complete, as it only requires cleaning off.

Now to consider the carcase. The top, bottom, and sides of the case are housed together, the sides having tongues worked on them to be received by the front, and the top and bottom resting on fillets. Having glued and screwed the carcase to the front, attention is next given to the back, which must be made air-tight carefully. Canvas is stretched across the case, struts having been previously put inside to prevent the canvas bending inwards.

COUNTER CASES: JOINTS BETWEEN BACK CENTRE UPRIGHT AND TOP AND BOTTOM.

After thoroughly fixing the canvas, the match-lining is nailed on to form the back; then the whole of the inside of the case is lined with strong lining paper, turned at the angles to cover the joints. The bottom is usually covered with cloth, the backs and sides lined with mirrors, and the top papered.

With just a word about glazing I will leave wall cases. The plates glazing the doors are bedded on very thin putty, and the glass is packed on strips until the door is kept by the glass in the exact place where it was fitted. The glazing fillets are then fixed in and the minor details—such as cleaning off, fixing fastenings, cornice, plinth, &c.—having been attended to, the case is complete.

The other cases—table cases, centre cases, &c.—are constructed in a very similar manner so far as making the frame to fit the sashes or doors is concerned. The doors of centre cases, which have to be as nearly secret as possible, have no butts, but lift out as shutters, the form of joint usually being on the velvet-pad system. They are sometimes fastened in by four locks, two on each side, and sometimes by two dowels in the bottom and two locks at the top.

I will now pass on to counter cases, which may be considered to be the most intricate to make.

The first part to be made is the top rim, which is glued up. The next to be fitted and glued up are the base rim and bottom panelling. The uprights are then fitted into the top rim and base and the case is ready to glue up. It is now to be glazed. To do so turn the case upside down, the top rim being on the bench and held by straight-edges. The putty is made very thin, and the top plates are the first to be firmly bedded; next the riser plates, then the glazing fillets are screwed in place, and finally the case bottom is screwed up. After this the case is turned upon its base, when the flaps are fitted and hung and the case cleaned off for polishing. The interiors of the cases are usually fitted with trays, their rims being fixed to their bottoms by pegs, which can be cleaned off and ebonised with the rims, which are usually of American walnut. This produces a fairly cheap and satisfactory tray. The bottoms are usually finished by covering them with cloth.

When the case has circular ends the top rim for the end is built up laminated by means of three strips of black walnut and one strip of ebony, bent round a shaped block; after being cleaned off, a cover-piece of ebony is glued on the top. The rim end is then ready for fitting and working.

All the fitting to the counter case is done with the ebony left flat, the rounding, or lipping as it is called, being done after fitting and before glueing up. The bottoms of these cases are usually of 1½in. white pine and have 1in. flush panels. After cleaning off they are very carefully covered on the top or flush side with calico, being afterwards lined with paper and blacked.

DECORATION AND FURNISHING.

II.

By FRANK MURRAY.

(*Continued from page* 97, No. CCXCI.)

IN undertaking to give any useful practical hints on decoration and furniture it would be advisable to attempt some sort of definition, in order to limit each area. At the outset such a definition is beset with difficulties; the two are so intimately associated that to draw a precise line of demarcation or to specify very exactly the frontiers, is not easy.

Let us take up decoration first, and define it as follows:—Decoration shall mean the application of colour, material, or relief ornament, and shall be limited to the treatment of pre-existing architectural features.

The work of the decorator commonly covers a much wider field—the remodelling of all the apartments in a house, the introduction of new constructive features, &c.; but for the purpose of this paper it must be supposed that all constructional work is complete, and that the services of the "building" artisan will not be required.

It remains, therefore, to deal with the application of colour and ornament, and the selection of material for wall or ceiling covering if painted decoration be not used; also the consideration of how far the style of the general scheme should be influenced by the existing architectural features.

It is at this point that we discover the intimate union between decoration and furniture, and how the region of the one overlaps that of the other. Into which division of our subject, for example, should the floor-covering of a room come? It is the counterpart of the ceiling, and very often of far greater importance in a colour scheme. An authority of no mean standing used to begin his decorative scheme invariably by selecting his carpet.

In a paper of this nature, however, it does not do to be too nice over distinctions, therefore, putting on one side doubtful points, let us split the subject up into two principal subdivisions, which may be considered in order

thus:—(1) Considerations of style to be adopted in relation to the architecture of the building treated. (2) Colour schemes and materials to be used in the decoration of surfaces and the treatment of light apertures, such as windows, skylights, lantern lights.

Style.

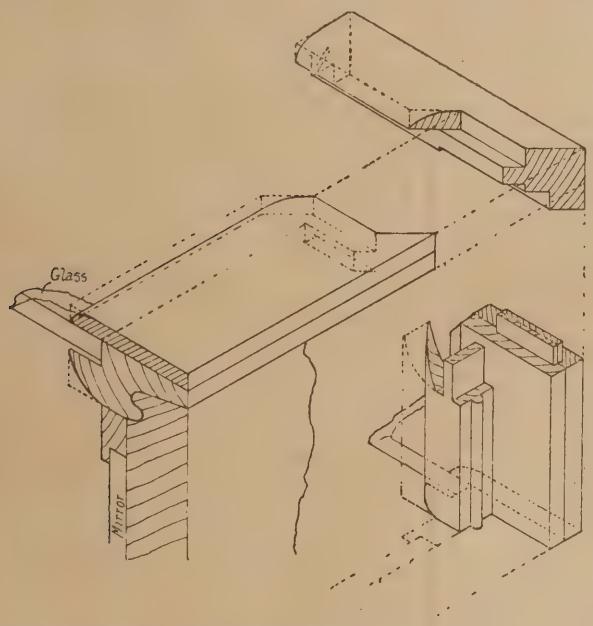
Subject to two general rules, the greatest possible latitude should be allowed in style. There is one which I think of universal application—the style used in the decoration of a building, if it be a defined one, *should not be of an earlier date than the building itself.*

Given the main constructional features of style in a building, a legitimate effect can never be produced where the decorative detail is not in accord with the architecture of the building. One cannot insist too strongly upon this point of cardinal value; the main architectural lines of a building invariably dictate the style. The most beautifully-drawn and harmoniously-coloured detail has no value in comparison with the lines of architectural construction.

It is quite useless to cover a ceiling of Renaissance contour with Oriental detail and colour; the architectural lines will always dominate, and the ceiling will remain Renaissance to the end of time. With those styles that have architectural features in common the greatest possible latitude may and ought to be allowed, always within the limits of natural development in point of time. It is not, for instance, worth while to insist that the ornament of a fourteenth-century building should be of that period; indeed, an additional interest grows out of diversity, and we may well apply to the mouldings and wall surfaces of a very late Gothic the character and colouring of the Transition Renaissance.

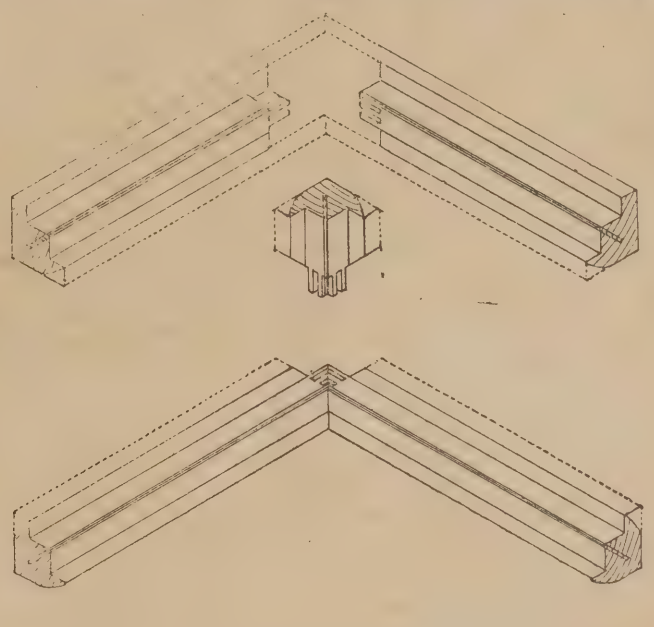
The selection or choice of any one of the numerous styles is, obviously, a matter for individual preference, yet it may perhaps be as well to set down a few hints which might not occur to anyone dealing for the first time with the subject of decoration.

Firstly, then, I would say that all the styles have some typical character or expression which renders them most satisfying in certain situations.



There is an obvious inappropriateness in using the characteristic details of an Egyptian temple in a modern room. The sixteenth and seventeenth century Renaissance styles seem particularly suited for domestic interiors, and those from the tenth to the fourteenth centuries find a more fitting place in large public buildings of either secular or ecclesiastical character. The eighteenth century is rich with styles developed from the Roman, which can be applied to either public or private buildings. The weight and boldness of Georgian, for instance, find a fitting home in some municipal building, whilst the exquisite detail and Italian delicacy of the Adams style can be appreciated fully in domestic interiors.

Let us here say a word or two on the vexed question of style. There is at the present time a confusion of ideas as to what "style" really means. Definitions are always difficult and proverbially dangerous; it is, therefore, with some temerity that one attempts to define "style," yet until one has formed some distinct idea on this subject, to write about it only makes confusion chaotic. Style in decorative art would seem to be the developed expression of the ruling ideas of the time through the medium of pre-existing decorative types.



The constructive materials accessible—the habits of the people—sense of colour and form—mental appreciation of Nature and its beauty—sense of harmony in proportion, and a thousand other things, expressed through the medium of certain general laws, give a character and quality to work typical of the race and its attributes at the time of the production of the style.

The physical character of the country, the incidents of war or peace, even the personal qualities of the rulers, find an expression in style. The Empire Style, borrowed from the Imperial days of Rome, is obviously the artistic response to the Imperial idea of the later Republic in France. The decorations of the epoch of Louis XIV. are the true complement of the social conditions of the time, and recall a grandiose rather than grand phase in art; the style of Louis XV., in the unchecked license of its line, aptly expresses the period which gave it birth. It is needless to multiply instances; everyone will recognise the truth of the proposition.

Many are asking for a new style—there never was and never will be a *new* style, any more than there will be a new cloud, mountain or tree. The slowly changing conditions and ideals of life among the diverse races of mankind will differentiate styles from the old types, governed always by the force of the everlasting laws of construction and harmonic proportion in form and colour.

Applied Materials.

Perhaps the last decade has seen a greater development in materials and designs for wall coverings than in almost any other branch of decorative art, and one might be led at first to believe that we have discovered many new applications of industrial art hitherto undreamt of. A little examination will soon dispel these ideas.

"The invention of velvet-paper," John Beckmann tells us in his "History of Invention," is by several French writers ascribed to the English; and if they are not mistaken, it was first made known in the reign of Charles I. On May 1st, 1634, an artist named Jerome Lanyer received a patent for this art, in which it is said that he had found out a method of affixing wool, silk, and other materials of various colours upon linen, cloth, silk, cotton, leather, and different substances, with oil, size, and cements, so that they could be employed for hangings as well as for other purposes."

The earliest wall coverings that we find records of include arras, painted leather, and painted cloths, stencilled materials, modelled low-relief plaster.

Leather paper is used very largely at the present time, and there is no reason why it should not be ranked as a just decorative material if a rich and harmonious colour effect can be produced on a paper background. The fact that leather was originally used as a ground or foundation in the preparation of a decorative material by the addition of low-relief ornament, colour, and gilding, constitutes no æsthetic argument against the use of paper on other material as a ground for the production of the same effect.

Beautiful textures of every dye are now economically produced, and can be used plain or with coloured decorations painted or stencilled on them. The dyed linen and jute canvases from Scotland are an instance.

Woven fabrics, printed chintzes, arras cloths, are largely and properly used, and some of the most exquisite effects attained thereby. Brocade patterns, in mixtures of silk, cotton, and linen—even the much unjustly maligned jute—give some very good results used as wall coverings, either closely applied with adhesive material or strained on frames in panels. Wallpapers demand almost an article devoted solely to this one subject, so extensively are they used, so wide the range they cover.

The invention of the paper machine has effected a great change in paper-hangings; any lengths of paper can now be obtained, whereas formerly they could only be printed upon separate sheets, which naturally rendered them extremely inconvenient to print as well as to apply to walls. Any remarks upon the countless designs for wallpapers now in the market must be reserved for another opportunity, as the subject is far too large to dismiss hurriedly.

Painted Decoration.

Tempera was the earliest method of applying colour, and is still largely used, and the result is very satisfactory. As regards price, it is quite an inexpensive method to employ, and, in good atmospheres, more artistically satisfactory than oil paint.

By using tempera one can obtain that subtle softness and velvety surface which is the lasting delight of the artist.

Oil paint is more costly, but undoubtedly more lasting. Where the surface is exposed to any wear, or where great depth and richness of colour are needed, it is distinctly best to employ oil paint. There is no reason why both tempera and oil cannot be used in the same scheme of decoration; should it be sufficiently large in scale, there will be found an appropriate place for each.

One need not more than allude to such forms of decoration as fresco, water glass, or encaustic painting; both the cost and difficulty of working put them out of the scope of ordinary decorative material. Possibly at a later date these methods may be more fully dealt with; for the present, one is compelled to merely mention them. Sgraffito is an effective means of wall decoration, relatively costly, but always worth keeping in mind. The main difficulty is to get capable handicraftsmen for these special developments when wanted.

Avoid cheap ornament; the cheaper the ornament the more sparingly should it be used. At the present time we are suffering from a plethora of cheap ornament.

Restraint in both colour, form, and ornament should be the keynote in any scheme of decoration; already we notice with gratitude the marked tendency in that direction in the present revival of the arts.

Wood panelling can hardly be said to come inside the scope of decoration, but a word or two, perhaps, may be given to it. There is a great deal to be said on the subject of painting pine panelling, and *appliqué* mouldings on a flat surface. These treated in the subdued tertiary tones of wood give a great range of decorative effect; it is even admissible, and often produces a beautiful effect, to paint such work in full rich tones. One has seen with the greatest pleasure a deep, rich, bright green, orange, and even bright red. That these latter colours should be applied with great circumspection and care goes without saying, but when thought and judgment have been exercised it is equally certain that the happiest effects can be obtained by their use.

Very little use is made of glazes—thin semi-transparent colours lightly brushed over opaque grounds below. These should be much more widely applied in decorative work; their effect is very rich, and gives a high artistic finish and completeness; many of the finest effects in colour are attainable in no other way.

Much may be done with transparent stains applied to the natural wood. America is in advance of us in this respect, and one ventures to think that we shall see a greater improvement in the use of stained woods in proportion as Englishmen become more accustomed to the possibilities of which Americans have already taken full advantage.

By transition we come to graining. A great deal can be written for and against graining. One cannot pretend to enter into the discussion here; that to which Ruskin has devoted a page of earnest reprobation may not be dismissed in a sentence. One may remind those who object to graining that the same argument applies to the use of scagliola. One thing is certain, which is, that there is no æsthetic canon that ought to deny one the right to use colour in such a way as to obtain the quality of rich and varied tone possessed by woods and marbles.

There is no requirement that the imitation should be exact to a particular marble, so as to deceive the eye—only that the qualities before mentioned should be reproduced. No one supposes a gold frame is solid gold.

We arrive at "Furniture," only to find the subject so large as to require a separate article—not for the purpose of dividing the indivisible, but from force of circumstances, owing to the space at our disposal being absorbed by remarks on "Decoration."

(*To be concluded.*)

A Chimney Shaft 410ft. High has just been erected by the Belgian Silver Works Company. The interior diameter at the base is about 25ft., and at the top 11ft., and the chimney is surmounted by a lightning-conductor nearly 50ft. high.

BRICKMAKING IN RUSSIA.

Enormous Developments.

In a recent book of statistics published at St. Petersburg it is stated that during last year no fewer than twenty German manufacturers of clay-working machinery carried on a regular trade with Russia, a fact which speaks well for the energy and business methods of machinery makers in Germany, and testifies to the enormous and growing market existing in the Czar's domains for modern and up-to-date manufactured goods. Indeed, in view of the colossal impetus given to the building and the manufacturing industries of the empire by the opening of Siberia, it is safe to assume that the sums of money taken out of the country last year by the twenty manufacturers referred to aggregated several million roubles.

Of all European countries, Russia is, practically speaking, the youngest in the manufacture of building materials. While statistics show that the making of pottery and firebrick extends back to time out of memory, and while pottery in particular constitutes one of the most widespread branches of industry of the empire, the manufacture of brick on a large scale is actually a development of the past ten years.

It may be mentioned in passing that long before the establishment of the present large plants the working of fireclays was carried on extensively as a so-called household industry, i.e. in certain districts every family had a small crudely-equipped plant of its own, with which they produced bricks for sale to the large dealers in building materials. These primitive methods obtained for many decades in the Government of Novgorod and other districts abounding in fireclays, and formed the sole means of production until twenty years ago, when the first large plant was erected in the district of Borovichi.

Previous to this period (namely, 1880) the Russian market for high-grade firebrick was supplied almost exclusively by Great Britain, the English brick sold in Russia being not only of a quality superior to the Russian, but considerably cheaper in price. The lower cost was due to the badly developed transportation facilities between the Russian capital and the clay-producing districts. For example, the freight on a ton of brick from Borovichi to St. Petersburg amounted as a rule to 8s. 6d., whereas the rates from Newcastle to the same point never exceeded an average of 6s. 3d. per ton.

The general excellence of English brick and its lower cost were sufficient to seriously handicap the Russian industry, and not until the year 1891, when the Government was induced to impose a large import duty, did the local production gain a foothold of real strength, that made the present progress of development possible.

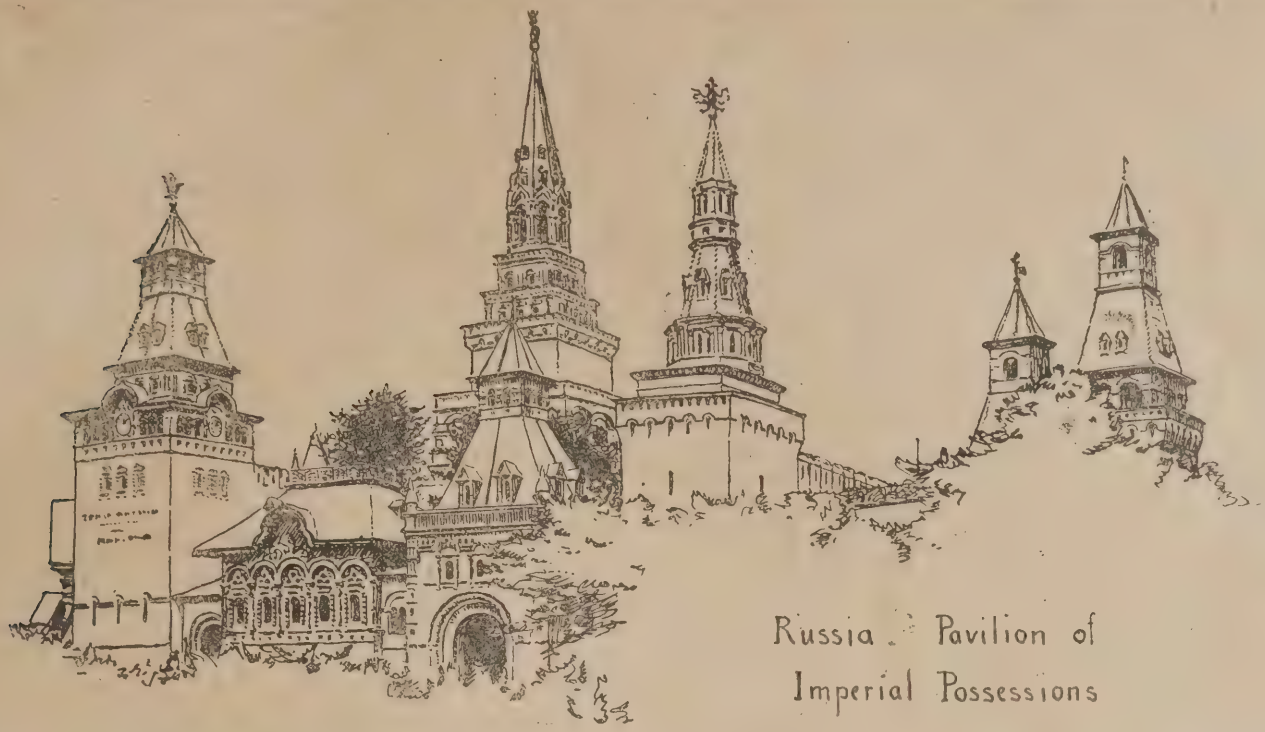
The Vachter Plant.

The large plant in the Borovichi district already mentioned is owned and operated by the firm of K. Z. Vachter. Previously to the imposition of the import duty on firebrick, this plant had attained an annual production of 2,500,000 bricks; these figures increased shortly after 1891 to 5,000,000, until at present the output is not less than 8,000,000. Of course, an output of this size is small in comparison with that of such European concerns as Hoganas, in Sweden; the Glenboigs, in Scotland; or the Baumaterialien Gesellschaft, in Austria; yet, considering that it is practically a mere beginning made by private enterprise under uncertain conditions, it may be regarded as an evidence of the future progress that is destined to be made by the industry in Russia.

The Vachter plant at Zhdani is also a pioneer in the manufacture of drain pipes and stoneware. An important annexe was built to the plant a few years ago, and equipped with three rolling and three cylinder presses for working the clay mass. For fuel, wood dried thoroughly in special kilns is used. There are four such furnaces at the factory. This equipment enables the works to produce daily between 400 and 500 pipes between 6in. and 9in. in diameter: thus the average production amounts to 120,000 pipes per year. Pipes of small diameter, beginning at 2in., are also made, but for these hand presses are used; large pipes are also made of 12in. and 18in. diameter, and, when specially ordered, of 24in.

This brief description of the Vachter plant will serve as an illustration of the general state of the brick industry in the Russian Empire. According to the

Official Statistics



of the St. Petersburg Government the total output of bricks in Russia amounts annually to something over 1,000,000,000: 200,000,000 of the total are produced in the district of Moscow; 100,000,000 in the St. Petersburg district; 80,000,000 in the Government of Kharkov; 70,000,000 in the Governments of Kiev and Ekaterinoslav each; and 50,000,000 in each of the Provinces of Tauride and the Don. In these rough figures the local production of brick by the metallurgical works for their own use is not included; nor are the figures for many of the smaller establishments throughout the empire. Siberia's output of 10,000,000 bricks is also not included.

As fully evidenced by the foregoing figures, the brick industry in Russia and Siberia is fast travelling the way to success, for keeping pace with the growth of the industry is the enormous demand for building materials both in European Russia and Siberia. All cities that are so fortunate as to be in the immediate vicinity of the Trans-Siberian Railway are making great strides in industrial and commercial development. Manufacturing plants of every variety are rapidly springing up along the railway, demanding large quantities of brick and machinery. Indeed, conditions on every hand point to one conclusion—progress.

Masters and Men.

Bricklayers' and Stonemasons' Dispute at Barrow.—In consequence of the men's inability to come to terms as to whose duty it is to lay terra-cotta work at the New Science and Art Schools, the Master Builders' Association have locked out all the men in their employ in these trades, leaving the work open for them when they have settled their difficulty. Replies from 30 large towns show this work is done by bricklayers. The men have agreed to submit the dispute to arbitration.

The Midland Centre of the National Building Trades Employers' Federation held a meeting at Leicester last week under the presidency of Mr. James Wright, Nottingham. The quarterly report presented by the secretary (Mr. A. E. Tallis) referred to the work of organisation going on amongst master builders in the Midland counties towards obtaining a complete federation of employers for the protection of their common interests. The executive called the attention of master builders to the Federation of Trades Unions, and rejoiced that the promoters of this movement declared one of its main objects to be the prevention of strikes. At the same time, the executive warned the members of the Builders' Federation against accepting such a declaration without some reservation. The master builders of the country, probably more than the employers in any other trade, had been the victims of the aggression of trades unionism. They, however, hoped the trades unionist federation would achieve its object in preventing strikes in the future. On the motion of the President, seconded by Mr. F. G. Whittall (Birmingham), it was resolved to request local associations to approach candidates for Parliamentary honours, and also municipal candidates, and ascertain their opinions upon matters affecting the interests of master builders. A discussion took place on the question of builders insisting upon strike, lock-out, weather, and arbitration clauses forming part of any contract, and also that quantities should form part of any contract. Mr. Whittall said that if this matter were looked at properly it would not fail to recommend itself to every fair-minded architect. This view was endorsed by Mr. Chambers (Leicester), Mr. H. Smith (West Bromwich), Mr. Albert S. Smith (Birmingham), Mr. Fox (Leicester), Mr. Weston (Derby) and others.

Russia — Pavilion of Imperial Possessions

THE PARIS EXHIBITION.

BY F. HAMILTON JACKSON.

(*Concluded from p.* 104, No. CCXCII.)

THE other great group is below the Trocadéro, though the pavilions of Morocco, Siam, the Tyrolese house and a few others are scattered round the Eiffel Tower. Crossing the Pont d'Jéna the two pavilions of Algeria flank the ascent towards the cascades. On the right is a pavilion approached by a great flight of steps, the right of which is formed by a minaret which reproduces that of the mosque of Sultan Bacha at Oran. It is white, ornamented with panels of coloured tiles, as is the greater part of the pavilion. The great central cupola reproduces that of the Algerian Fish Market mosque, and the illuminations are the same as those which are seen there in Ramadan. The ground floor has a pretty courtyard which reproduces a portion of the Museum at Algiers, surrounded with slender Mooresque columns supporting a gallery, which one may also enter by the great flight of steps and the elegant portico to which it conducts. Beyond, on this higher level, is another delightful courtyard, with a fountain and plants beneath the great dome. This is a reproduction of part of the mosque of Abd-el-Kadir at Mascara, and one leaves it through a picturesque pointed arched doorway about which lounge men in Arab costume, if not genuine Arabs. On the other side of the avenue are other buildings enclosing dioramas and other curiosities, built in the manner of the houses one sees in Algiers, with projecting windows supported on brackets and colonnades, all glaring white in the brilliant sun, the woodwork painted red or green and equally ornamented with the panels. There is a reproduction of the Kasbah, the narrow street of Algiers, flanked by shops and overhung by musharabiyehs, which appears to be reduced in scale, so easily filled with people is it, but a more successful reproduction is to be found in the Tunisian pavilion close by, where one would almost imagine oneself in the "Souks," the real Tunisian bazaars—rows of little shops of fantastic architecture, half hidden by the goods hung up for sale, and tenanted by real Arabs in brilliant dresses; narrow streets and little squares, some of them vaulted over, the vaults supported by highly-coloured columns and capitals, red and blue or green and blue painted in spiral lines, the caps sometimes Gothic, sometimes Byzantine and sometimes antique. The gateways beneath which one passes are of black and white or red voussoirs; doors are painted red sometimes, with cheap Moorish knockers and patterns in nails of different sizes, or dark wood carved; and among all this the artificers ply their crafts and little Arab children run about or sit in corners. The buildings reproduced are the mosque of Sidi Mahrez at Tunis, that of the Barber of the Prophet at Kairouan, a picturesque house near Bizerta, the pavilion of Manouba near the Bardo at Tunis, an ancient gateway from Monastri, and the lofty minaret of Sfax. The pavilion of Indo-China is nearly as interesting. Here are reproduced the Pagoda of Cho-Lon, the Tonquinese palace of Co-Loa, an Annamite house brought piece by piece from Thudaumot on the Saigon river and re-erected here, and the celebrated Royal Pagoda of Pnom Penh, which is one of the sights of the capital of Cambodia. One enters a subterranean hall, which looks like a rock temple, with strange pillars and capitals of bizarre ornamentation, where are shown views of various parts of Indo-China: from this hall an ingenious double spiral stair leads to the summit of the rock upon which the Royal Pagoda is set on a terrace surrounded by queer dragon-like monsters with erect tails. The stairs on the side of the hill are very steep, and guarded here and there by more monsters, and the pagoda is occupied by a special exhibition of Buddhist religious art. In a corresponding situation on the other side of the cascade is the pavilion of the Russian Imperial Possessions, a building covering a large space and which is one of the most important and solid-looking. It has six or seven large towers with pyramidal roofs covered with coloured tiles and enlivened with gilding, and the whitish walls relieve them with great effect. The architecture is intended to reproduce a princely dwelling of the ancient Muscovites, and is supposed to be based upon that of the antique Byzantine school. Several portions of the interior are very effective—in particular a court with a fountain in the centre and paintings of ruins with landscape and figures with architecture, painted sketchily but with breadth of effect, and surrrounded by a painted framing in imitation of Persian tiles, so well done as to be almost deceptive. This court has stairs leading from it to a higher level at the angles and is itself approached from a lower level by a few steps. Here it is that the costumes of the Asiatic peoples are seen, adding picturesqueness to the scene, and ready to sell the carpets, skins, rugs, and other objects which are exposed. Behind the pavilion is a Russian village, massive wooden loghouses with rustic furniture and other objects manufactured in country places—not the least interesting part of the exhibit; and on the first floor is a panorama of the Trans-Siberian Railway. Close to the Russian pavilion, as is fitting, is the Chinese Garden, with its pavilions, one of which (used as a restaurant) is a reproduction of one of the gates of Pekin, while another is a copy of one of the six pavilions which together make up the Imperial Palace of Pekin. There is also a reproduction of a celebrated gate of marble and yellow and green pottery from the Temple of Confucius, of which there are two copies in China, and in the shops Chinese artificers may be seen at work. The ground occupied by Japan lies a little distance away, and, like the Chinese buildings, its pavilions are dotted about a delightful garden, which, when I saw it, was rich with lilies and Japanese iris. The principal building is a reproduction of the Temple of Hondo, the golden temple, built at Nara, the Japanese capital in the seventh century. It is painted gold colour relieved with red, and the doors are of gilded bronze, of which material the roof also appears to be, though it is really constructed of glazed tiles. It contains a magnificent collection of antiques, most of which come from the collection of the Mikado and the great Japanese lords, and have never before been seen in Europe. There are lacquered boxes dating from the ninth and eleventh centuries, other boxes inlaid with mother-of-pearl on gold lac from twelfth to seventeenth centuries, wooden dancing masks of the eighth and twelfth centuries painted with vivid colours, and other wood sculptures of the ninth and thirteenth. Metal vases from the twelfth century onwards, a metal pagoda of the eighth and a bronze statue of "Kaimon" of the same date, a seventh century coffer inlaid with mother-of-pearl peacocks in circles, pictures from temples from the ninth century to the fifteenth, fine in colour and very decorative, and a long roll of eleventh century drawings of animal stories, better than European MS. of the same period, showing the tricks played by the frog on the other animals in a sort of "Brer Rabbit" fashion—to enumerate only a few of the treasures. There is also a curious standard of plates of gilded bronze dating from the seventh century. Other pavilions shelter a tea-house (where "The Washington Post" was being played by a band!), a pavilion of Sake (where stronger liquors might be had), and a row of shops. Above it is the Egyptian temple, partly a reproduction of the Temple of Daudourt in Nubia, partly of Philæ, Abydos and Karnak. It has an internal court beneath which is a crypt reproducing some of the tombs, and there is also an Arab bazaar and a theatre. To the west are the pavilions of the Dutch East Indies, in the centre of which is a temple made up of casts from the friezes of the celebrated Buddhist temple of Boeroe-boedoer, a cast from the great portico of which is within, together with other examples of Hindoo sculpture. Panels with fantastic framings and crestings contain attitudinising figures of gods and god-

desses, while round the wall of the terrace runs a series of bas-reliefs of the legends of the Hindoo pantheon, and strange monsters rise here and there as terminals. The pavilions on each side represent the houses of Sumatran natives, carved all over with ornament, painted in brilliant colours and crowned with thatched roofs rising to acute peaks over the gables in strange but not unpleasing curves. Lower down, by the side of Japan, are the pavilions of the English Indies and other colonies—Ceylon, Canada and Australia. The first is the more remarkable, with a great gateway approached by steps between two circular towers, with open loggias and roofs of the kind with which Earl's Court has made us familiar. The staircase within is decorated with carvings by Burmese artificers, and the external surface of the white walls is relieved by an ornamented parapet and by rows of windows grouped beneath projecting roofs.

The pavilions are most of them interesting on account of the reproductions of ancient work which form so great a part of their structure. In Vieux Paris numerous buildings of different ages and of historic interest have been reproduced from old authorities and grouped together on different levels in a most picturesque and convincing manner. The woodwork has been painted and then weathered, the plaster imitates the effect of age and weather upon stone in the most marvellous way, and it is difficult to imagine how this portion of the Exhibition can be improved upon, as far as its somewhat theatrical construction goes, though the management may leave much to be desired. Here are several of the gates, the towers of the Louvre and the Archbishop's Palace, the great hall of the Royal Palace, the Chatelet, the Pont au Change and many historic houses, either entire or in part, while along the Seine runs a varied façade with projecting bays and windows of innumerable shapes; on the other side, under the trees of the Quai Debilly, is a row of attractive and picturesque shops. The architects and painters who have carried this out are much to be congratulated, and in my opinion this is the real "clou" (to use the French slang) of the Exhibition.

Views and Reviews.

THE WHOLE HISTORY OF ACETYLENE.

It would be idle to attempt any detailed criticism of this great work of more than 900 pages. Acetylene as a commercial possibility is so young that many persons will be surprised that so large a volume could be filled with the story of its birth and youth. Much space has been occupied by the illustrated description of the various forms of apparatus upon the market for use in connection with the gas; but this is a feature that could not well have been sacrificed. The book, if somewhat bulky, is exceptionally well produced; the clear type and sideheads in red make the work of reference or verification simple and pleasurable. A summary of the legal enactments regarding acetylene, also a précis and catalogue of the patents granted, will be of much value, and the book closes with an excellent index. The work of collecting, tabulating, and verifying the facts contained in the volume must have been enormous, and suggests that the author has made the subject his life study. At the published price the work is marvellously cheap, and it is *the* text-book on the subject written by an authority.

"Acetylene: A Handbook for the Student and Manufacturer," by Vivian B. Lewes, F.I.C. Archibald Constable and Company, Westminster. Price, 31s. 6d. nett.

A Move at Last.—The Limehouse District Board of Works have decided to request the London County Council to modify the plans put before them for approval by the London and Joint Stock Bank for the erection of premises in Commercial Road, which, if carried into effect, will entirely spoil the eastward view of the tower and clock of Limehouse Parish Church.

SANITARY CONGRESS AT STIRLING.

THE twenty-sixth annual congress of the Sanitary Association of Scotland opened in Stirling on September 6th. The members met in the Lesser Public Hall, under the presidency of Provost Forrest, Stirling, who was accompanied on the platform by Dr. Campbell Munro, president of the Association; Bailie Ferguson, convener of the Public Health Committee of Stirling Local Authority; and Dean of Guild S. F. Millar.

After the Chairman, on behalf of the municipality, had given the Congress a hearty welcome to the town, Dr. A. Campbell Munro delivered his presidential address on "1800-1900: a Retrospect." At the beginning of the nineteenth century, he said, the principles of water supply and sewerage were less understood in England than they had been in ancient Rome. In Liverpool in 1800, out of a total population of 56,000, 7,000 dwelt in underground cellars, while the death-rate of Glasgow, they were told, was higher than that of London at the worst period of its history. As had been epigrammatically remarked, nature did not exhibit her uniformity by any pedantic adherence to the decimal system, and so far as the birth of a new century was concerned in regard to public health things became worse rather than better in its earlier years, because of the influx of the rural population into the courts and alleys of the large towns. Indeed, as late as the period 1831-39, the death-rate of Glasgow, which had been 26·4 over the years 1822-30, rose to 31·3 per thousand. The present-day condition of things in the good town of Stirling stood out in strong relief against the picture presented by a witness who appeared before a Commission appointed to enquire into the sanitary condition of the principal towns. "The filth of the jail," it was stated, "containing on an average 65 persons, was floated down the public streets every second or third day, emitting during the whole of its progress down Broad Street, Bow, Baker, and King Streets, the most offensive and disgusting odours." They had travelled far since those days, and the advance in sanitation had had a marked effect upon the health of the people.

In the course of a paper on "Public Health (General View, Special State Department)," Dr. A. F. Wilson, Medical Officer of Health, Stirling, said that the chief objects of the Association were the stimulation of general interest in public health and attention to sanitary legislation. To secure the best results they would require the appointment of a Minister to control public health, who should have a seat in the chief council of the nation, and he thought a movement should be inaugurated in Scotland for the establishment of a special State Department.

Mr. George A. D. Mackay, Inspector of Cleansing, Edinburgh, read the next paper, on "Tact as a Factor in Sanitary Administration."

With regard to the personal qualities that made for success in sanitary administration, there was none, he said, so valuable as tact or manner. Tact had its basis in common sense, and it carried in its train a refined sense of the fitness of things, a nice consideration for the rights and interests of others, a delicate and thoughtful appreciation of circumstances, a unique felicity of speech and bearing, and a spirit that conciliated opposition and made for peace. It was very largely due to the influence of tact that the cause of sanitation stood so well with the public as it did to-day, and in this connection Glasgow had a memorable and inspiring record. At a time when the work of sanitation throughout the country suffered from lack of concentration and from fitful performance, Glasgow in a happy moment wedded foresight to enterprise, and led the way in a new and much required direction. In certain departments of human activity the main thing was to perform the duties of the moment as they arose; the sanitarian who had risen to an adequate conception of his calling would find that he owed a great deal more to himself and the public whom he served. He had not only to insist on conditions that made for health, but to do so in such a manner that those whom he sought to benefit might be imbued with his spirit, and become induced to do for themselves what in the imperfect state of individual education was imposed by collective authority. In other words, he had not merely to be an inspector, but a sanitary missionary, ever recognising that his highest attainment lay in the conversion of the public, without whose co-operation his best efforts would be largely in vain.

Dr. Patrick Murison, Medical Officer of Public Health, Sutherlandshire, read a paper on "The Housing of the Working Classes." He pointed out that it was only within the past fifty years that the Legislature had interfered for improvement in the dwellings of the labouring classes, and year after year had seen an increase of zeal and action. Housing the working classes in the suburbs might solve the difficulty; decentralisation might be the panacea, combined with organised means of transit. Every city could point to moral improvement following improvement in buildings. Tenements had been declared over and over again to be the curse of modern civilisation. Block buildings must not be universally condemned, however, because when substantially built, they were comfortable, and, faithfully superintended, they had been shown to be healthier than were the general buildings of the community in which they were placed. The Peabody buildings in London were a proof of this. He suggested that surveys of all tenement buildings should take place every five years by the burgh surveyor, medical officer, and sanitary inspector.

Mr. J. P. Lawrie, sanitary inspector, Bo'ness, followed with a paper on "The Framing of an Improvement Scheme," and Mr. Robert Lindsay, sanitary inspector of Midlothian, read the last paper, dealing with "The Re-housing Problem."

The company afterwards visited the East and West Churches and the Castle of Stirling, and in the evening the annual dinner of the Association was held in the Public Hall, Dr. Munro presiding.

Surveying and Sanitary Notes.

For the Demolition of Insanitary Property in Liverpool the Liverpool City Council have decided to seek powers to borrow £200,000.

Mr. F. C. Uren, C.E., of the City Engineer's Offices, Oxford, has been appointed engineer and surveyor to the Town Council of Trimley, Surrey.

Sewerage Works at Mellor are proposed by the Hayfield Rural District Council, and the tender of Messrs. Reed and Sons, Burnley, for the carrying out of the works has been accepted conditionally at £2,013.

A Proper System of Drainage for St. Budeaux, Devonport, is to be constructed by the Devonport Town Council. The tender of Mr. Samuel Roberts has been accepted at £8,129, and Mr. W. G. Smith appointed clerk of works.

New Members of the Institute of Sanitary Engineers.—At a meeting of the Election Committee held on the 12th inst. the following gentlemen were elected:—*Members.*—A. Hale, Simla, India; F. D. Stuart, Lincoln; and A. Styles, New Cross. *Associate.*—F. E. Wintle, Berealstone.

Sanitary Measures to Stop the Plague a Glasgow.—The Glasgow correspondent of the "Public Health Engineer" states that the measures adopted by the Glasgow health authorities to disinfect suspected districts were: All walls, ashpits, closes, and passages in the infected district were limewashed, with an addition of chloride of lime in the proportion of 1 in 100. Streets and courts were washed with a hypochlorite of soda solution (Chloros) in the proportion of 1 in 30. The walls, floors and ceilings of rooms were disinfected, first, with sulphur, and afterwards with a preparation known as Formalin.

Bricks and Mortar.

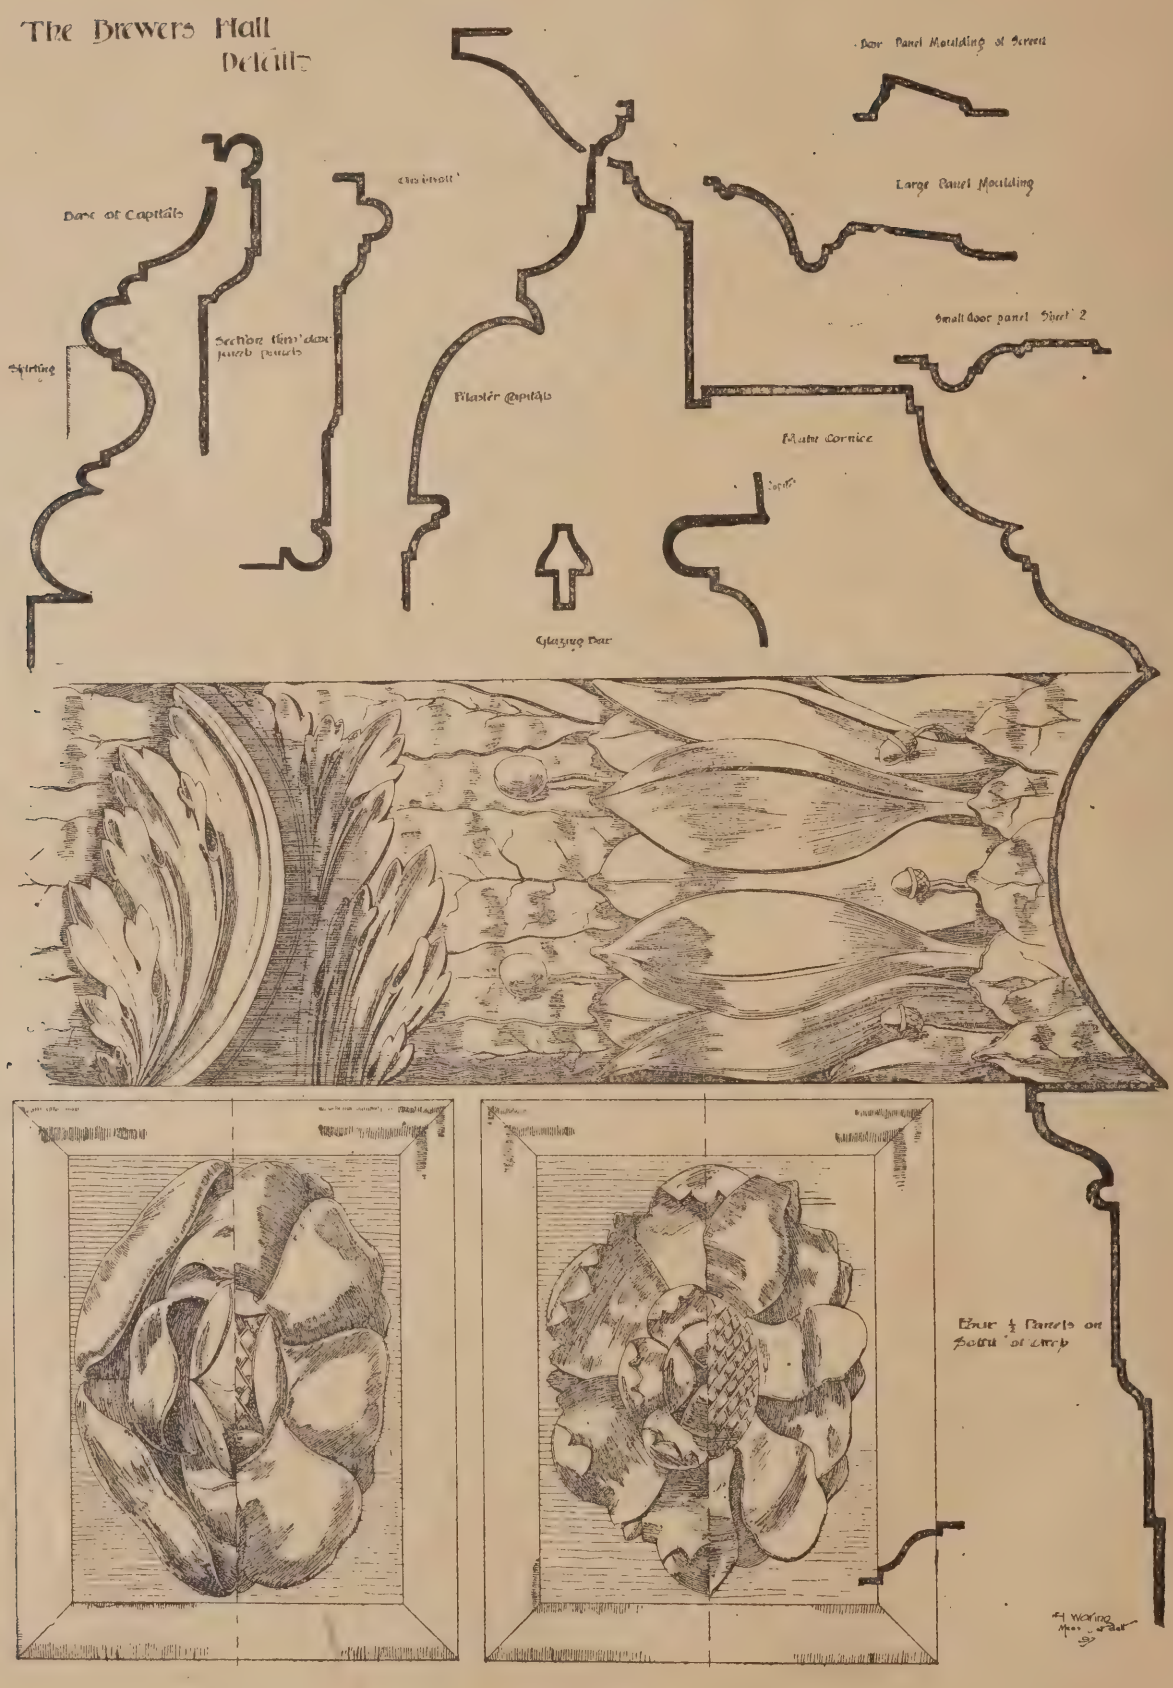
APHORISM FOR THE WEEK.

"If thou seekest to please, behold thou art straightway fallen."—EPICTETUS.

Church House, Liverpool. THE new Bishop of Liverpool has undertaken to further the completion of that Victoria Church House at the corner of Lord Street and South John Street which will serve as a memorial of the first bishop of the diocese and as a thank-offering in connection with the Queen's Jubilee. The total cost of the scheme, including the acquisition of the site, will be between £80,000 and £85,000, of which £48,000 goes for the site. The amount subscribed up to the present approximates £23,000; of this £10,000 has been paid towards the purchase of the site, leaving £38,000 on a mortgage, which will be paid off in the course of years by rents from tenants of shops on the ground floor. With the £13,000 thus free for building purposes, the first section of the Church House is being erected, and hopes are entertained that before the close of the year it will be so far completed as to provide the accommodation required by the Diocesan Finance Association, the Bishop's Registry, and the Ryle Library. The Bishop of Liverpool now asks for £20,000 more to be raised, so that the scheme may be completed for housing all the diocesan institutions in one building. The plans include a hall to seat about 400 persons.

Cave Dwellings. PROFESSOR J. R. S. STERRETT describes in the "Century" a region of Cappadocia in which, as he believes, the inhabitants have been cave-dwellers for nearly four thousand years. Many of them live in cones of stone that have been left by the washing away of the surrounding earth: the height of the cones varies greatly, ranging perhaps from 50ft. to 300ft. Upon entering the doorway one finds within a spacious chamber, about whose walls niches and shelves for the storage of small household effects have been cut into the stone. The stairways leading to the upper storeys are like wells or round chimneys, and one ascended to an upper storey by means of ladder-holes, precisely like those which gave access to the front entrance. The floors between the storeys were usually thick enough to withstand any weight that might be put upon them, but occasionally the excavators miscalculated the thickness of the floor, with the result of making one lofty chamber instead of two. The Professor counted as many as nine storeys in one cone, but most have only two, three, or four storeys. A due proportion of the cones were reserved for the worship of some god, whether pagan or Christian. The period to which these belong is revealed by the imitated architecture. A cone with a portico and Doric columns belongs clearly to the period when Greek civilisation was dominant. An interior with pseudo-arches belongs to the Greco-Roman period. An interior which imitates the characteristic Byzantine church is clearly of Christian origin, though its date may be a matter of dispute. The interior walls of the Byzantine churches are still covered with frescoes, which, of course, are more or less obliterated. Among them are found not merely portraits of Greek saints, each with the characteristic nimbus, but even pretentious paintings embracing a large number of figures. Some of these paintings are ancient in style, others more modern.

The Passing of Christ's Hospital. THE outer bricks and other covering of the picturesque old façade of the southern entrance to Christ's Hospital, in Christ Church Passage, are now being removed; they will be packed and forwarded for re-erection in the new school at Horsham. The same process will be gone through with other characteristic portions of the architecture. The statues of Charles the Second, Sir John Moore, and the Blue Coat Boy have already gone down to Sussex, and the canopied effigy of the founder, Edward the Sixth, has been taken down ready for transit. The cloisters are the most ancient and interesting part of the doomed building. They occupy the site of the old churchyard of the Grey Friars' Monastery. Nothing further is known of the negotiations between the governors of St. Bartholomew's Hospital and the governors of Christ's Hospital with regard to the disposal of the site, except that no decision has been arrived at. So far back as 1872 the Governors were offered £600,000 for the schools and ground for a new street and a railway under it, but upon that occasion the associations connected with the place proved too powerful, and the proposal was rejected.



On the Fringe of Manchester. AT Trafford Park, just outside Manchester, a new town is being built. It is the outward sign of a large speculation, and verily there is no sentiment about it. The Park has a total area of 1,183 acres, and extends lengthwise along the south bank of the Ship Canal from Old Trafford to Barton. About 280 acres, or about a quarter of the Park, have been either sold or leased by the Trafford Park Company, and are in process of conversion into sites for factories and warehouses. The building activity on this land is simply astonishing to one who has not visited the Park for twelve months. Apart from a large number of works either erected or in course of erection, there are dotted about contractors' yards, timber yards, and brickmaking yards, all busy with work in part dependent on the developments in the Park. Last, but not least, there are in process of erection many hundreds of dwelling-houses, designed to accommodate the workpeople who will earn their living in the Park. Altogether it is proposed to build about 1,500 houses, or about thirty houses to the acre. Between four and five hundred of the houses are either finished or nearing completion. The land is parcelled out in parallelograms in true American style, with "avenues" running in one direction and streets in another, all designated by a number—first street, first avenue, and so forth.

Money versus Life. THERE is no waste of land. The houses are crowded together just about as closely as possible. There are no gardens or trees, and grass will be unknown when the whole area is covered. It is a model village, chiefly in the sense, however, of demonstrating what a number of houses may be placed upon a small plot of land without offending the essential, simplest rules of hygiene. It may be good to erect a town of dwelling-houses, but surely this is not sufficient. Probably the Dwellings Company will consider they have done their full duty if they make a good paying return out of the land—and the greater the return the better will they have done their duty. What have they to do with schools, churches, halls, recreation grounds, or any other non-productive (in the money sense) sentimentalities? But a writer says:—"Yet the time will come when all these and other necessities to modern sociology will have to be considered; and it is to be hoped it will not be delayed until the little colony of 7,000 or 8,000 people with its 50 acres of breathing space is totally surrounded by factories. What a pity there is not a Lever Brothers or a Cadbury Brothers in Trafford Park. Will the Dwellings Company in their absence combine a little philanthropy with their speculation?"

Rothesay Castle. THE Marquis of Bute has started to build a modern addition in red sandstone to the ruins of Rothesay Castle. The oldest portion of the structure is supposed to have been built in 1098 by Magnus Barefoot, King of Norway, and the more modern part dates from the time of King Robert the Second, who used it as a royal palace. The castle has stood many sieges, and was even captured by an English force, who, however, in 1311 surrendered it to Bruce. The renovation which the Marquis of Bute has commenced is in the northern portion, close to the drawbridge, and the modern stone is said to make a most painful contrast to the old structure. The Marquis's action is the more incomprehensible inasmuch as he did a real public service some years ago in clearing away several tenements which almost hemmed in the castle from view, and in re-excavating and filling up the moat, across which he caused a drawbridge to be thrown.

Glasgow Exhibition, 1901. THE commanding building of the exhibition to be held in the Kelvingrove Park, Glasgow, next year, will be the new art gallery and museum, the future home of the art and science collections of the Corporation. This may be regarded as a direct outcome of the 1888 exhibition, and it is in connection with its inauguration that the exhibition has been organised. With the 1888 surplus as a nucleus, the subscriptions of private citizens have provided towards the cost a total of about £130,000, and the profit of the coming exhibition will be handed over to the Corporation to be applied towards reducing of the balance—the galleries are to cost about £200,000—and for the promotion of art and science generally. Holding that the beginning of the twentieth century affords an appropriate occasion for reviewing the art of the preceding hundred years the Executive Council of the Association have decided to form a loan collection of pictures and sculpture, and the appeal which has been made to art collectors has met with such a cordial and ready response that the display of objects of artistic and historical value promises to be unique. Her Majesty the Queen has intimated her intention of making appropriate loans from the royal collections, and the Prince of Wales readily consented to enrich the section by sending several artistic treasures for exhibition.

Housing Liverpool's Poor. AT the present time the Corporation of Liverpool is carrying out an extensive scheme for housing some of the poor by erecting 182 houses in Dryden Street and Rachel Street, off Scotland Road: 160 of them will be two-roomed houses—namely, a kitchen (or living room) and a bedroom. There are besides a scullery, a corner for coal, a closet, and a space for drying clothes. There will be sixteen houses of three rooms, and six houses of four rooms. It is expected that the cheaper class will be let at 2s. 6d., which would be about 1s. 2d. or 1s. 3d. per room per week, with the other accommodation thrown in. The intermediate class will be let at 3s. 6d. or 4s., and the best at 5s. 6d. These rents, however, will not recoup the Corporation for its outlay. A recreation room for the use of tenants will also form a portion of the buildings, and there will be added an open space where the children may romp and play. The new houses are substantially built, each storey having a concrete floor. Every set of rooms will have a separate supply of hot and cold water, with all modern sanitary arrangements. The installation of a hot-water supply and the provision of a common recreation room is an experiment which Liverpool is the first to try, and one to which the Local Government Board has given ready sanction. The buildings are three storeys high. Access to the ground-floor rooms is to be had from the front, and a staircase at the end of each block of houses leading to a balcony gives access at the rear to the upper storeys. In the better class of houses the rooms are 15ft. by 10ft. 6in., in others 13ft. by 9ft. 3in., and the smallest rooms are 9ft. 3in. by 9ft., with head space of 8ft. A gas service will be installed in each tenement, so that tenants can supply themselves with gas on the penny-in-the-slot principle. The plans were supplied by Mr. Turton, deputy surveyor to the Corporation, and the work of erecting the buildings has been entrusted to Messrs. Holme and Green, contractors. The houses are built of grey bricks picked out with bands of red pressed bricks. The treatment from an architectural point of view is severely simple, the object being to provide cheap dwellings for the very poor, and not to attract tenants who could afford a higher rent.

MEASURED AND DRAWN BY H. F. WARING.

THE CHINAMAN AS CLAY-WORKER AND BUILDER.

HIS MATERIALS AND METHODS.

AS a worker in clay John Chinaman began business about four thousand years ago, and he also, at this early date, used the potter's wheel. Chinese tradition says the making of porcelain began about 2697 B.C., but it is thought that the ware produced then was only a common glazed kind, and that the time of the beginning of porcelain was somewhere between 202 B.C. and A.D. 220. But whether he began "early or late," the Celestial soon showed his ability to make things of beauty—first producing exquisite effects in blue tints, and then through various colours to the famous pink tint, finding nearest perfection in the peach-blow hue. And thus the Mongolian potter went on with his work, making improvements and keeping his secrets, and it was not until the early part of the eighteenth century that the Chinaman's method of making porcelain became known to outside nations.

A traveller in the Celestial Empire, in the latter part of that century, in speaking of the manufacture of this fine ware, says that a village, or unwalled town, called King-te-tching, contained three thousand furnaces for baking porcelain, and that when these furnaces were all lighted the place had the appearance of a town on fire. Père de Entrecolles, writing from China at an earlier date, also speaks of this town, and gives an idea of methods, material used, &c. Among other things, he tells us that Chinese porcelain (Tseki) is composed of two kinds of earth—namely, pe-tun-tse, a quartzose felspathic rock, and kaolin, a hydrous silicate of alumina. He says: "These two materials, after having been made into bricks, are brought down the river in flat-bottomed boats. The pe-tun-tse is transported some eighty miles, and the best quality is of greenish hue."

In regard to

Brickmaking in the Flowery Kingdom,

not a great deal is known. Of course the hand-work process is in use, as labour is exceedingly cheap, and, where there are about 400,000,000 people, more than abundant. If machines were introduced, it is more than probable that many, if not all, of them would be destroyed.

For many centuries the Chinese have been makers of bricks, and that they understand this art is fully demonstrated in a great many of their ancient architectural specimens. And this is nowhere better shown than in their Great Wall, which takes its winding way over mountain, valley, plain, hill and river for a distance of nearly fifteen hundred miles. In this stupendous structure there are billions and billions of bricks—all made from the soil of China, coming, it is safe to conclude, from thousands of kilns, constructed in advance of and along the route of the wall. The blue colour of these bricks once led to the belief that they were simply sun-dried, but experiment demonstrated the fact that they were kiln-burnt, and besides this, remains of ancient kilns were found near the wall. Contrary to popular belief,

The Great Wall

is not a solid body of brick or stone, but is composed of parallel retaining walls of brick resting on a stone foundation and filled in with earth and other material. As to the width of the wall, there seems to be a difference of opinion: some writers say 40ft., others much less than that. But there is similarity of opinion in regard to its height—25ft. Sir George Staunton, in his "Embassy to China," published in London in 1793, describes a portion of the Great Wall situated near Koo-he-koo, and gives thickness at cordon as 15ft 6in.; at bottom of brickwork, 21ft., and at stone base, 25ft. The distance of the towers from each other is considered to be about 100yds. In describing one of these the old writer and traveller says: "It consisted of two storeys besides its platform. The lower storey was on a level with the terrepleine of the wall. It was a square and almost solid mass of stone, intersected with arched passages in the form of a cross, at each extremity of which was a window or large port in the centre of each side of the square. Midway between the entrance and the centre of the cross is a narrow staircase, which communicates with the second storey. . . . In the parapet of the platform are twelve embrasures, three in each front, with loopholes in each interval. Total height of the tower is 48ft.; length of each side of square at bottom, 42ft.; at top, 36ft. . . . The quoins of the doors, windows, ports, embrasures and many of the salient angles and staircases in the towers, as well as the stone foundations, are of strong grey granite, with a little mixture of mica in it. The rest of those buildings consist of bricks of a blueish colour. They are laid in laminæ of a brick thick each, forming, as it were, so many distinct walls as there are bricks in thickness. They differ in their dimensions according to the situations in which they are placed. Those in front of the walls and towers are as follows:—Thickness of the bricks, 3¾in.; width, 7½in.; length, 15in. Those for the terraces of the wall and towers differ only from the former in being perfectly square, each side containing 15in. Wherever, for finishing the tapering tops of the parapets, bricks of the usual dimensions would not answer, instead of chipping off to the required size, they were moulded to suit the shape wanted. The cement or mortar between the different layers of brick was upwards of ½in. in thickness, and was of calcined limestone."

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

New Books on Valuations.

LONDON, W.—E. W. K. writes: "What new books are there on the valuation of house property, &c., and where can they be obtained?"

"Handbook of House Property," by E. L. Tarbuck (4th edition), price 4s. 2d., post free; "Valuations and Compensations," by Professor Banister Fletcher (a new edition of "Compensations," to which are added chapters on valuations), price 5s. 6d.; "Hints to Young Valuers," by A. R. Cragg, price 20s. These books can be obtained from B. T. Batsford, 94 High Holborn, W.C.

Books on Electric Lighting for Architects.

MANCHESTER.—F. B. B. writes: "Please name an up-to-date book on electric lighting and fittings suitable as a reference book for an architect."

"Electrical Installations," by F. J. Warden Stevens, price 2s. 6d.; "The Internal Wiring of Buildings for Electric Lighting," by H. M. Leaf, price 3s.; "Electric Light Fitting," by W. Urquhart (third edition), price 4s.; "Practical Electric Light Fitting," by F. C. Allsop, price 4s. Mr. B. T. Batsford, of 94 High Holborn, W.C., can supply these books. Postage will be extra.

Renaissance Buildings around Bradford.

BRADFORD.—STUDENT writes: "Could you give me the names of a few buildings in the Renaissance style in the neighbourhood of Bradford which are worth measuring?"

St. John's Church, Leeds (1631-1633) is the largest and best church which was built entirely from the foundations in the seventeenth century. "Student" will find he can spend a considerable time in measuring work in this church. Leeds is nine miles from Bradford. *Oakwell Hall*, near Birstall (six miles away) is the original of "Field Head" in Charlotte Brontë's "Shirley." It is now unoccupied, and contains a panelled inner hall with a gallery and various interesting apartments. I do not know its exact date. *Swinsty Hall* (1527) is about six miles north of Otley (that is, about fifteen miles from Bradford). There is a fine mantel in the dining hall, and above this room there is what is known as the "Oak Room," which is well preserved. *Farnley Hall* is close to Otley, and partly in this style. It has a fine Turner collection and other interesting relics (some of the Civil War). *Arthington Hall* is about ten miles away and is of average interest. A wing was added in 1877 from designs by Alfred Waterhouse, R.A. *Fountains Hall*, near the Abbey, is a splendid mansion. It perhaps can hardly be called in the neighbourhood of Bradford, but a visit would ample repay anyone for the distance.

W. J. MORLEY, F.R.I.B.A.

Engineering Notes.

For Supplying Enfield with Water a new waterworks is proposed to be constructed at a cost of £41,000.

Tondu Board Schools are being fitted with the "Small Tube" hot-water heating apparatus by Messrs. John King, Limited, engineers, of Liverpool, who are employing their latest improved economical coil heater.

The Royton Scattered Homes for the guardians of the Oldham Union are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Midland Railway Extension.—The contractors (Messrs. Walter Scott and Co., of London and Newcastle-on-Tyne) who have had the task of widening the Midland Railway between Swinton and Cudworth have now completed that section of the line known as the Darfield and Wath widening.

The Doom of Cannon Street Station.—It is stated, though with what authority seems a little doubtful, that Cannon Street Station is doomed. According to a railway official, it is a "bogus terminus," and the cause of all the delays on the line. But, in view of the recent baseless rumour regarding Ludgate Hill Station, it is not safe to believe the rumour yet.

An Engineering Institution and its Title.—At the recent annual meeting of the Chesterfield and Midland Counties Institution of Engineers much discussion took place over the recommendation of the Council to change their title to "The Midland Counties Institution of Engineers." A poll of the whole of the members (who total 334) was demanded, and this the president (Mr. Maurice Deacon) undertook to arrange. The institution has now £713 18s. 2d. in hand.

Lighting the Embankment.—The scheme for electrically lighting the Victoria Embankment will be commenced probably about the beginning of November. Tenders have already been accepted for laying the mains, and the whole of the lamp standards have been purchased. The scheme is expected to be completed by early summer next year. The total number of the lamps will be 144: they will be divided into nine electrical circuits. The lamp standards will be 24ft. high, and the lamps will be suspended over the roadway from an extending arm.

Messrs. John Spencer, Limited, of the Globe Tube and Engineering Works, Wednesbury, have just issued the twentieth edition of their catalogue of iron and steel tubes and fittings. This well-known firm give in their catalogue prices, illustrations and particulars of tubes for gas, water, steam and hydraulic purposes; boiler tubes; compressed-air tubes; water mains; well tubes; telegraph, electric-light and telephone poles and tubes; overhead electric tramway poles and their bracket arms, bases and fittings; high-pressure steam mains; sewer ventilating columns; coils for heating purposes; boiler mountings; valves; and an innumerable number of small fittings. As this list cancels all previous issues a copy should be obtained.

SOME NOTES ON DRY ROT.—III.

By A SPECIALIST.

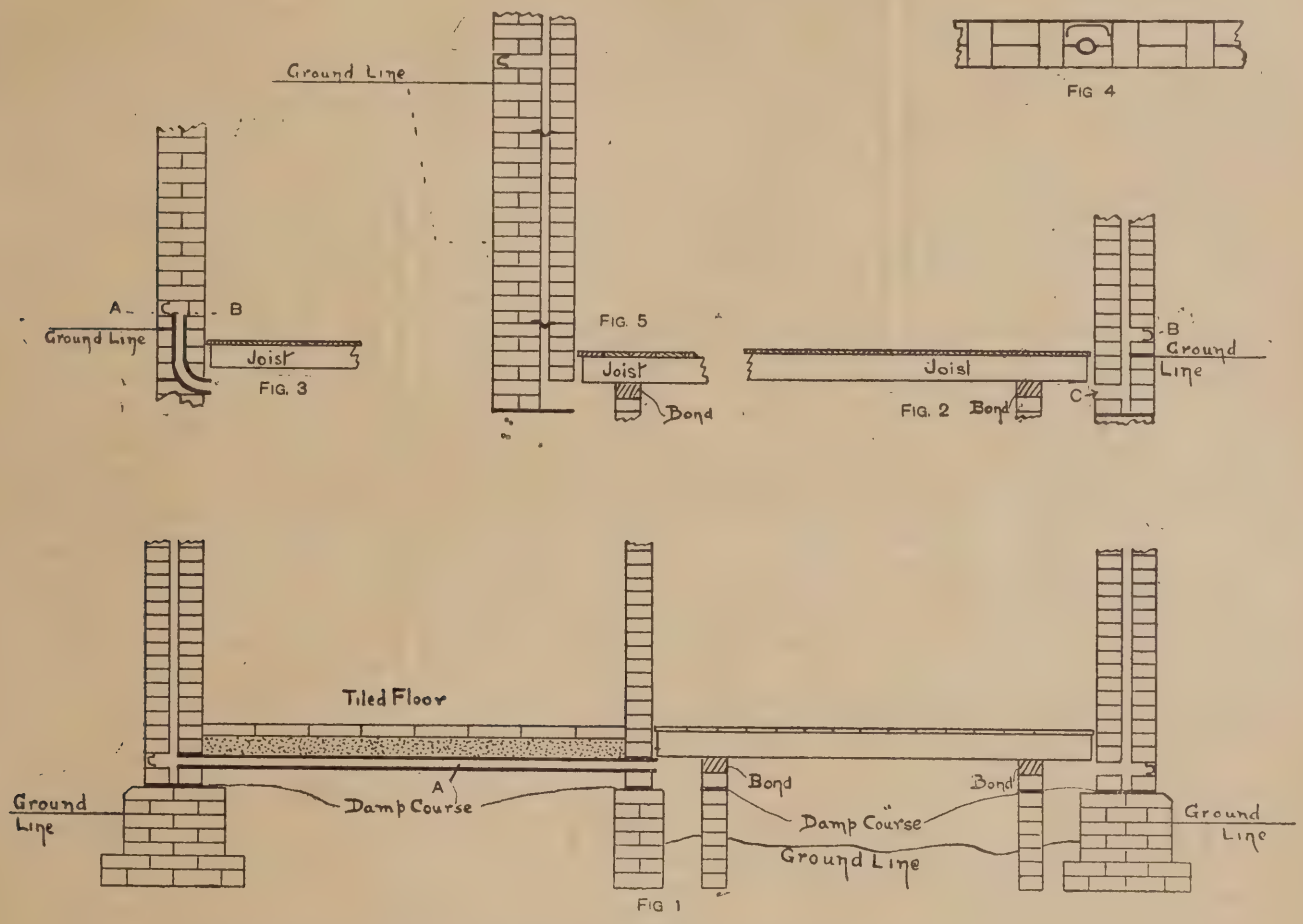
(*Concluded from p.* 88, No. CCXCI.).

THE illustrations accompanying this article are given as examples in which ventilation can be obtained only by resorting to some unusual means; in each of the cases shown it was stated that ventilation was not possible.

Fig. 1 shows the section of two ordinary rooms; the one has a boarded floor, the joists being supported on sleeper walls in the usual way, and the other has a tiled floor, the tiles resting on ballast or mortar. Now in cases like this one, the usual provision for ventilation is to insert two or three air-bricks in the front wall and the end wall (if it is an outside wall); failing this, the front air-bricks have to suffice, and, as may readily be seen, a circulation of air is impossible, so that with the slightest chance dry rot will ensue, and will obtain a firm hold before it is discovered.

By inserting air-bricks in the back wall opposite the front ones and laying ordinary drain pipes from them to the opening below the boarded floor (as shown at A, Fig. 1) ventilation is assured throughout all the space under the floor. The extra cost is very little, certainly much less than the first batch of repairs would be. Some persons object to the drain pipes because they form runs for vermin. This they may do to a certain extent, but if the runs are not there the vermin will make some for themselves, so that the argument is a feeble one; besides, in any case vermin are preferable to dry rot, as it is less expensive to get rid of them. In cases where a boarded floor comes between and parallel with two tiled floors, it is a very good plan to place drain pipes under both of the latter leading from the space under the wood floor to air-bricks in the outside walls, even if there are already others running at right angles to them, as the more fresh air under the floor the better for the wood, and the drier will be the house. Many misguided persons cover up all the openings of air-bricks to prevent a draught being felt in the rooms, forgetting that this draught is the sign of good ventilation, and consequently a lasting floor. If the draught finds its way up into the room, it shows that the workmanship of the floor is at fault, and this is where the remedy should be applied.

In Fig. 2 is shown the proper method of ventilation when the floor is unavoidably below, or level with, the ground line. The air-brick, B, is inserted well above the ground, so that the surface-water cannot enter. Air is thus admitted into the cavity of the wall, and an opening is made opposite each air-brick, but below the joists (as at C), admitting the air into the space below the floor. The tubes can be used in such a case as this equally as well as in Fig. 1.



Should the walls be solid, so that no cavity is available as a connection between B and C, the device shown in Fig. 3 is very effective. It is simply an ordinary drain pipe and bend built into the wall to form the air passage (a section on line, A—B, is given in Fig. 4). This may seem a considerable trouble, but it is no more than building pits and trenches as described in the preceding article, and while the latter do no good, and often actual harm, the pipes serve their purpose without the slightest risk of harm.

In Fig. 5 is shown the method of ventilating a basement floor on the same principle, but here, owing to the air not having a direct entrance, double the number of air-bricks are necessary to make up for the deficiency. If the walls are solid, the tubes can be built in, in the same way as shown in Fig. 3. Basements are usually lighted by means of windows opening into an area, as shown by dotted lines in Fig. 5. One or more air-bricks can be inserted in the area, being kept up one course above the bottom to prevent them acting as drains as well as air inlets. In basements which have wood floors badly infested with dry rot a cure is very difficult to effect; in such cases, wood blocks laid on concrete are advisable.

It will be noticed that in the accompanying drawings hollow walls are shown in all cases but one. The reason for doing so is that the cavity in hollow walls forms an excellent ventilating shaft, especially if air-bricks are inserted at the top as well as at the bottom, as they should be. Some authorities condemn hollow walls as being weak, but if properly tied together they are as strong as solid walls, and far better for many reasons.

The sleeper walls on which the joists are supported should be built not less than 6in. away from the main walls, perforated as shown in the preceding article; the bond should be placed on them dry, not bedded with mortar, which is quite unnecessary, and often the cause of decay. The ends of the joists and the outside joists should be kept clear of the walls, the former fully 1in. and the latter 3in. The floor boards should be kept ½in. away from the walls at the ends and the sides. Damp courses should not on any account be omitted, either in outside, partition or sleeper walls, and in such cases as those shown in Figs. 2, 3 and 5 two damp courses should be used—one above the ground line in the usual way and one below the joists. It is the neglect to do this that is often the reason why joist ends become decayed.

The recommendations made may in some cases seem extravagant and needless, but it should be noted that a sovereign spent at the beginning may before many years have passed be the means of saving an expenditure of ten pounds. The old proverb says: "Don't spoil the ship for a ha'porth of tar."

PREVENTION OF DRY ROT: METHODS OF SECURING VENTILATION IN DIFFICULT CASES.

New Patents.

These patents are open to opposition until October 22nd.

1899. — Keyhole Saws. — 16,921. J. E. FITCHEW, 498 Kingsland Road, London, N.E. The teeth of the saw are formed the reverse way, so that a cut is made when the saw is pulled towards the person using it.

Water-waste Preventers. — 20,470. C. D. MARTIN, Charlotte Place, North Street, Clapham, London, S.W. The object of this invention (for use with syphon discharge cisterns) is to obtain silent action and to simplify construction. Within the cistern and below the normal water-level is a closed chamber with a lift valve at the bottom and a cylinder at the top, the piston in the latter being operated by a counterbalanced lever. A pipe leads from the top of the chamber to the syphon discharge pipe.

Gas-heated Water Heaters.—20,604. E. W. T. RICHMOND, Summercourt, Romford, Essex. The gas and the water are turned on simultaneously by a handle common to both supplies. A pilot light is used, and is arranged so as to first move away from the burners in order that it may be lighted, afterwards moving back to the main burner, and so lighting that.

Filter Presses for Sludge.—20,809. G. MACDONALD, 40 Dalmeney Road, Tufnell Park, London, N. In this filter press the piston is impelled by the sewage for the purpose of straining or filter-pressing the sewage enclosed by the previous operation on the other side of the piston. The action is alternating.

1900. — Roofing Tiles. — 90. E. HUPERTZ, 82 Mastricherstrasse, Cologne, and P. BREIDENBACH, Müllers-Ommer Linde, Cologne, Germany. The roof is perfectly flat—without raised parts—and the tiles which form it have a water collector at their upper ends, a small gutter being provided to direct the water straight down the roof.

Steam Heating. — 12,605. J. RUSSELL, 22 Charing Cross, London, S.W. The object of this invention is to prevent the passage of the steam into the return portion of the system and to avoid short circuiting, whilst permitting the continuous escape of air contained in the condensed vapour and the escape of condensation water. A partial vacuum is formed in the return system and a float valve for condensed water is provided in the outlet of each radiator. This valve is operated by the accumulation of water itself.

The following specifications were published on Saturday last, and are open to opposition until October 29th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—17,284, DEACON, sash bar for glass roofing. 17,382, KIERSCH, method of glass mosaic decoration. 17,552, TURNER AND DEWHIRST, means for polishing steel, wood and other substances. 18,310, CAMPI AND LAWRENCE, apparatus for cutting, carving, &c. 19,270, BOULT (*Goldschmid*), method of purifying water gas. 19,445, BLONDEL, WEISSMANN AND WYDTS, electric-lighting systems. 19,891, READ, street-orderly bins. 20,062, BLAIR, BLAIR AND BAILLIE, evaporators, &c., for reducing fresh water from salt or impure water. 20,615, BUSH AND JENKINS, electric safety apparatus for lifts and elevators. 20,897, R. BRIDGE, hanging brackets for supporting and providing bearings for shafting. 20,906, MUNRO, WOOD, BRECKNELL AND ROGERS, trolley standards used on cars or waggons electrically propelled from an overhead wire. 21,211, PAWSON, stone saw frames. 21,344, BEAMAN, refuse-consuming furnaces or destructors. 21,353, HOBBS, fire- and sound-proof floors and ceilings. 21,920, WOODWARD, drawing compasses. 21,980, MACKEY, door furniture. 22,485, WESTON, automatic fire sprinklers. 23,514, EADES AND ALLDAY, crab winches and other hoisting and lowering appliances. 24,345, OPPENHEIMER (*Actiengesellschaft Mix and Genest*), plugs for wall sockets. 24,868, KÖNIG, drying apparatus.

1900.—2,391, WOOD, burners. 7,185, FEHSE, support for incandescent mantles. 7,616, GROPPLER, compound for disinfecting purposes. 8,483, GRUBE, gas and vapour burners. 8,871, EWEN, manufacture of prismatically-ridged glass. 10,009, DE SILVA, window-blind furniture. 10,799, EVEREST AND OWEN, combination grinding mill. 10,964, BOULT (*Hinz*), roasting or calcining apparatus. 11,740, JACOBI, apparatus for moistening, cooling and purifying the air in rooms. 11,798, BÖTTGER, building arches with new bricks. 12,407, WALES AND WYMAN, apparatus for shifting belts from one pulley to another. 12,813, REICHARDT, sharpening machine. 13,116, KITE, service lifts, hoists, &c. 13,156, KAEFERLE, method of producing hollow cast-iron heating bodies for steam and hot water. 13,270, WARSCHAUER AND RITSCHEL, air-moistening devices for fans or ventilators. 13285, HOWSON, seat attachments for water closets. 13,287, KÖRTING, sewage boxes for sewage systems.

Builders' Notes.

Mr. Thomas D. Brooks, of York, has been appointed building surveyor to the Hull School Board.

Mr. William Henry Ottewill and Mr. Richard Corben, carrying on business as builders and decorators, at Maidstone, in the county of Kent, under the style or firm of "A. N. Pryer and Co.," have dissolved partnership as and from September 1st, 1900. All debts due and owing to or by the said late firm will be received and paid by Mr. M. L. Crow, Tunbridge Road, Maidstone.

An Example of Roman Plumbing.—At Chester a piece of lead piping supposed to have been laid about the year A.D. 79, when Agricola governed the province of Britain, and used for conveying water to the Roman camp, has just been discovered. Last October some similar lead piping was unearthed at this spot, but special interest attaches to that now brought to light as it bears the words "Julio Agricola," which completes an inscription of which fragments were before known.

The Late Alderman White, of Birmingham, whose death occurred last week, joined the City Council in 1875, when the corporation initiated their now famous improvement scheme, which was destined to sweep away the series of unwholesome rookeries which formed the heart of Birmingham slumdom. He became the chairman of the improvement scheme committee for five years. After nine years' service in the council Alderman White was elected mayor.

Death from Treading on a Rusty Nail.—Mr. Samuel F. Langham, the City of London coroner, held an inquest at St. Bartholomew's Hospital last week, with reference to the death of John William Smith, a scaffolder, of 26 Steel Lane, Acton Lane, Harlesden, who died from tetanus caused by treading on a rusty nail. It appeared that at some new buildings in course of erection at London Wall carpenters had put up a scaffolding, but had not knocked down the nails which protruded. On one of these, which stuck up an inch, the deceased trod, as he did not notice it. The nail went right through the sole of his boot and penetrated deeply into the foot, which became very inflamed, and eventually he had to become an inmate of the hospital, where he died the next day. The jury returned a verdict of "Accidental death."

A Builder Imprisoned for Stealing Water.—At the Central Criminal Court on Wednesday last Joseph Holland, a well-known Leytonstone builder, was convicted of having stolen 900,000 gallons of water, drawn from the East London Waterworks Company's mains. The prisoner was engaged in building operations at Leytonstone, and it was alleged that he was party to the surreptitious laying-on of a water supply for building operations from a domestic supply some distance away, whereby he sought to elude the charges of the Water Company. The defence was that the prisoner was innocent of the fraud, and that so soon as he discovered it he ordered the supply to be cut off, and offered to pay. The Recorder said the evidence against the accused was overwhelming, and sentenced him to nine months' imprisonment in the second division.

A Portable Asbestos House for Count von Waldersee.—Part of the equipment of the German expeditionary force for China is the portable house for the use of Count von Waldersee. This novelty was built by a Hamburg asbestos firm. The framework is of wood, and is filled in with a new kind of asbestos slate, which is also used for the roof. The outside walls are double, with an air space between them. The entire building has a frontage of 56ft., and is about 16ft. high. It contains seven good-sized rooms, three to the front and four to the back. The door opens into a hall, to the right of which is the orderlies' room and to the left the field marshal's work-room. Beyond this is his bedroom. From this is reached the bath and dressing-room and the two rooms occupied by the personal adjutant. The entire building can be dismantled in three hours and set up again in eight hours.

EARTHQUAKE-PROOF WOODEN BUILDINGS.*

THE construction of earthquake-proof buildings differs in method according to the kind of materials used. But the earthquake-proof buildings which will be built at Sakata, Yamagata Prefecture, where great havoc was wrought by earthquake last October, will probably, in view of the conditions of the locality, be constructed of wood. As these structures will comprise public buildings, shops, and city and country houses, the arrangement of rooms will be necessarily diverse, some being simple and others complicated; the outward appearance of the buildings will also differ, for some of them may be of one storey and others of two storeys. The principle of construction, however, cannot but be one and the same, and therefore we give herewith a condensed statement as regards the method of constructing earthquake-proof wooden buildings.

Construction of the Foundation Works. — Materials for the foundation work may be one of three kinds, namely, (1) concrete, (2) broken stone, (3) stone blocks. The concrete may be made either of cement or of lime, or of both cement and lime mixed; any one of which is better than either the second or the third kinds. Cement-concrete is best of all. In constructing the foundation work, if the soil should be found too soft or damp, piles must first be driven to afford a firm foundation; but the driving of piles should be dispensed with in places where the soil is dry. For the foundation or footings to be placed upon the groundwork, flat broad stones should be selected, and they should be buried in the earth for half of their height.

Construction of the Framework. — In constructing an earthquake-proof building, it is deemed advantageous to use either foundation-sills or foot-bracers, and the method of using them may be seen in an ordinary foundation-sill (as in Fig. 1); in a foot-bracer applied to one side of a pillar (as in Fig. 2); in a foot-bracer stuck between the two pieces of timber forming a double pillar (as in Fig. 3); and in two foot-bracers so fixed as to embrace both sides of a pillar (as in Fig. 4). Should more stability be required in the case of Fig. 1, the connection of the pillar and the foundation-sill should be firmly joined by means of iron clamps or straps. In adopting the methods shown in Figs. 2 and 4, foot-bracers having a thickness of more than one-third of the respective pillars should be used. In case of adopting the method shown in Fig. 3, one solid pillar should be used at each corner of a building, notwithstanding the pillar may be weakened by foot-bracer. Still another method is to use pieces of timber as a pillar, as shown in both Figs. 5 and 6. In that case, blocks of wood just fitting the space between the pieces of timber should be inserted at every two or three feet, and should be

* Report of Earthquake Investigation Committee, Japan.

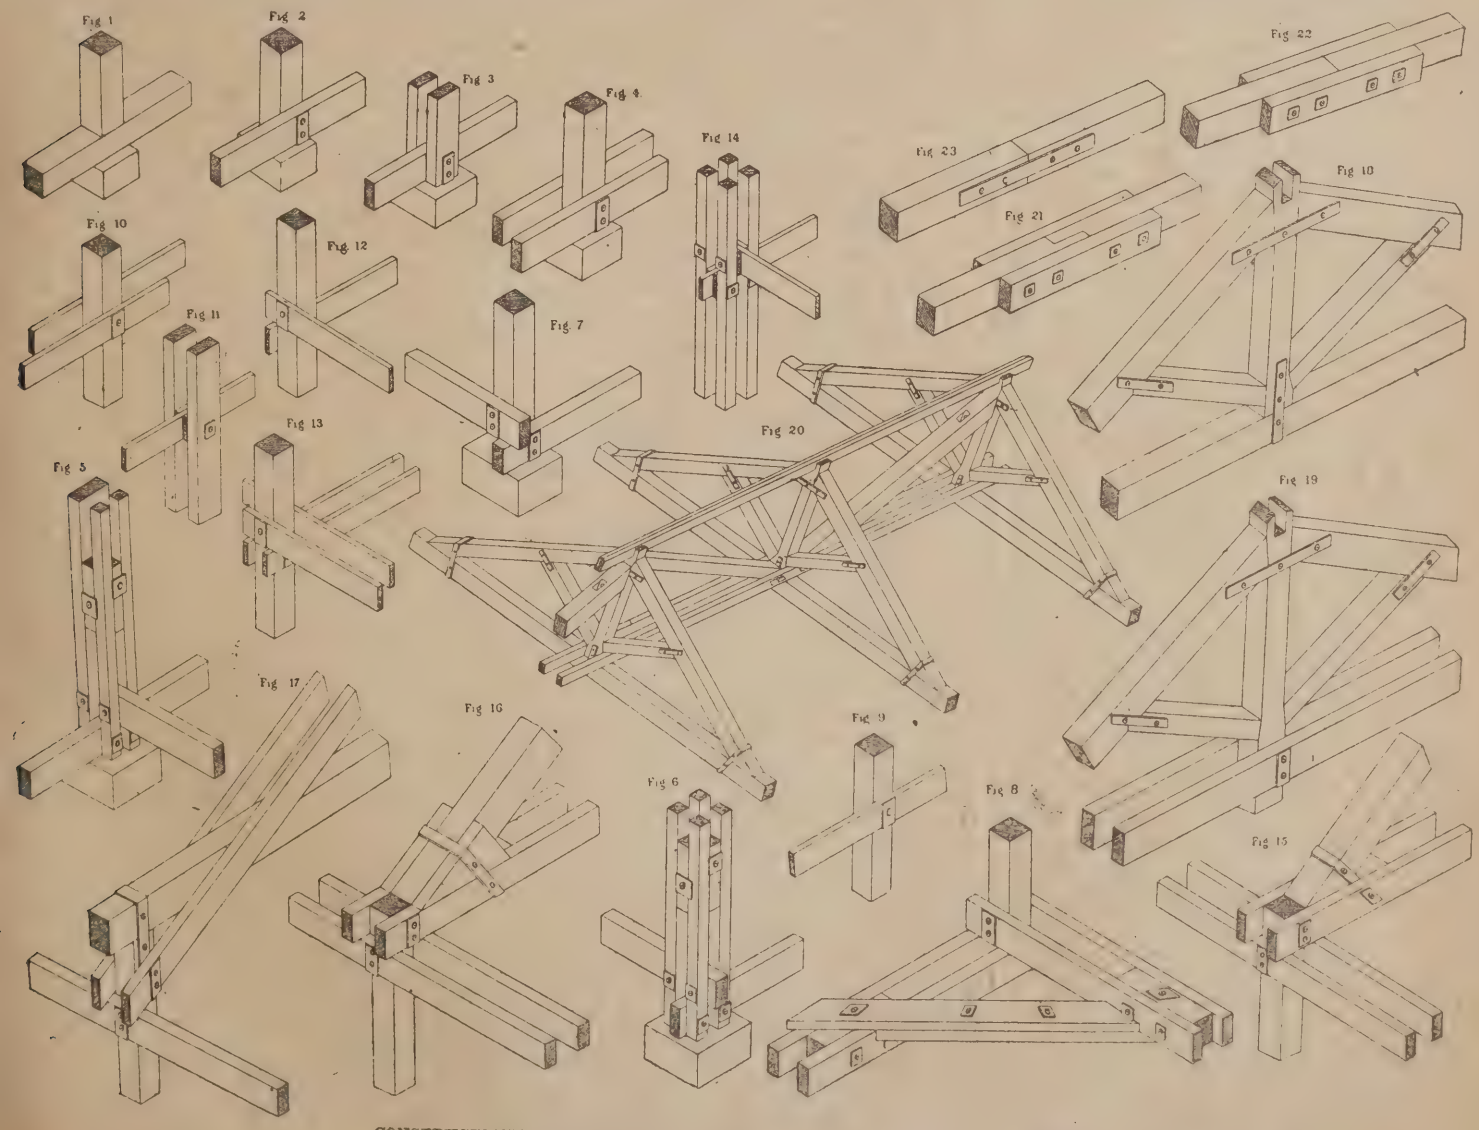
fastened with a metal bond, wire or bolt, in order to prevent the pillar from bending or twisting.

It is desirable that foundation-sills and foot-bracers should be crossed with a brace at the four corners and fastened with bolts, as in Figs. 7 and 8. One or two through-bracers should be used as in the case of foot-bracers and fastened with bolts, as in Figs. 9 and 14; but in the cases of Figs. 11 and 14 the blocks of wood should be inserted at both surfaces of the through-bracers.

In the intermediate spaces between the pillars where no window or door is to be made, or where outward appearance is of no particular consequence, struts should be placed and fastened to the through-bracers and pillars with bolts. The lower and upper grooved beams, respectively, in which doors or shutters slide should be fixed to the pillars simply with screws, if possible, in order to avoid cutting into the pillars and weakening them. Horizontal pieces of timber used in the framework of a building should be attached to the surface of the pillars and fastened with bolts. Moreover, the weak point of the construction at the four outer corners should be strengthened by jointing the horizontal pieces with L-shaped metal straps. In places, however, where outward appearance is of no consequence, the pieces should be overlapped at the ends and bolted to the pillars. In regard to the method of combining with the pillars such lateral timbers as floor-beams and so forth, if possible, only one or two of the timbers should be used in a similar way, as in the case of foot-bracers. The connection of top ties and pillars should always be made in the same way as that recommended for pillars and their foot-bracers. The combination of the roof and walling of a building should be effected as in Figs. 15, 16, and 17, e.g., either by holding the upper part of a pillar between double tie-beams placed on wall plates, or by using double rafters and letting the tie-beam fall upon the tenon of a pillar. In both cases bolts or iron straps should be used in fastening.

Construction of the Roof-framing.—Materials of too great a dimension should be avoided in the construction of the roof, and the construction should be as in Figs. 15 to 20, using such scantlings as will be just large enough to bear the weight of the roof itself together with the pressure of the wind and the weight of the snow; and all connections should be effected with thick wire, iron scraps or bolts. Between the principal rafters struts or braces, or both, should be used, and the whole frame of the roof should be bound, as in Fig. 20, with iron clamps or bolts.

For resisting earthquake shocks, a light roof is preferable, and therefore all roofs should be made as light as is consistent with their function of keeping out the wind and cold. In case of using tiles, it is better to fasten them with nails or wire.



Joints.—Joints in whatever part of a building should be made as simply as possible, for though a complicated joint may seem strong, yet in reality it is weak. It is desirable that a joint should be made as in Figs. 21, 22 and 23, wood or iron fish-plates being fastened with bolts. In making a tenon also, the simpler its form the better. In case a jointed pillar is to be substituted for an ordinary one in building a two- or three-storeyed house, the joint of such post should be made at a point about 2ft. or 3ft. either above or below the upper floor-line of the house. Foundation-sills, foot-bracers, floor-beams and tie-beams should all be fixed so as to project somewhat at their outer extremities.

Attachment of a Porch or a Shed with the Main Building.—As regards attaching a porch or a shed to the main building, the old method of tenoning or nailing should be entirely abandoned, as it is dangerously faulty, and the two structures should be joined in the same manner as top-ties and pillars are connected.

Materials.—As the quality as well as the size of iron materials has an important bearing upon the construction of a building, serious attention must, of course, be called to the selection of materials and also to the number and distribution of bolts. Besides, the size of washers should be considered, large ones being preferable to small. Wooden materials are subject to shrinkage, owing to which the bolts lose their tightness, and therefore well-seasoned timbers should be selected.

Conclusion.—The most essential points in regard to the construction of an earthquake-proof wooden building lie in the method of building the foundation; in the preservation of the entire power and function peculiar to each timber intact as far as possible, and, in case some weakening be unavoidable, reinforcing it by the application of iron that is much stronger than wood; in the use, wherever possible, of triangle frames, in accordance with the principle that a triangle affords an unchanging form of structure; and, finally, in the additional strengthening of the whole framework by the further use of iron materials, thus combining all the parts into a stable and united construction.

A People's Institute for Southwark Park.—The Rev. J. Wallace, vicar of St. Crispin's, Southwark Park, S.E., appeals for help in building a "People's Institute" for the benefit of the dock labourers and costermongers in his poor parish. A site has been obtained and plans have been prepared by Mr. C. Harrison Townsend for a building which will cost £850. Subscriptions may be sent either to the vicar or to Sir W. Roberts-Austen at the Mint.

CONSTRUCTIONAL DETAILS OF EARTHQUAKE-PROOF WOODEN BUILDINGS.

Correspondence.

Leaky Windows.

To the Editor of THE BUILDERS' JOURNAL.

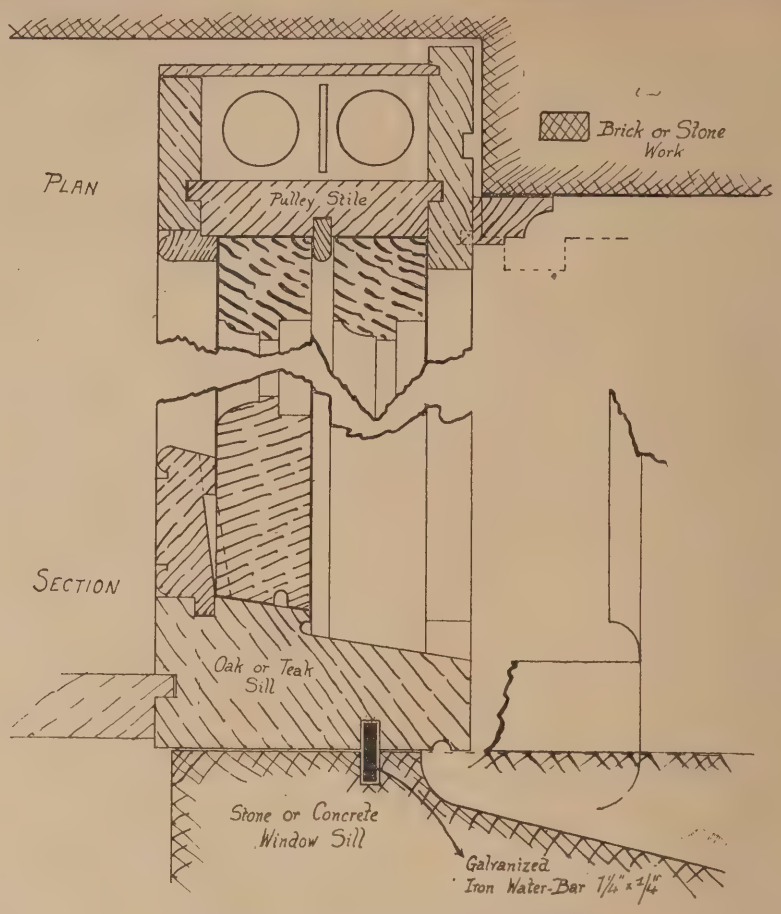
WEST HAMPSTEAD, N.W.

SIR,—Referring to the article on "Leaky Windows" published in your issue for August 22nd last, by Mr. Campbell Douglas, F.R.I.B.A., the breakwater feature F, on his plan, may have something in it, though this "breakwater" does not obviate the microscopic cracks on the screeded face of reveal. So far as the bedding of case sill is concerned, no architect would think of bedding a wood sill on a stone or concrete one without an iron water bar run the full length of the case sill, and this thoroughly bedded in soft red and white lead putty into the stone and wood alike. As to the decay of window sills (sash frames), it is as important to paint the bottom of the case sill before the sash frame is fixed in position as it is to paint any other part of the frame; also the pulley stiles and linings should have a brush of paint applied to the lower joints and fixings when being put together. It is also a good precaution to have a groove on the outside face of the lining which abuts on the reveal so that the soft screeding of lime and hair mortar shall fill it up and break the straight line on the same plane. There are also other methods, such as fixing a fillet or architrave on the outside of frame as shown, tongued into sash frame and scribed to brick or stone reveals. As to Mr. Douglas's contention of giving up the broad sill, because it is not required to make the frame rigid, I am afraid he has little acquaintance with the practical construction of a sash frame, otherwise he would not advise that. The accompanying illustration may be of interest to him and to others.

Yours truly,
H. PENDLEBURY.

To the Editor of THE BUILDERS' JOURNAL.

GLASGOW.



SIR,—There is really little to say in reply to your correspondent's statements. I fail to see any evidence that he has apprehended the natural laws which must be dealt with in a more scientific method than has hitherto prevailed in the "use and wont" method.

The sketches which accompany my paper do not show everything, e.g., the lath separating the two sash-weights and their enclosure at the back; the use made of the groove run along the window sash of the case sill, whether it should be fitted with what your correspondent calls "an iron water bar," or whether, as some think, this might be better done with a different material, and in a slightly different manner; the use of the fillet fixed on the outside of the frame and scribed to the reveal. These things are strictly speaking *non-essentials*, and I have dealt almost exclusively with what is needed to cure the evils of the present system. Possibly your correspondent may have fancied I was ignorant of the features on which he lays stress.

I also infer that he is somewhat aggrieved by my occasional use of Scotch terms, when they differ from what he is accustomed to. But it is a more serious matter when I perceive that he does not take in what I call the essentials, namely, (1) the *breakwater*, for although he is good enough to say it "may have something in in it," he adds that it "does not obviate the microscopic cracks," whatever that means. (2) He is rather hard on me about the narrow case sill, and does not seem to have observed that it is a theory which I have successfully worked out in practice, and therefore I recommend it; it is, however, quite possible he may have had more windows made than I have had. (3) He does not seem to understand the scientific basis on which my V-shaped channel on the inside of the sash and case sills rests.

I will only add that it is somewhat depressing to see that one who seems to be what is called "a practical man" appears to be unable to realise the evils of the system which has hitherto prevailed, and gives no evidence of being able to appreciate the reasons for my attack on what has been, I suppose, hitherto the almost universal system of constructing sash windows and the stone sills they rest upon.

Yours truly,
CAMPBELL DOUGLAS.

CONSTRUCTION OF WATER-TIGHT WINDOWS.

Architects' Assistants' Salaries.

To the Editor of THE BUILDERS' JOURNAL.

SOUTH SHIELDS.

SIR,—Being one of the priggish assistants referred to by "H. T. B." in your issue for last week I have followed with great interest the correspondence on this matter.

Assistants are poorly paid, it is true, and not till they insist upon getting a minimum salary of 30s. will they be properly paid. I for one have had no cause to complain, having received a reasonable salary since the completion of my articles. I would like to ask "Pen" what time a mason, joiner, or any other workman, has for preparing drawings, even if he had the ability: in the majority of cases they do not know their own work. If he remains at his trade, after perhaps fourteen years' experience, and starts to prepare plans, he will find himself an architect, and of this class of architecture we have some bright specimens. I would also like to point out that a man who is only a draughtsman cannot obtain employment in an office of any repute as an architectural assistant: he is engaged only as a draughtsman. One of your correspondents asserted that all architects were badly paid. Architects in practice have no more cause to complain than any other professional men. If the practice is a good one, the remuneration is also good. I therefore say to all students of architecture "push on"—the profession is not so black as it is painted; for all able assistants there is yet employment to be found, and as long as the world lasts there will be architects.

Yours truly,
STUDENT.

A new Mission Hall at Hove has been built at a cost of about £2,000. The hall has been erected in connection with the Cliftonville Congregational Church in Rutland Road, Hove, and is to be known as Rutland Hall. The building seats 300 persons, with class rooms.

THE BRITISH ASSOCIATION.

(*Concluded from page* 117, No. CCXCII.)

SECTIONAL meetings were held on Monday, Tuesday, and Wednesday, the 12th, 13th, and 14th inst. On Monday, in the Mathematics, Physics, and Astronomy Section, Mr. J. W. Thomas read a paper on the "Physical Effects of Winds and their Influence upon Ventilation." Mr. Thomas's main contention was that ventilators of the ordinary type ought to be sheltered from the wind as much as possible, instead of being exposed to it, the all-important element of outside pressure on the ventilating power of a chimney being usually overlooked.

Municipal Trading.

In the Economic Science and Statistics Section, Mr. Arthur Priestman read a paper on "Municipal Trading." He said that in the returns of the municipal corporations there was very material evidence of the vast increase of municipal trading. The debt incurred by local authorities had increased from £60,000,000 in 1838 to £262,000,000 in 1898; and of this £87,500,000 was estimated to be on account of municipal trading. Thus, nearly four times more capital was employed in municipal trading than was employed by the co-operative societies. There was a growing feeling that the responsibility for the sordid conditions in which so many persons lived should be regarded as a charge on the whole community. It was not sufficient that our streets were well paved, drained and lighted, and that the safety of our people was maintained by an ever vigilant police force, but our citizens must be well educated, afforded every opportunity of healthful recreation, their food must be inspected, the causes of disease must be removed. Within the past three years 300 separate competing firms have been formed into 13 trusts, with £79,500,000 capital. We were face to face with private trading itself becoming a monopoly through combinations of capitalists; and we were in the position of choosing between the Scylla of private monopoly and the Charybdis of municipal monopoly. To limit municipal trading would be to put a stop to the natural development of collective enterprise and to

hinder the progress of the people towards a higher, a nobler and a happier life.

The Hon. Auberon Herbert's paper on "Municipal Building for the Overcrowded" was read in his absence by Mr. E. Cannan. The writer said we could either supply this want by the system of free trade or by enlarging once more the area of compulsion. Undoubtedly compulsion was easy and convenient, but did it not tend to bring serious evils with it—disagreement, careless and expensive management, corruption? Looking round at Europe to-day we saw a general failure of highly-organised systems of compulsion. Almost everywhere minorities were in revolt against majorities. It had been discovered that majorities were very keen to pursue their own particular interests—that to be in a minority meant to lose all control, perhaps for many years, over one's own mind, body and property. The remedy was for our municipal bodies to develop a voluntaryist side to their work. Instead of always compelling, let them sometimes persuade us to help them in some of their many duties. In this very matter let them appeal to us to form building companies, with shares placed at a low amount, so that all might join.

Electric Street Traction.

In the section relating to Mechanical Science Mr. J. G. W. Aldridge contributed a paper on "The Automobile for Electric Street Traction." After a reference to the drawbacks and difficulties incident to the usual means of carrying street traffic, he described a system which had been devised in France. The electric motor vehicles derived power from a pair of trolley wires supported on short brackets along one side of the road; on these wires ran a two-wheel trolley containing a small electric motor for its own propulsion, the whole being connected to the omnibus by a flexible cable attached to a pole on the roof, devices being also provided to keep the cable sufficiently taut and to obviate any risk of derailing the trolley. The system was in actual use in the outskirts of Paris.

Sir William Preece read a paper on "The Manchester and Liverpool Express Railway."

The Demerbe Tramway Rail.

Mr. William Dawson, deputy engineer to the City of Bradford, next read a paper on "Recent Tramway Construction," the chief feature in which was a description of the Demerbe rail. This rail, which differs entirely from other types, consists of a hollow trough rail. The fishplates, by which the different lengths are joined, are placed inside under the ends of the rails and exactly fit their contour, the point of application being immediately under the head of the rail. By means of cotters the fishplates are driven close up to the underside of the rail. When in position the rail is completely filled with concrete. The tie-bars are flat. The rail is inserted into two oblique grooves, one of which is cut so as to exactly fit its outer side, while the other is wider to facilitate its introduction. The space left is filled up with a wedge of soft steel. In this way the rail becomes attached to the concrete foundation and is actually a part of the carriage way. The first cost was shown to be cheaper than ordinary rails, though this was considered by the author as of secondary importance to the saving in maintenance. The life of the rail he would estimate to be about 20 years.

Electricity Generating Stations.

A paper by Mr. Alfred H. Gibbings, former electrical engineer for Bradford, on "The Design and Location of Electric Generating Stations," was taken as read. He stated:—All design and arrangement in regard to electric works must be with a view to securing the highest average efficiency together with reliability in operation. Economical production is only possible where both the generating costs and the standing charges are reduced together as the load increases and the system extends. In constructing generating stations the following points should be attended to: (1) The machinery must be designed to generate at high voltage, suitable for transformation at sub-stations to meet all possible requirements; (2) the type of all boilers, engines, electric generators switchboards, &c., must be simple and mechanically reliable; (3) all complicated gear and fanciful combinations, such as might lead to a possible breakdown, must be avoided throughout; (4) as far as possible the different units of the respective types of plant should be uniform in design and arrangement and made to one standard size; (5) the buildings should be devoid of all unnecessary embellishments, nor should an attempt be made to confine too many departments under one roof; (6) the location should be such as to ensure a cheap and ready supply and delivery of fuel, and where condensing can be accomplished efficiently and inexpensively.

On Tuesday, in the Chemistry Section, Dr. J. B. Cohen, of the Yorkshire College, Leeds, contributed a paper on "Smoke," which was read by Dr. Dawson. Every day twenty tons of soot went into the air in Leeds, of which a ton fell and 20lb. to 25lb. stuck. This meant a minimum loss of fuel in the form of soot to the value of £300 a year, and to the loss account he added a heavy domestic washing bill. Dr. Cohen complained that municipalities did not seriously handle the smoke question. Properly-constructed boiler furnaces, when properly fixed, need not smoke. He believed that scientific smoke inspectors, appointed through the Local Government Board, would be an equal boon to the manufacturer, who would soon be led to discover, as many had already done, that a material economy could be effected by abolishing smoke.

Bradford Sewage.

Mr. F. W. Richardson read a paper on "Bradford Sewage and its Treatment." Bradford sewage was among the worst in the kingdom, owing to the influx of woolcombers' waste-products and of dyeworks effluents. It required much precipitant and produced a great deal of wet and settled sludge. Difficulties arose from the peculiar emulsive character of wool-grease and the excessive amount of nitrogenous impurities. Various experiments had been tried with it, with briefly the following results:—Lime gave a clear but bad effluent with a large amount of sludge; copperas, followed by lime, produced a turbid but better effluent; aluminia ferric, i.e. aluminia sulphate, gave unsatisfactory results at a high cost; acid ferric sulphate gave a high degree of purification, but with an acid effluent; neutral ferric sulphate yielded as good results but with less acidity; and basic ferric sulphate gave a 62 per cent. purification and a neutral or slightly alkaline effluent, but proved costly. With bacterial treatment nitrification ensued and 70 per cent. purification might be obtained, but the grease soon choked the filters. There could be no doubt that if the woolcombers' suds and effluents were entirely removed the whole of the city's sewage could be treated biologically, with an immense saving in the cost of chemicals and the treatment of the sludge. Failing the elimination of the wool-suds, the best method would seem to be a preliminary treatment with the cheapest precipitant obtainable and the biological purification of the effluent either on bacteria beds or on land, preferably on both.

Mr. W. Leach next discussed the treatment of woolcombers' effluents. Chemical precipitation and mechanical treatment not having proved satisfactory, he proposed to concentrate the suds by evaporation, then treat them centrifugally, when the wool-grease would be separated in a semi-solid form and the potassium carbonate remain in concentrated solution, from which it could be recovered by evaporators. The final products were thus pure wool fat, potassium carbonate, distilled water and sand.

Using Sewage Sludge.

Professor W. B. Bottomley, M.A., F.C.S., read a paper on "The Utilisation of Sewage Sludge." In experiments in precipitation which he had made he employed a crude phosphatic rock, too impure to be used in the ordinary process of superphosphate manufacture. The rock was pounded and then treated with sulphuric acid slightly in excess of the amount necessary to combine with the oxidations of iron and aluminium present; and the substance thus obtained—called phosalite—was tried both as a precipitating agent for sewage and as a pressing agent for sewage sludge, the sewage of Glasgow and Chiswick being treated in the experiments. Experiments bore out the conviction as to the increased manurial value of the sludge. By the use of phosalite as a pressing agent for sludge he obtained economy of lime, a much improved press liquor, and a greatly enhanced manurial value for the sludge.

Professor W. H. Perkin, jun., F.R.S., was of opinion that in the present methods of treatment screening removed little or no organic matter, while in septic tanks organic matter was destroyed, so that very little would be left to render any sludge of manurial value.—Mr. Arthur J. Martin pointed out that the author confused road grit and screenings with sludge. They were really different, the former in fact being removed before septic treatment. Any residue removed from septic tanks should be regarded rather as a soil than as manure.

In the Mechanical Science Section, Mr. E. Kitson Clark read a paper on "Machine-Shop Buildings." He advocated generally a standard width of 50ft. for such buildings, and that they should be all on one floor. He thought that many modern workshops were extravagantly costly.

Yorkshire Antiquities.

On Wednesday, in the Anthropology Section, Mrs. Armitage read a paper on "Some Yorkshire Earthworks." She explained that the type to which she referred was found all over England and in parts of Scotland, Ireland and Wales. The type was a very marked one; it consisted of a round or oval hill—frequently artificial, though a natural hill or rock was sometimes utilised—and scarped by art. The hillock was nearly always surrounded by a ditch and bank, and had attached to it a base-court, sometimes round or oval, but more frequently rectangular, which also was banked and ditched. These earthworks had occasionally been attributed to the Romans and to the Scandinavians; they had been described as sepulchral and as moot-hills, but evidence is lacking in support of these descriptions. The most popular theory, however, is that they were reared by the Saxons themselves when they were resisting the attacks of the Danes in the ninth and tenth centuries. The earthworks in question were feudal fortresses, and their rise in England corresponded with the introduction of that more rigid feudalism which the most recent research was tending to associate with the Norman Conquest. There were about fifty mounds known in the county; and there may have been many more, for where a modern house occupies the site of an ancient castle the motte is generally destroyed.

Mr. Butler Wood, in the course of a paper on the pre-historic antiquities of Rombalds Moor, said that that area still consisted of about 50 square miles of country which had not been disturbed since primitive times. Flint and stone implements had been found on the moor, consisting of arrow-heads, spear-heads, knives, scrapers, awls, hammers, and saws. They were all of late Neolithic type, and many were exquisitely chipped. Only about half-a-dozen bronze implements had been found, and these were at a lower level than the flints. All the barrows on the moor were of the round type. On Bracken Hall Green, within four miles of the Bradford Town Hall, there was an interesting double circle of stones. Near Horncliffe shooting-box there was a double circle of upright stones 43ft. in diameter. On the north side of Baildon Hill there were two sides of an ancient earthwork, and there were two extensive camps at Counter Hill, near Addingham. Some bowl-shaped cavities on Baildon Hill, about 10ft. deep and 20ft. in diameter, were suggestive of pit dwellings.

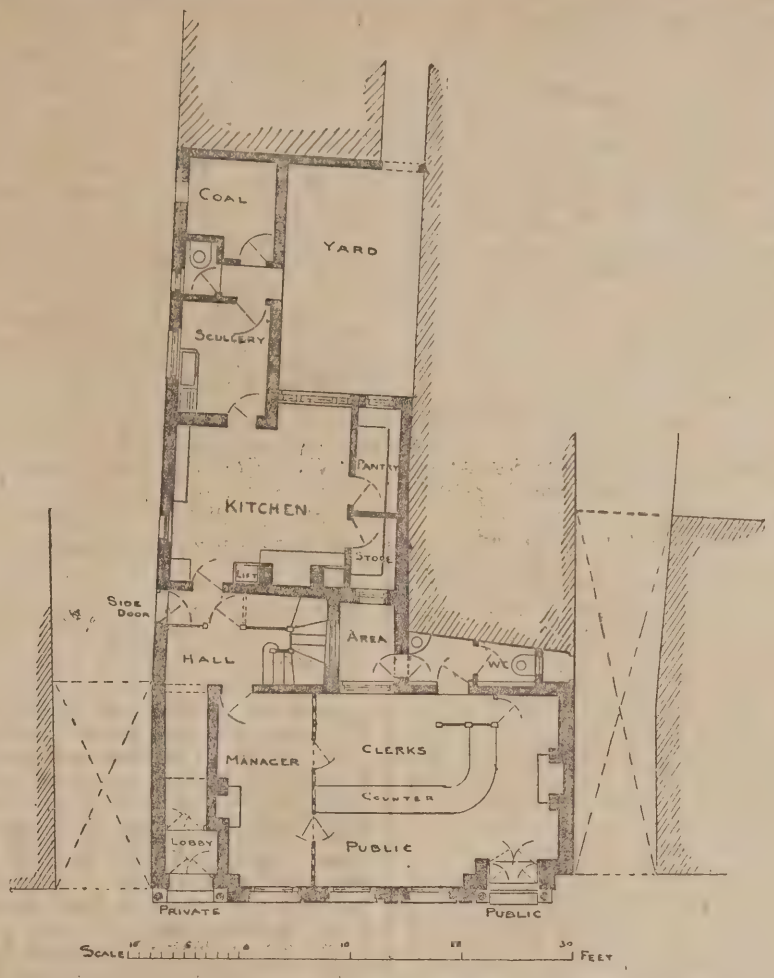
A Memorial Window in Armagh Cathedral has been erected in memory of the Most Rev. Robert Samuel Gregg, D.D., the late Primate. The window was designed and erected by Messrs. Heaton, Butler and Bayne, of London. The figures typify the prominent features in the life of the late Archbishop. It is a two-light window, on one side at the top being the figure of Jehoiada, and below a group in which is represented his death; and on the other the figure of St. Paul preaching, and below it a group showing the Apostle in the act of confirming.

Professional Practice.

Barnstaple.—The foundation stone of the new "Alfred Miller" Institute was laid recently. The building is the gift of Mr. Alfred H. Miller, J.P. Mr. James Crocker, F.R.I.B.A., is the architect. The contractors are Messrs. Sanders and Karslake (local builders), and Mr. A. G. Travena is the clerk of the works. The building, which will cost about £5,000, is designed in the Early English style. It will be about 128ft. long by 54ft. wide, the top spire rising about 60ft. from the ground level. The walls will be of Wellington red bricks, with stone dressings, and the window arches, &c., will be picked out in the brighter red rubber brick, while the roof will be of red Bridgwater tiles. On the ground floor will be four large rooms, 25ft. by 19ft. 7in., which will be adapted as reading and recreation rooms for the men and women, with complete lavatory and cloak rooms, &c., attached. A large corridor, 82ft. long, runs the whole length of these rooms, French casements opening out on a verandah 6ft. or 7ft. above the ground level. An external slope will be laid out with ornamental flower beds. At one end will be the caretaker's house, with parlour, kitchen, and necessary offices and yard, also the refreshment bar, with separate casements communicating with the corridor for the men and women. On the first floor will be a large lecture hall 82ft. by 25ft., with open rounded rib roof. At the higher end will be a large platform, 25ft. by 20ft., with a recess for an organ, and dressing rooms at the rear for the ladies and gentlemen forming the orchestra. These open into a corridor with lavatory, &c., accommodation, and are provided with a separate exit close to the caretaker's entrance on the south elevation. At the rear of this hall will be the bedrooms of the caretaker's house. One of the features of the building will be the three-storeyed 60ft. clock tower, surmounted by a circular red roof. A large three-faced clock will be placed in position, and the tower will be ventilated by Lobley's patent extract ventilators. The tower will also form the entrance to the lecture hall. The chief entrance on the ground floor will be on the south side, approached by steps with ornamental wings. Above the verandah, the full length of the corridor, 82ft., will be an iron balcony. Both the verandah and balcony will overlook the sports ground and pleasure field, and as such, no doubt, will be much frequented. The building will be heated by means of hot-water pipes, and, as at present proposed, lighted by gas, with the exception of the clock tower, where the illuminant will be electricity.

Honiton.—The new branch bank premises, Honiton, for the Devon and Cornwall Banking Company, Limited, of which we give illustrations on this and the next page, has been built from the designs of Messrs. Octavius Ralling and Lewis F. Tonar, architects, of Exeter. The base and plinth as far as the sills of the ground-floor windows are of Royal Blue Aberdeen granite, the dressings above being of Guiting stone. The filling above the first floor is of red Wellington brick. The general contractors were Messrs. J. W. and H. Childs, of Yeovil; the stonework and carving were executed by Mr. Herbert Read, St. Sidwell's Art Works, Exeter; and Messrs. Wilson and Son, of Cathedral Yard, Exeter, carried out the counter and internal fittings of the banking room from the architects' designs. The reception room and bedrooms for the manager are arranged on the first and second floors, a lift working between them and the kitchen.

Leicester.—The foundation stone was laid recently of a new wholesale vegetable and fish market in Halford, Wigstone and Yeoman Streets, Leicester, which is being erected by the Corporation. The new market, when completed, will stand on an area of about 3,850 sq. yds., and will contain, at the Halford Street end, a building having offices set apart for the officials of the market. The building is divided on the front below the first floor by a large central archway and road, for the use of vegetable carts and waggons. On either side of this archway entrance the offices have their entrances, direct from the street, while access is also obtained through doorways leading direct from the market. At each end of this building a lock-up shop is placed, and over the same, on a mezzanine floor, store rooms are provided. All the offices which will be used by the officials are situated on one side of the building. In a well-lighted basement there are offices for the inspector of weights and measures and the meat inspector. On the mezzanine floor are lavatories and conveniences. The superintendent's office has a central position on the first floor. There is a separate office also for clerks and collectors, while other offices are placed on this floor on both sides of the building for letting purposes. The heating of the offices on the upper floors will be by open fireplaces, whereas the basement offices will be on the hot-water system. All rooms will be supplied with fresh air from the outside by means of flues in the walls, and vitiated air will be carried off by the same. Provision is made for a boiler room in the basement. The floors are to be constructed of concrete supported by rolled steel joists and made fireproof. The other portion of the site is to be used by the wholesale vegetable and fish merchants. A roadway 23ft. wide will run through the market, and at the sides of this twenty-three vegetable stalls are placed, with offices over, each pair being approached by one staircase. Into Yeoman Street double doors are provided which will enable the stallholders to have goods delivered by these entrances. These stalls will be fitted with B. and S. folding collapsible gates, and are so arranged that two can be made into one large one if desired. Thorough ventilation is provided by means of louvres over the heads of the doors in Yeoman Street, and in centre windows on the opposite side of the building. The main walls of this market are carried on steel girders, the width between the walls inside being 50ft. The portions of the roof not glazed will be covered with boarding and pan tiles. Two large archways are placed in Yeoman Street, to be used as exits only for both markets. The fish market, the entrance of which is from Vestry Street, is divided into twenty-one stands, the division lines being marked by the columns supporting the girders carrying the offices over, and a curb is placed between each, so that independent swilling of the floors is practicable. The offices over are approached by circular



NEW BANK PREMISES AT HONITON, DEVON. OCTAVIUS RALLING AND LEWIS TONAR, ARCHITECTS.

iron staircases, one for each pair. Between the main walls of the fish-washing portion of the building, which is to be carried on an arcade of elliptical arches and piers, is a 51ft. steel span roof, covered with pan tiles, and having light introduced on the north side by patent glazing. A fixed lantern with louvres on each side runs the whole length of the building for ventilating purposes. Lanterns are also placed on the ridges of the vegetable market roof. The floor of this market, which is over the basement, is to be constructed of concrete, with rolled steel joists and girders, supported by steel stanchions. A refreshment room for the stallholders' use is placed on the first floor over the trolley-way, and is approached by a stone staircase. Adjoining this is a kitchen, which will be fitted up with range, sinks and other appliances. The total cubic capacity of the cold stores will be about 32,500ft., and it will be maintained at a temperature of about 25deg. Fahr. Washing hydrants will be placed at different points in both markets on each side of the roadway, and three fire hydrants will also be provided. The whole of the market will be lighted by electricity. The front building is to be faced with terra-cotta, having a plinth of semi-glaze; the dressings of the other external portions of the buildings and portion of the interior are of the same material, the facings to the markets proper being Woodville sand-faced bricks. The front has been designed in an early Elizabethan style. Mr. Walter Brand, A.R.I.B.A., is the architect, he having gained the first award in the recent competition. Mr. Thomas Herbert, of Welford Road, Leicester, is the contractor, and Mr. William Charles Lee the clerk of works.

Liverpool.—The promoters of the National Eisteddfod of Wales have decided to erect a pavilion in the first three bays of the North Haymarket from Juvenal Street, having an area of 32,000 square feet, which will be enclosed from the remainder of the market by boarded partitions. The interior will be divided into four distinct classes. The reserved area, which immediately faces the proscenium, will accommodate about 800 persons, and the first-class in rear of the latter will seat some 1,200 more. The second- and third-class seats, which will be arranged in the form of an amphitheatre, and gradually raised around the reserved and first-class areas, will seat about 8,000 persons, allowing altogether at a crush accommodation for at least 12,000 people. The platform and choir gallery will be at the Cazneau Street or west end of the pavilion, and in that position there will be sufficient room for a choir of 400 and a band of about 100 performers, allowing room on the platform for the presidents, officials, artistes, and others engaged in the proceedings. At the rear of this are the secretary's offices, the choir room, the artistes' dressing room, and the orchestral band room. In addition to the three bays already mentioned, which constitute the main pavilion, two other bays facing Cazneau Street will be utilised as crush room, cloak room, lavatories, post and telegraph offices, &c. The main entrance will be from Cazneau Street, through the crush room, from which will be provided entrances to all parts of the pavilion. In addition to these there will also be entrances and exits to the second and third-class seats from the open yard of the market in Fox Street. The contractors entrusted with the construction of the pavilion are Messrs. Woodhouse and Sons, of Nottingham, and the work will be carried out from designs prepared by the architects, Messrs. Richard Owen and Sons, of Liverpool, under the supervision of the clerk of works, Mr. W. Vaughan. The whole of the auditorium will be lighted by electricity.

Mattishall, Dereham.—A new chapel and schoolroom has just been opened. The building is in the Romanesque style, and has seating accommodation for 200, while the schoolroom will seat 120 children. The building is of red brick, relieved with white string courses and stone sills. It is lighted with six large windows with circular heads. In the front is a large centre triplet window, and a smaller one on either side, glazed with cathedral glass. There is an ornamental triplet porch. The roof is of slate, and is finished with iron finials on the gables. Attached to the chapel is the schoolroom, with a sliding partition between. The whole building is fitted with hot-water apparatus by Mr. C. Gunton, of Norwich. The fittings are of ornamental pitch pine. The rostrum is placed on a raised platform, framed in pitch pine filled in with metal panels, and finished with mahogany capping. The whole is enclosed with a Communion rail on iron stands. The roof shows the curved ribs and hammered beams. The moulded groynes are supported on ornamental stone corbels. The chapel and schoolroom has six powerful central draught lamps of a new design. The architects are Messrs. Kerridge and Sons, of Wisbech, and the work has been carried out by Mr. Lebbel King, contractor, of Mattishall. The whole cost is estimated at £750.

GROUND-FLOOR PLAN OF NEW BANK PREMISES AT HONITON, DEVON.

Perth.—The memorial stone of the new church of Free St. Paul's, Perth, has just been laid. The new church is being erected on the site occupied by the old one, with a slight extension of frontage towards the north, and is designed in the Early Decorated Gothic style. Being situated between high buildings on each side, the side elevations, not being visible from the street, have been kept plain. In the front elevation the principal feature is the end gable of the church, with two four-light windows with cusped and panelled heads in the lower stage, and a large five-light window with traceried head and deeply-moulded jambs lighting the gallery. The gable flanks are enriched with panelling, and the apex has an arcading of cusped panels, with a central niche, over which a floriated cross forms the terminal feature. To the left of the main gable is a projecting stone porch, with wide moulded archway, forming the principal entrance, and to the right another doorway serves as exit from the gallery. The ladies' room and session room form an effective two-storey block to the left of the main entrance. Internally the church is divided into nave and side aisles by moulded columns and arches of wide span. The nave ceiling is semi-octagonal in form, divided into bays by arched timber ribs. Over the side aisles the main couples are also shown, and filled with ornamental timber cusping. The church is planned with side and end galleries, but the side galleries are narrow and recessed at the columns, which are thus shown unbroken from the floor to the ceiling arches. The total number of sittings will be 800, and the estimated cost is about £4,000. The architect is Mr. John B. Wilson, A.R.I.B.A., Glasgow, and the works are being carried out under his instructions by the following contractors: Mason, A. Beveridge; wright, William M'Quibban; slater, D. M'Lauchlan; plumber, James M'Leish; plasterer, John Peebles; glazier, C. Alexander—all of Perth. Mr. Thomas L. Kay is clerk of works.

A new Ward at the Oriolet Hospital, Loughton, has recently been added. The new ward is situate about 50yds from the main building, and has accommodation for four male and four female patients, besides an operating theatre and necessary offices.

The Bristol Police Courts are in need of extension. The City Council have provisionally decided to purchase a group of cottages known as Nelson Court for £5,000, to provide a site, and the sanction of the Local Government Board is to be asked. It has been suggested to advertise for plans and offer a premium, but nothing definite has yet been decided.

Harrogate Water Supply.—At the recent monthly meeting of the Harrogate Town Council the report of the Waterworks Committee was presented on the question of securing an additional water supply for Harrogate. In their report the Committee stated that the best available scheme was undoubtedly the one recommended by their waterworks engineer (Mr. E. W. Dixon) at the junction of the Agill and the Arnagill, to utilise the water from these streams, and construct a reservoir near their junction, on the estate of Lord Masham. The Corporation consequently resolved to instruct their engineer to prepare the necessary plans to be presented to Parliament for such a scheme.

Keystones.

A new Board School at Bideford is to be erected.

A Church at Goldenacre, Edinburgh, to be called St. Serf's, is shortly to be erected.

The Town and Winter Gardens, Cheltenham, are proposed to be altered at a cost of £3,500.

Eight Cottage Homes for about 130 Children are to be erected by the Newcastle Guardians at Ponteland.

A Home for Imbecile Children has been opened at Woodilee Asylum, Lenzie, Glasgow; it accommodates 33 children.

New District Council Buildings at Blaydon have just been opened. The buildings are in red brick, and have cost £4,000.

The Travelling Studentship of the Architectural Association of Ireland, value 10 guineas, has been won by Mr. Henry J. Lyons.

Several Houses and Shops in Dunbar are now being erected to the designs of Messrs. Swanston and Legge, architects, of Kirkcaldy.

A new Parish Church Hall at Lochwinnoch is being erected in connection with Lochwinnoch Parish Church. The architect is Mr. John M'Lelland, of Kilbirnie.

At St. Andrew's Church, Ashburton, a large tablet of polished brass, mounted on a slab of Ashburton marble, has just been added, to commemorate the reopening of the church after restoration and the placing in the tower of the clock and chimes.

A Sanatorium at Dundee for the treatment of consumptive patients is being erected on a site on Greenford Muir, at the foot of Auchterhouse Hill, 800ft. above the sea level, consisting of 21 acres of land, well sheltered from the north and east. The plans are by Mr. William Alexander, the city architect. The building will cost between £12,000 and £13,000.

Staple Inn, under the new London Government Act, will become a sanitary district in itself, but by arrangement the sanitary administration will be undertaken by the Clerkenwell Vestry. The property belongs to the Prudential Assurance Company, Limited, who spent a large sum on underpinning the houses and restoring the old façade when they acquired it, and they do not intend to destroy these historic relics.

Proposed Workmen's Lodging Houses at Kilmainham, Dublin.—A Local Government Board enquiry was held recently into the application of the Kilmainham Urban Council for a loan of £6,500 for the erection of working-class lodging-houses under the Housing of the Working Class Act. A site has been secured at St. John's Garden, held under lease for 999 years at a rent of £60 per annum. It is intended to erect three classes of dwellings—twelve first-class, eighteen second-class, and fourteen third-class buildings. The cost of each first-class house would be £152 16s. 11d.; the second, £137 14s. 1d.; and the third, £105 18s. It is proposed to let the first-class houses at a rental of 7s., second-class at 4s. 6d., and third-class at 2s. a week, which would leave a nett profit of £13 18s. 5d.

The Restoration of Clonfert Cathedral.—The rector of Clonfert appeals for help for this object. This cathedral, which is situated in the county of Galway, was founded in the year 558, and is a building of more than ordinary interest. It is very small, but has a doorway of such remarkable beauty that Mr. Ruskin, who was on principle opposed to all so-called processes of restoration, sent a contribution towards its preservation. During the last six years the work of repair has been going on, and a sum of £2,000 is now asked for. The secretary of the Society for the Protection of Ancient Buildings points out that the most costly portion of the proposed restoration scheme is the building of new transepts, the form of which must be purely conjectural. There is, he maintains, no need for such transepts, as the building is larger than necessary already, and in the Society's opinion the work already done is unfortunate.

A Carved Oak Font Cover in Esher Church has been erected.

The new All Saints' Church at Eastworth, Chertsey, is now being erected.

A new Roman Catholic Church at Enfield is being erected to seat 500 persons.

The Kildare Archæological Society held its annual excursion last week to Ballymore Eustace and district.

Mr. William Corden died last week at the age of 79. He painted a considerable number of pictures for Her Majesty the Queen.

The Fever Hospital at Plaistow is having a steam laundry added from the plans of Mr. E. T. Hall, 57 Moorgate Street, E.C.

The Ruskin Exhibition at Coniston closed on Saturday, after being open two months. The gross proceeds amounted to about £640. Of this a substantial balance remains towards the establishment of a permanent Ruskin Museum at Coniston. Early steps are to be taken towards the furtherance of that object.

A new Lunatic Asylum at Birmingham is to be erected by the Worcestershire County Council to accommodate 570 patients, with administrative buildings. Mr. G. T. Hine is the architect, who estimates the cost of the first buildings at £205,400, which when extended to hold 850 patients will be increased to £246,500.

Prizes for Architectural Drawings.—The Northern Architectural Association again offers to students (and Associates not in practice, nor yet twenty-five years of age) a first prize of books of the value of £2 2s., and a second prize of £1 1s., for the best set of drawings or testimonies of study, as required by the R.I.B.A. to be submitted for their final examination. Similar prizes will also be given for the probationary work for the intermediate examination. All particulars as to the R.I.B.A. requirements may be obtained from the hon. sec., or from the Institute Kalendar. The drawings are to be delivered to the hon. secretary not later than 11 a.m. on February 19th, 1901 (under motto).

Additions to the Tate Gallery.—Four of the nine large rooms recently added to the Tate Gallery have now been hung with paintings in oil and water-colours. The sculpture gallery has been filled with statuary. Among the most recent bequests by private owners are two fine marble statues presented by Mr. Henry Vaughan, one of Sir Joshua Reynolds by Foley, and the other of Flaxman by Mr. Henry Weeks; both of these have been placed in the vestibule of the building. Mr. G. F. Watts, R.A., has presented a bronze bust of Clytie, and Mr. Ralph Peacock his painting entitled "The Sisters." The National Gallery contributions include several works by Landseer, Wilkie, Etty, and a few—to remain there temporarily—by foreign artists, including examples of Scheffer, Dyckmanns, Giovanni Costa and Poussin.

New Books upon Architectural Subjects.—Mr. B. T. Batsford, of 94 High Holborn, W.C., announces for the autumn season the following new books and new editions:—"Old Cottages and Farm Houses in Kent and Sussex," by W. G. Davie and E. Guy Dawber. "Ornamental Details of Italian Renaissance," by G. A. T. Middleton and R. W. Carden. "Some Architectural Works of Inigo Jones," by H. Inigo Triggs and H. Tanner, junr. "Later Renaissance Architecture in England," by John Belcher and M. E. Macartney; complete in two volumes folio. "Flower Studies for the Use of Art Students and Designers," by Jeanie Foord. "New Tables for the Solution of Ganguillet and Kutter's Formula," by Colonel Moore, R.E. "Building Specifications for Architects, Surveyors and Builders," by John Leaning, F.S.I. "Building Construction (Elementary Course)," by Charles F. Mitchell. "A History of Architecture," by Professor Banister Fletcher and B. F. Fletcher; third edition. "Waterworks Distribution," by J. A. McPherson, A.M.I.C.E. "Sanitary Engineering," by Colonel Moore, R.E.; second edition. "Estimating," by George Stephenson; fourth edition. "Stresses and Thrusts," by G. A. T. Middleton; second edition.

A Public Library at Moreton, Hampstead, is being erected. The architect is Mr. Thomas B. Bowring, of 5 and 6 Billiter Avenue, E.C.

A new Borough Bandstand at Tunbridge Wells has been erected on "Ye Olde Pantyles." The structure is octagonal, 22ft. 6in. by 14ft. 6in. and 18ft. high to the apse of the roof. It is of polished oak, roofed with Brockly tiles. Mr. G. F. Featherstone was the architect, and Messrs. J. Mansfield and Sons were the builders.

A new Mission Hall at Bingley in connection with the Bingley Baptist Chapel, which has been erected to serve the needs of the Dubb district, was recently opened. The new building is of stone, erected from plans prepared by Mr. H. Foulds, of Bingley, and furnishes accommodation for about 200 children. Its cost has been about £420.

THE A.A. BROWN BOOK.

THIS well-known publication has just been issued for the session 1900-1901, price 2s. 6d. It contains the ordinary particulars of the Association and its work and the arrangements for the coming session, which begins on October 5th with the annual general meeting, when the President will deliver his address and distribute prizes. The report of the committee for the session 1899-1900 shows that the Association is in a flourishing position financially, socially, and educationally. The report states that there was a nett increase of sixty-one members during the past session, the total membership up to May 31st this year being 1,308: eighty-nine new members were elected, ten members rejoined, and the losses by death, resignation and other causes only amounted to forty-three. Nineteen committee meetings were held. The new common room has been well used by members and students, especially during the evenings, and the committee hopes that during the coming session its advantages will be still further appreciated. The question of obtaining a suitable site for new premises has occupied, we are told, the unremitting attention of the committee, but there is nothing definite to report. The sub-committee appointed last session for the purpose of compiling a list of buildings and monuments of interest in London and the provinces has been considerably augmented, and "Consuls" have been nominated for fifty-five London districts. These gentlemen are now engaged in the compilation of the lists so far as the metropolis is concerned, the provincial districts being deferred until progress has been made in London. The Register of Assistants has been even more largely used than before, and has again fully proved its usefulness both to architects and assistants; the registration fee to non-members has been increased to 2s. 6d. With regard to the educational work, the number of individual students shows a slight decrease, compared with the preceding session.

In the Discussion Section forty-seven members joined, and the average attendance was twenty-three. This enterprising and useful section of the Association has arranged to hold twelve meetings this session, as follows:—On October 12th Mr. Geoffry Lucas will read a paper on "Logical Building and its Influence on Design"; on November 2nd Mr. H. Rose will deal with "Church Bells"; on November 16th Mr. H. Munro Cautley will speak on "Suffolk Cottages"; on November 30th a debate will be held on a subject yet to be chosen; on December 14th Mr. H. V. Urawfurth Smith will deal with "The Churchyard and its Accessories"; on January 25th Mr. W. E. Davis on "The Management of House Property"; February 8th, Mr. G. R. C. Harding on "Professional Education in France"; February 22nd, Mr. J. Osborne Smith on "Domestic Heating, Ventilation and Lighting"; March 8th, Mr. H. P. G. Maule on "The Garden and the Architect"; March 22nd, Mr. S. L. Crosbie on "An English Cathedral"; May 3rd, Mr. E. Greenop on "The Ethics of Professional Advertising"; and on May 17th, Mr. P. E. Newton on "A Tour in Mid-France."

Ready this day.

Fifth Edition, revised throughout and greatly enlarged. Crown 8vo. cloth, price 3s. Sent post free for 2s. 6d.

BUILDING CONSTRUCTION & DRAWING

(First Stage or Elementary Course).

A Text Book on the Principles and Practice of Construction. Specially compiled to assist Students in preparing for the various Examinations, &c.

By CHARLES F. MITCHELL, Lecturer on Building Construction to the Regent Street Polytechnic, London.

Containing 360 pages, with nearly 950 Illustrations, fully dimensioned, many being full-page diagrams.

This New Edition contains over 50 pages of additional matter and 250 more Illustrations, whilst practically the whole of the Illustrations retained from the previous Edition have been redrawn.

Recently Published. Second Edition, revised and much enlarged. Crown 8vo, cloth, price 5s. 6d. Sent post free for 4s. 6d.

BUILDING CONSTRUCTION.

Advanced and Honours Courses.

By CHARLES F. MITCHELL.

Containing 550 pages, with upwards of 350 Illustrations, fully dimensioned.

"Mr. Mitchell's two books form unquestionably the best guide which any student can obtain at the present moment. In fact, so far as it is possible for anyone to compile a satisfactory treatise on building construction, Mr. Mitchell has performed the task as well as it can be performed."—*The Builder.*

B. T. BATSFORD, 94 HIGH HOLBORN, LONDON.

CITY OF LIVERPOOL.

SCHOOL OF ARCHITECTURE AND APPLIED ART,

UNIVERSITY COLLEGE.

The SEVENTH SESSION, 1900-1901, COMMENCES MONDAY, OCTOBER 1ST.

In Architecture a two years' course of preliminary training is provided for students to pass through before entering an architect's office. Classes are also held in the Day and Evening for elementary and advanced students.

Classes are held in Modelling and Designing ornament and the figure suitable for sculptors, modellers, carvers, plasterers, &c.; in Drawing, Painting, and Decorative Design, the last being specially arranged for students who wish to take up decorative work; in Wood Carving and Wrought Iron; in Brass and Copper; in Stained Glass and Enamelling; in Furniture and Fittings Construction and Design.

Six Free Studentships are offered to the Day Classes and Crafts Studentships for students before entering their apprenticeship. Fourteen Free Studentships are offered to the Evening Classes.

Prizes are awarded at the end of the session.

For details of classes, free studentships, prizes, and all further particulars apply to the Director.

Professor SIMPSON, University College.

FLEMING'S "TEON" BELT.

THE BEST & STRONGEST BELT FOR DRIVING IN HEAT, STEAM, DAMP, WATER OR OUT OF DOORS.

A Contractor writes:—"I shall be glad to recommend it as superior to any other Belting I have in use."

FLEMING, BIRKBY & GOODALL, Ltd., Wegrove Mills, HALIFAX, Yorks.

WORSHIPFUL COMPANY OF CARPENTERS.

LECTURES ON SANITARY BUILDING CONSTRUCTION

In connection with an Examination to be held at Carpenters' Hall on NOVEMBER 15th and 17th will be delivered as follows:—

DATE, 1900.	LECTURER.	SUBJECT AND SYNOPSIS.
Thursdays, October 4th	KEITH DOWNES YOUNG, ESQ., F.R.I.B.A.	**Building in its Relation to Health.** Soils, Foundations. The prevention of all that would prove detrimental to Health. Materials; Structure; Planning, &c.
October 11th	A. WYNTER BLYTH, ESQ., Barrister-at-Law, Medical Officer of Health for St. Marylebone.	**Sanitary Appliances.** The Advantages and Disadvantages of various Sanitary Appliances used in Buildings. Principles of Ventilating and Warming Buildings.
October 18th	A. BUCHANAN, ESQ., Instructor in Building Construction at University College, London, and Battersea Polytechnic.	**Plumbers' Work connected with Dwelling-Houses.** Methods of making Lead Soil Pipes, Bends, Traps and various Joints. Connections to W.C.'s, Baths, Sinks, Lavatories, Iron and Stoneware Drains. Ventilation of Soil Pipes and Drains, Flushing and Antisyphonage. Water Supply, Service Pipe, Cisterns and Connections.
October 25th	PROF. R. ELSEY SMITH, A.R.I.B.A., Professor of Architecture, King's College, London.	**The Drainage of a Dwelling-House.**
November 1st	JAMES BARTLETT, ESQ., M.S.A., Lecturer, King's College, London.	**Setting Out Work and Bye-Laws.** Principles of Calculating Areas, Cubic space; Interpretation of Drawings to scale; Methods of Setting out Work, Checking Levels. Knowledge of the Acts of Parliament relating to Buildings. The Model Bye-Laws issued by the Local Government Board, so far as they relate to the subjects of the Examination.

These Lectures are primarily intended for Candidates for the present or future Examinations, and are Illustrated by Take-to-pieces Models, large Diagrams, Photographs, and Specimens of Materials.

Lectures commence at 7.30 p.m.

Entry Forms for the Examination, Tickets for the Lectures, and all particulars can be had from

S. W. PRESTON, ESQ.,
Carpenters' Hall, London Wall.

Property and Land Sales.

October 4th.—Wallington, Surrey.—Freehold Building Plots. Liberal frontages and depths. Eight minutes from Wallington Station, 35 from London Bridge, 40 from Victoria, 20 from Crystal Palace, 7 from Croydon, and 4 from Sutton.

60 CHOICE FREEHOLD BUILDING PLOTS, including eight valuable shop plots, adjoining Wallington Station, will be SOLD by AUCTION on THURSDAY, October 4th, at Six o'clock precisely, at the GREYHOUND HOTEL, West Croydon. These plots form a portion of the Little Woodcote Estate, Wallington, Surrey, charmingly situated, and close to Wallington, Station, and fronting Park Hill Road, Stanley Park Road, and Heathdene Road. The plots occupy an elevated position, command beautiful views, and afford excellent sites for medium-sized villas, which are much needed in the neighbourhood. Free of tithe and land tax. Free conveyances. Purchase money payable over nine years. Particulars, with plan and conditions of sale, may be had from Messrs. Gedge, Kirby, and Millett, Solicitors, 11 Great George Street, S.W.; the Imperial Property Investment Company, Limited, 27 and 28 Basinghall Street, E.C.; and Messrs. Fuller, Moon and Fuller, Auctioneers, 83 High Street, Croydon, and the Estate Office, Wallington, Surrey.

SHEPHERD'S BUSH.—Contractor's Plant and Materials used in the construction of the Central London Railway.

MESSRS. HORNE and CO. are instructed by the Electric Traction Company, Limited, to SELL by AUCTION, in Lots, on the premises, Woodhouse Park, Wood Lane, Shepherd's Bush, on WEDNESDAY, SEPTEMBER 26th, at TWELVE o'clock precisely, the CONTRACTOR'S PLANT and MATERIALS, including four 10 h.-p. portable engines by G. Marshall, Sons and Co., a 3-ton travelling steam crane by G. Smith, set of new 10-ton lifting tackle, vertical boiler by J. Slee and Co., five friction hoists, two circular saw benches, six mortar mills (five 9ft. and one 7ft.), four single and double purchase crabs, three portable forges (27½-yard and 4¾-yard) w.i. skips, bolts, nuts, wrought and cast scrap iron, tar boilers, light rails, 50 tarpaulins, several hundred loads of deals, boards, die squares, and baulk timber, 5,000 scaffold boards, 1,500 putlogs, 2,000 poles, 120 dozen scaffold cords, rope falls, contractor's offices, tool and watchmen's boxes, erection of workshops, temporary sleepers, barrows, ladders, trestles, galvanised iron cisterns, and a large quantity of miscellaneous and useful material.—Catalogues obtainable (when ready) on the Premises, and of Messrs. HORNE and CO., No. 85 Gresham Street, E.C., and 8 Delahay Street, S.W.

ISLINGTON, Upper Street.—Valuable FREEHOLD BUILDING LAND in rear of Nos. 147 to 152 Upper Street, having an area of about 8,000ft. super, suitable for the erection of a factory or workshops, having passage way approach under No. 151 Upper Street. Possession on completion of purchase.

MESSRS. HARMAN BROS. will SELL the above by AUCTION, at the MART, Tokenhouse Yard, E.C., on TUESDAY, SEPTEMBER 25th, at TWO o'clock precisely. Plan and particulars may be had of Messrs. HARMAN & CHALCRAFT, Solicitors, 17 Coleman Street, E.C.; and of the Auctioneers, No 25 Ironmonger Lane, Cheapside, E.C.

Third Portion.—WEMBLEY-HILL ESTATE, opposite the Site of the New Station on the Great Central Railway.—83 Plots of Freehold Building Land, on one of the boldest heights near London, renowned for its health-giving characteristics, commanding grand views over most charming landscapes, and surrounded by a thriving and rapidly-increasing neighbourhood; the Estate is most advantageously located on the gently rising slope of a lovely hill, with frontages to Wembley Hill, and traversed by fine, well-made roads leading therefrom; the plots offer admirable sites for the erection of villa residences and shops, for which there is an ever-increasing demand; the attractions of the neighbourhood include Wembley Park and the splendid golf links, whilst excellent services of trains from Sudbury and Wembley Park Stations afford means of rapid access to City and West End; water, gas, and excellent sewer mains; free conveyances; no land tax or tithes; purchase-money payable by instalments if desired.

MR. WALTER HALL will SELL the above by AUCTION, at the Willesden Junction Hotel, on Monday Evening, October 8th, at Seven o'clock.—Meanwhile plans and further particulars may be had from Messrs. Woodbridge and Sons, Solicitors, 7 New Square, Lincoln's Inn, and Uxbridge; and of the Auctioneer, 38 Chancery Lane.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., 115 Gower Street, W.C. (close to the British Museum).

MODELS.
For Exhibitions or Law Cases.
Illustrations sent of Work Executed.
JOHN B. THORP, 98 Gray's Inn Road, W.C.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly prepares Candidates for the above Examinations by correspondence. No books required.—For particulars and testimonials, apply CERTIFIED COACH, "Malabar," New Eltham, S.E.

TYPEWRITING OFFICES, Camomile Street Chambers, London, E.C.—Specification, ten typewritten fcp. pages (about 3,000 words), six permanent ink copies (not carbons), 20s. Send MSS. specimen order. Reporting Lectures, Meetings, &c., 10s. 6d.

ARCHITECTS AND SURVEYORS.—QUANTITIES PREPARED, VARIATIONS ADJUSTED, &c., by experienced Surveyor. Terms by the hour or commission.—"H. R. A.," 22 Ellison Road, Streatham Common, S.W.

ISOLATION HOSPITALS.—Expert Confidential ASSISTANCE rendered. Formerly draughtsman L.G. Board. Highly successful in competitions. Moderate speculative terms.—"G. B.," 90 Monkton Street, Ryde, I.W.

TO ARCHITECTS, UPHOLSTERERS.—PAINTING and DECORATION WANTED. Contract or day-work. Estimates free.—CHAS. STOLLE, 33 Blenheim Crescent, Notting Hill.

QUANTITY SURVEYOR would be glad to prepare Bills of Quantities for Architects or others in spare time. Moderate terms.—Box 1,475, BUILDERS' JOURNAL Office.

APPOINTMENTS VACANT.

ARTICLED PUPIL REQUIRED by a firm of Architects and Surveyors. Principals undertake tuition.—MIDDLETON & CARDEN, Associates R.I.B.A., 19 Craven Street, Strand, W.C.

APPRENTICE WANTED, to learn the Plumbing and Gas Fitting.—Apply Jacob's Well Passage, 20A, Barbican, E.C.

CARPENTER WANTED to erect Factory Roofs.—Apply London Scottish Iron Company, Barking.

CASEMENT HANDS (First-class) WANTED. Apply WHITE AND SONS, Marlboro' Mews, Oxford Street, W.

NORTH OF ENGLAND.—WANTED, an experienced and artistic DRAUGHTSMAN for pure design and charge of drawing office. No quantities, &c.—Apply for particulars, and state nature and length of experience, to P., 57 John Street, Sunderland.

PAINTER.—LAD WANTED to assist in paint shop and make himself generally useful; must have had some previous experience.—Apply before 11 a.m., Works, 32 Commercial Road, Lambeth; near Old Shot Tower, Waterloo Bridge.

BUILDER'S CLERK WANTED for small country office. Must have had experience and used to prime cost.—Apply to NICHOLS BROTHERS, Oakham.

JUNIOR CLERK, Builder's Office. Good writer; square dimensions and neat tracer. State wages.—PATMAN AND FOTHERINGHAM, LIMITED, Park Street, Islington, N.

APPOINTMENTS WANTED.

AN EXPERIENCED YOUNG MAN aged 24 requires SITUATION as Clerk and Bookkeeper. Highest references.—W. F. P., 30 Corrinne Road, Tufnell Park, N.

ADVERTISER WANTS SITUATION as CLERK OF WORKS, estate or building; 16 years' practical experience; first-class building construction and other certificates; good draughtsman; well up in figures, estimating, &c.—CASWELL, Stratton-on-the-Fosse, Bath.

CARPENTER and JOINER.—Good all-round hand, or would take alterations and repairs; labour only.—R. HAY, No. 1 Block, Burdett Buildings, Westminster Bridge Road, S.E.

BRICKLAYER (Experienced); also good pointer; day or piece.—"J.," 21 Allanmouth Road, Hackney Wick, N.E.

BRICKLAYER.—Practical jobbing builder's work; could take charge.—7 Avon Place, Borough High Street, S.E.

BRICKLAYER (Jobbing) wants Job; well up in sanitary work.—"W. H.," 10 Northampton Street, St. John Street Road.

CARPENTER, JOINER or WORKING FOREMAN, well up in all branches of building trade, alterations and repairs.—"P. W.," 51 Chester Road, Bounces Road, Lower Edmonton.

SHOP FOREMAN of JOINERS DISENGAGED. Thoroughly practical in all joinery work. Excellent setter-out. Energetic and reliable. Used to machinery. Good reference. Aged 33 years.—"X. Y.," 57 Beaconsfield Road, South Tottenham, N.

BUSINESSES WANTED & FOR SALE.

Slater.—Jeffrey & Co....	24	

New Goods Station for Devonport.—Excellent progress is being made with the new goods station that is being built in Valletort Road, Stoke, for the Great Western Railway Company, by A. N. Cole, of Plymouth, whose contract amounts to £27,000. The work was commenced in June last. There will be two entrances to the station, the main one being in Valletort Road, and a second at the end of Fitzroy Terrace. The main building will consist of a shed 123ft. long; the office, 31ft.; and a lock-up room, 20ft. 6in. At the end of this block there will be provided a platform 160ft. in length. The station will be connected with the main line by a roadway underneath Portland Road. This piece of ground will be cut through, and an iron bridge with brick arches will span the road. The work has to be completed in eighteen months from June last.

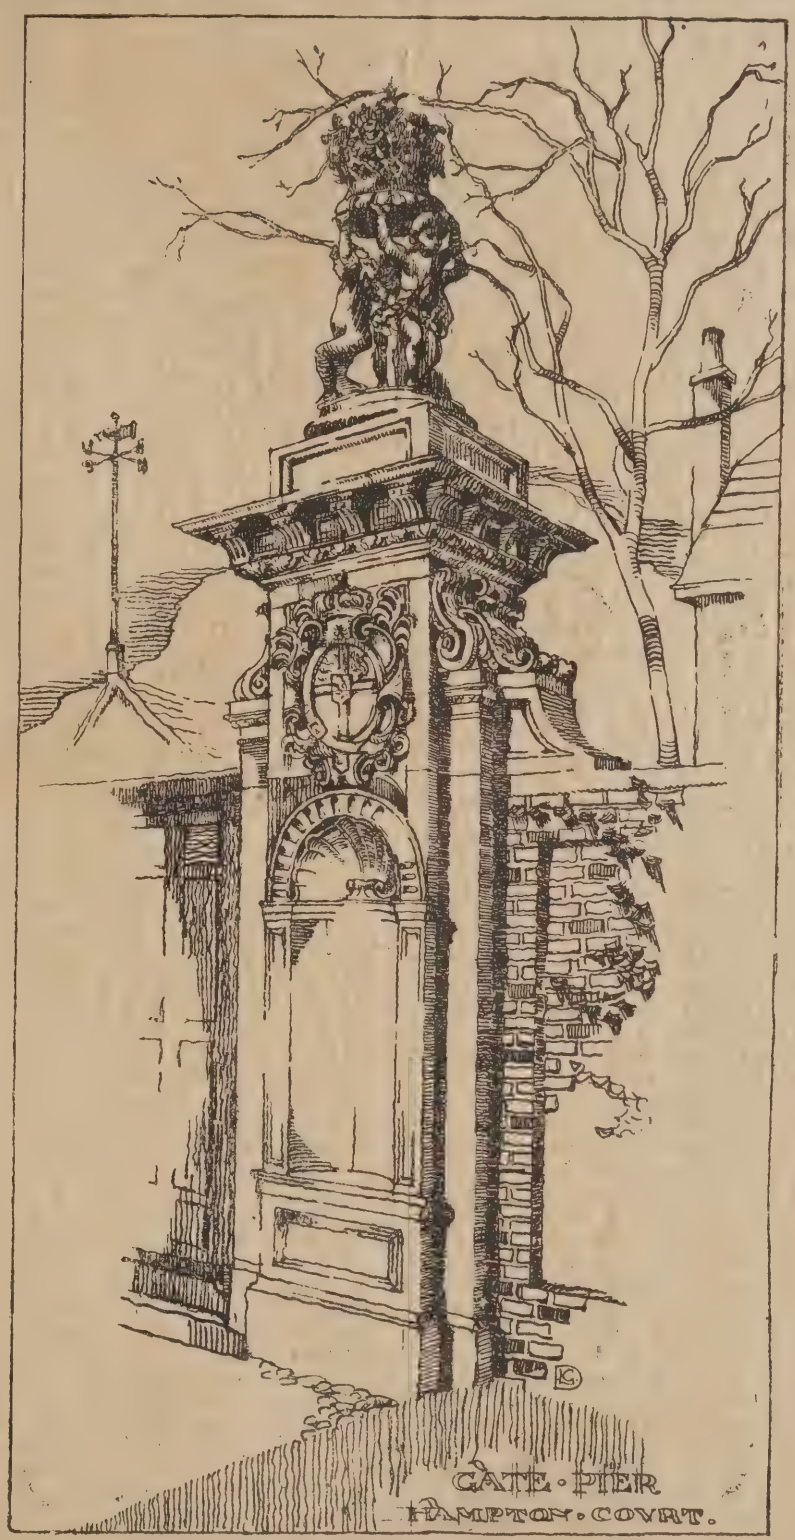
An Architectural Causerie.

Photography and Architecture.

THE most enjoyment to be gained from the new exhibition of the Photographic Salon at the Dudley Gallery, Egyptian Hall, is in the contemplation of the frames, mountings and marginal arrangements, which show decided taste, and are themselves objects of genuine delight—all show the influence being exerted by the Arts and Crafts movement. The effects produced by the camera, as witnessed in the photographs on view, are at the same time both wonderful and wrong. No one can deny the skill that is evident in some of the "pictures" (many of them "impressionistic" carbon prints), but nevertheless it is a kind of affectation, which is sure to be the case when "effect" is sought after. The real sphere of photography in connection with architecture and archæology does not lie in that of the fine arts, because, first and foremost, it is for *absolute record*. It is not the place of the camera to take pleasing effects of masses of stone, however skilfully the negatives are touched up and printed: we should be content to let this remain in the hands of the water-colourist. Out of all the photographs produced none come near to any of Turner's architectural colour sketches. But for recording evidence of curious carvings, particular mouldings, angles, joinings, portions of arcades, capitals and fragments generally, that is where the true value of the camera comes in. No doubt the present exhibition makes a decidedly pretty show (though only two of the prints can be called architectural, which shows that not too much thought is given in this direction), but as an exhibition of any permanency it is worthless.

Particular places on the earth are of course bound to be attractive to individual minds owing to some incidental occurrence, which means nothing to the uninterested. But real architectural photographs are worthy of the attention of all educated and artistic persons, whether professional architects or not. And, further, the individual architect, with a camera at a cathedral, can take whatever strikes his fancy (which will naturally at the same time interest his brother architects), items which the professional photographer never thinks of dealing with (nor can he be expected to do so), but goes on year after year taking comprehensive views of the whole building, the west front, &c., which are of less value to an architect, and have been engraved (far more excellently) years ago in such works as Britton's and Winkle's "Cathedrals."



As before stated, great taste is displayed in the setting of the photographs at the exhibition which has suggested the above remarks, some having the mount and glass bound at their edges with a thin strip of paper, without any frame. But I cannot do otherwise in concluding than repeat the maxim, which should be taken seriously to heart, that photography, at least in its relation to architecture, is not a fine art, but a record. M. J.

Gate Pier, Hampton Court.

THE Gate Pier illustrated on this page forms one of the pair at the northernmost end of the Great Terrace at Hampton Court, opposite Wren's garden front, and was designed by him, with the rest of the work. The gates are known as the Flower-Pot Gates, and the stonework is remarkably well preserved, the sculpture retaining all its original sharpness.

A Church Legend of North Devon.

THERE can be no doubt that the townsfolk of Barum were much put about on hearing the latest news concerning the new church in process of erection in the valley of the Yeo. Rumour said that no sooner had the walls risen three or four feet from the foundations than they were thrown down and flung into the River Yeo overnight. It was causing a great deal of excitement in the town: the narrow streets were crowded; groups of men and women stood at the corners and in the roadways excitedly discussing the turn of events. "They do say," said one of a knot of men gathered near the Guildhall, "that the Devil has been seen about these parts of late." "Od rot you, friend," said another of a cheerful countenance; "dost still hold to the old notions in these parts?" "Ay! that we do, Master Stubbs; you fat folk of the big town up along are too quick to hold with newfangled notions. If you concerned yourself less with the foreign ideas coming into these parts the Devil might not be so fond of visiting the West Country." "Ha! ha!" laughed Master Stubbs, "it would seem as if the Devil was over-fond of you Barum folk, and yet methinks he shows his affection in a strange and curious manner. He has twisted your leaden spire, and made the neighbouring folk of Brauntane build their church in the valley; and now, alas! for you, my friends, he has been paying a visit to your new church on the banks of the River Yeo." "Come! come!" said another who had not yet spoken: "Don't quarrel; fat Master Stubbs will have his gibe, and means

DRAWN BY L. G. DETMAR.

no offence. Whether it be the Devil or some apprentices on the spree, the matter must be looked into, and that quickly. The building must be watched day and night, and a body of the town archers should be sent down to defend the walls if the work is to go on." During the same day and the one following the authorities were busy: they sent carpenters, sappers and diggers down to the river bank, and by the evening of the next day there was a strong but roughly-made stockade at the water's edge opposite the church, the river forming an additional security for the town archers against the sacrilegious ruffians bent on harassing the builders of the church. Late in the evening the bowmen took up their position behind the wooden barrier, and Master Stubbs, with several of the citizens armed with the parish church flintlocks, flanked them right and left. A small cannon was placed to cover the east end of the church walls, the Mayor for the time being holding the position of gunner to the town of Barum. The darkness deepened; some men standing about, and others sitting quietly, prepared for the worst. For a long while nothing could be heard but the chirp, chirp of the cricket in the long grasses, and the swish, swish of the rushing water as it played about the overhanging bushes that fringed the bank. Three times during the evening the town clock clanged out the hours. It was now near midnight, and the archers were beginning to get impatient, to grumble and to murmur among themselves: "What wild-goose chase is this that we are out on?" "By our Lady!" quoth fat Stubbs, with a chuckle; "I'm thinking the Devil hath no stomach for our town cannon." "Tut, tut, fat man," said the Mayor, "thy humour is ill advised; this is no time for jest; be it fiend or man, we must be ready. Hist! friend, see yonder on Pylton Hill; what do you make of it?" "Pish, Mr. Mayor, you are too easily aroused; that is only the lantern of some belated country traveller." The next ten minutes passed very quietly: numbers of other lights now appeared flitting to and fro. "Now, Master Stubbs," whispered the Mayor, "think you still that they are lanterns? If I am not much mistaken there is going to be some hot work." Suddenly, a loud clap startled the watchers, and then almost directly the walls of the church stood out clearly thronged with many figures, flashes coming and going from the bright beings across the river. The archers, at first dazzled, were presently sending showers of arrows on the walls, but the bright figures danced on, catching the arrows and throwing the stones from the walls as they went. Nothing seemed to disturb the Devil and his imps, but the Mayor was not to be discouraged, and determined to carry on the fight to the end. Amid the noise of the flintlocks, the whistle of the arrow in flight and the twang of the bowstring, the Mayor was coolly aiming and loading his cannon. Carefully shifting it into position he lighted the fuse; a moment, and then the cannon roared, half the lights disappearing from the eastern wall. Two or three minutes went, and another roar burst and echoed round the valley, and then all was dark. "'Ods, bobs," came the unmistakable voice of fat Stubbs from out of the night. "The Devil is dead this time; but, by my halidome! never shall I be doubting again that the Devil roams the country as of old. Light the lanterns, men, the other lights are out, and there will be no more disturbance for some time to come; the building of the church can go on in the morning." Strange to say, the people of Barum, with characteristic obstinacy and contrariness, determined to erect the church on the Pylton Hill as a beacon to the weary traveller, that he might know that in the hollow beyond lies the chief town of North Devon, full of good men and true.

On Reflection.

Architects' Assistants' Salaries.

WITH this issue we bring to a close the correspondence which has been going on in our columns for the past eleven weeks with reference to the salaries of architects' assistants: the present is therefore an opportune moment to express our own opinion on this subject. Of three things there can be no doubt, namely, (1) that there are a number of competent assistants who do *not* receive a fair salary for the work they do; (2) that it is very difficult to get a capable assistant; and (3) that the profession is full of young men who have not the qualities which go to make a good architect, and who have been articled through the well-meant efforts of misguided and misinformed parents. It is often the case that the premiums paid by pupils form a goodly part of an architect's income, and that the pupils in return are allowed to pick up in their own way what architectural knowledge they can, being looked after by an underpaid head assistant, who is *really* the author of all the work produced by the office—in fact, he acts in the dual capacity of manager and ghost to his principal. We do not wish to cast aspersions on practising architects, but it is certain that many of them do not pay a sufficient salary to the assistants on whom they are so greatly dependent. On the other hand, the ordinary assistant is far from being perfect. He does not seek to improve himself as he should by close study, diligent practice, and intelligent observation, but often wastes his time in a way which is both contemptible and exasperating; and such stupid negligence is hardly calculated to produce an architect who can design a building that is worth looking at. It is largely due to this fact of the profession being crowded with incompetent assistants that we hear so much of insufficient salaries; and it is true that young men of this calibre lower the status of assistants as a whole, bringing discredit and inadequate salaries to the men who, by natural aptitude and praiseworthy study, have made themselves competent. But in the majority of cases the parents are largely to blame, and they should therefore be included in the indictment. To adopt an old maxim, architects are born, not made, and it is a pure waste of time and money for parents to article their sons to architects just because they have a taste for drawing, as it is called. An architect needs to be more than a draughtsman, a platitude which fathers and mothers and guardians still fail to grasp; if they only did, what a weight might be removed from the profession, and what excellent additions might be made to the Army, the Navy, stock-broking, cattle farming, or, perhaps, to the drapery warehouse business!

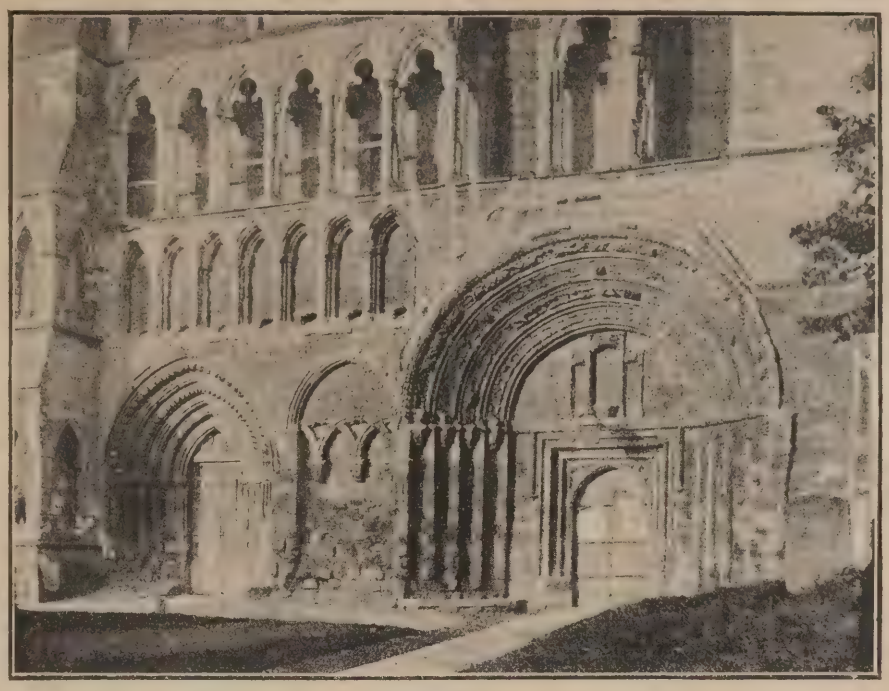
Suggested Remedies.

HAVING set forth the condition of things, the suggested remedies have next to be considered. There is merit and demerit in the idea of establishing a central body, with branches all over the country, for controlling the minimum salaries paid to assistants, in the same manner as the Institute schedule fixes the fees chargeable by an architect. Details for such a scheme have already been published in our columns. Its merit lies in the guarantee, practically, that the assistant will receive a salary justly proportionate to his ability; its demerit is that many assistants newly-released from their articles will be paid more than they are worth. But in working out the scheme the methods adopted for the professions should be followed rather than those for the trades, in which conditions are different. The suggested remedy that assistants should throw up their positions and become working builders, though based on the principle in vogue when the beautiful mediæval buildings were erected, would necessitate too drastic a change to be practicable nowadays; it contains, however, a germ of real worth, that which is directed against the current prevalent practice of grovelling copyism and the employment of misunderstood forms. Other remedies have been suggested in a rather meagre manner, such as the formation of a new Institute, but these are less feasible, and they are not for us to carry into practical effect. All we can do is, firstly, to urge parents and guardians not to article their charges to architects unless they possess *considerable* natural talent for the profession; secondly, to urge architects to pay their assistants what they really know they are worth, not to get them "on the cheap"; and, thirdly, to urge the assistants to do all they can to improve themselves in design, in constructional knowledge, and in business ability. If all concerned would only act according to these principles the trouble would be at an end; we can but state the case and let who will apply the practical remedy.

London University and Architecture.

THE failure of the University of London to recognise the claims of Architecture has again been brought under notice by a letter in the "Times" newspaper from Mr. William Emerson, President of the Royal Institute of British Architects. He points out that when the Cowper Commission was appointed in 1892 (it was a Royal Commission and derived its name from the fact that the chairman was Earl Cowper) the Institute obtained permission to attend and give evidence of its efforts for improving the education of the architectural student. In the report of the Commission it was recommended that the Institute should nominate one member of the new Senate, and that Architecture should be recognised as one of the branches in the Faculty of Applied Science. "If these recommendations had been adhered to," says Mr. Emerson, "official recognition of Architecture and of the Royal Institute as one of the agencies 'concerned with the intellectual life of London' would have been of great public value, but, unfortunately, in the Act of 1898 this was entirely ignored, and no mention of Architecture or of the Institute occurs in the 'statutes' for the University. The council of the Royal Institute of British Architects endeavoured to induce the University Commissioners to meet a deputation to discuss the matter, but without success." It should be mentioned that during the hearing of the evidence by the Commission it was admitted that the artist would profit by a knowledge of scientific and æsthetic laws, but the predominant importance of execution, mastery and spontaneous imaginative power was insisted upon; there was no sympathy for establishing a distinct position of Art for Art's sake. There are eight faculties of the University, namely, theology, arts (this means the Liberal Arts, not the Fine Arts), laws, music, medicine, science, engineering, economics and political science; and it is very much to be regretted that a Faculty of Architecture is not also included. Candidates for Oxford and Cambridge degrees have to pay certain fees, pass certain examinations, be males, and reside within the precincts of the Universities for a prescribed time; but only the two first conditions need be complied with for a London degree. Unfortunately, there seems little hope at present of a Faculty of Architecture being established, though it certainly deserves such recognition, especially when one sees what has been done by the Victoria University in this country and by nearly all similar institutions in the United States.

DUNSTABLE AND ITS NEIGHBOURHOOD.



By WORTHINGTON G. SMITH, F.L.S.

THE town of Dunstable is eleven miles north of St. Albans and thirty-three miles from London. It is situated on the Great North Road—formerly a Roman and British road—and is crossed in the middle of the town by another Brito-Roman road called the Icknield Way. The Great North Road was the Via Vitellina of the Romans, the Icknield Way the Via Iceniana.

Dunstable is enclosed by hills on the east and west, and on these many Celtic tumuli and earthworks are situated. Stone implements, like celts and arrow-heads, are found all over the district, and Roman relics, such as cinerary and other urns and coins, are constantly being unearthed.

Dunstable was the Celtic position of Dorcomriv, the Durocobrivis of the Roman Itinerary, and in Roman times a temple dedicated to Mars stood in the neighbourhood. Traditions obviously as old as Roman times are still heard in some of the villages round the town, and some positions (Campum-dunum, for instance) still retain Roman names.

At the time of the Conqueror the site of the present town of Dunstable was a waste. The Saxon houses of wood had all been burned, and the people murdered by the Danes; consequently the name does not occur in Domesday. In Norman times, according to contemporary documents, the place was infested with robbers, who preyed upon the wayfarers using the roads which crossed where the town now stands. To improve this state of things Henry the First founded a church and monastery of Augustinian canons close to the cross-roads, and built a palace for himself on the north side of the church. A farmhouse with massive stone foundations, called Kingsbury, now occupies the site of the king's demolished house. Very little of the Priory remains: there is not a stone above ground of the presbytery, choir, central tower, transepts or Lady Chapel. The Norman nave is, however, fairly intact, but both aisles and east end are almost entirely modern. The south aisle is mainly a modern restoration of Norman work, the north a restoration of Perpendicular. The restorations were fairly well done by the late Mr. George Somers Clarke, who, however, introduced a beautiful but incongruous pulpit of marble, Italian Gothic in style, and quite foreign to the rest of the architecture of the church. In 1891 Messrs. Bodley and Gardner erected a new east end, built over a stone screen which formed the entrance to the former choir. The wall is painted and gilt in a florid manner with a Crucifixion, with St. Mary, St. John and other saints, in strong contrast to the beautiful massive Norman work which it abuts. The old clerestory of the church has long vanished, and the triforium, now filled with restored Perpendicular fillings, forms a kind of clerestory. The date of the interior Norman work is about 1150.

DUNSTABLE PRIORY CHURCH: THE WEST FRONT.

DUNSTABLE PRIORY CHURCH: SOUTH SIDE OF NAVE.

The accompanying illustrations show parts of this noble church. The Perpendicular work in the west front belongs to about 1400 or 1450, the Early English from 1270 to 1300. The magnificent semi-circular Transitional arch dates from 1180 to 1200. Some parts, as the interlaced arches between the Norman and Early English doors, closely resemble work at St. Albans.

In the High Street, at a house still called the "Priory," there exists an Early English substructure dating from about 1300. This is part of the old Guest House or Hospitium of the Priory. It is now transformed into three apartments divided by wooden partitions, and forms a large hall and two living rooms. The grand old stonework is painted and varnished to represent a country decorator's idea of oak! A great deal of the stonework of the demolished parts of the Church and Priory exists in the neighbourhood of the town, having been built into houses, barns, walls and foundations. The majority of the brasses have gone, and modern tiles have taken their places. A knight's helmet which once existed in the church has disappeared; the whole accoutrements of a thirteenth-century knight (belonging to the church) were once in private possession in the town. Nothing of the kind is here now. The carved stalls which once existed have all vanished. A former rector destroyed the holy-water stoup. At the time of Mr. Clarke's restoration the old pulpit was sold by auction, and was at length acquired by a publican for a tea garden; other objects were robbed from the church at the same time. A very old hour-glass, with some ancient floor tiles, then disappeared.

The font is new—in the "Norman style"; the old Norman font was thrown away.

Things are changing very rapidly at Dunstable, and the good old houses are vanishing, being replaced by structures like those in the minor suburbs of London.

One of the accompanying illustrations shows four old passages in the town, but since the drawing was made the fourth has been burned twice, and its appearance has consequently been changed.

Richly-carved stones occur in gardens in the town, and portions of the missing columns of the great portal help to adorn some "rock-work." A vast number of the carved stones belonging to the choir were dug out some years ago and carted to the western downs, where they were buried in a large hole south-east of the five Celtic tumuli. A stone coffin was used as a horse-trough and then broken up for road metal. A life-size figure in stone of St. Frehemund also vanished.

The inscribed Sanctus bell is preserved on the side of the Town Hall; it is now a fire bell.

The ancient church at Kensworth, two doorways of which are here illustrated, is one mile to the south of Dunstable. There may be Saxon work in the church where the rough-cast is placed on the north side; at any rate, the illustrations show that early Norman work is to be seen there. The south door is now protected by a modern porch, but a much better wooden porch existed formerly. One capital has a figure subject, the other has interlaced work similar to that on Celtic crosses. The nave door, like the south door, is structurally external, and has been protected by a Perpendicular tower, now covered with rough-cast. The carving on the arch and capitals is remarkable, though at some period it was tooled up and renovated. It has been stated that this was done by a cleric who was an amateur carver. On an impost near this door a grotesque bird, of the date of the old Norman work, is carved.

In some labourers' cottages close to the church some massive stonework is to be seen. This is traditionally said to be part of a former residence of King John. The old form of the village name is Kings-worth; it occurs in Domesday as Kene's-worth. A few years ago zig-zag work from a Norman arch was taken from a stone wall of a farm close to the church. Norman windows occur on the north side and a stone staircase to a demolished rood gallery still exists.

SOUTH DOOR, CHURCH OF ST. MARY, KENSWORTH, NEAR DUNSTABLE. DRAWN BY WORTHINGTON G. SMITH.

WEST DOOR, CHURCH OF ST. MARY, KENSWORTH, NEAR DUNSTABLE. DRAWN BY WORTHINGTON G. SMITH.

RUSKIN UNION CONGRESS.

THE first congress of the Ruskin Union, which was formed early this year for the purpose of promoting the study of the works of John Ruskin, was opened in Sheffield on Friday last. About fifty delegates from London and the large provincial towns were welcomed in the Town Hall. In a brief address the Lord Mayor dwelt on the relationship between Ruskin and Sheffield, which induced him to present to the city the magnificent museum of which they were so justly proud. The reasons Mr. Ruskin gave when he selected Sheffield to deposit his treasure were four. He acknowledged, first, that ironwork was an art necessary and useful to man; secondly, he acknowledged that in cutlery ironwork, which of course included steelwork, they had in Sheffield the best of its kind. The next reason was that Sheffield was situated in Yorkshire, and Ruskin paid the county the compliment of believing it to be in the main old English, and capable yet of the ideas of honesty and piety by which old England lived. Finally, he chose Sheffield as being within reach of beautiful natural scenery, and the best art of English hands at Lincoln, York, Durham, Selby, Fountains, Bolton and Furness.

At the close of the mayoral reception the delegates inspected the Ruskin Museum, where the collection was described by Mr. Parker, the curator. In the evening a reception at the Town Hall by the Lord and Lady Mayoress was attended by 500 guests.

In the course of his presidential address, delivered on Saturday, Lord Windsor said he did not think Ruskin was infallible, either as an art critic or as a teacher of practical political and social economy. Ruskin's voice was first heard among us when art, in the main, had withered under the cold conventionalities and narrow rules of pseudo-classical school teaching. There were exceptions, no doubt, but Ruskin saw that if any new life was to be infused into artistic work in this country our artists and craftsmen must go to a totally new source of inspiration, that the true source was Nature itself, and that upon a reverent study of Nature alone could real artistic work be produced. He looked to Ruskin as the "seer" and the prophet, who, with deeper vision than most men, taught us the everlastingly true principles of art, rather than to his own application of these principles, which are apt to be enforced by more vigour than fairness. He did not draw that distinction which was not infrequently drawn between Ruskin as the art critic and as the social reformer, because in spirit he saw none. The same principles which coloured his art criticism led him inevitably to prove their application to all phases of life. The secretary announced, with reference to the question of placing a tablet in Westminster Abbey, that it was arranged that the Union should make no appeal until this was settled, and it was also decided that the memorial committee, which was not a Union committee, should endeavour to obtain the necessary funds for the tablet without making a national appeal. The Union passed a resolution "in full sympathy with Canon Rawnsley and others who are working with him in the

Lake district against the proposed introduction of light railways and electric traction in the best and most picturesque part of that district; in this they are acting in harmony with Mr. Ruskin's life-long endeavour.

THE CITY CHURCHES.

HOW TO OBTAIN PERMISSION TO SKETCH AND PHOTOGRAPH IN THEM.

IN view of the fact that so many persons are interested in sketching, making measured drawings or photographing in the churches of the City of London, the "City Press" is greatly to be praised for publishing particulars about the necessary permits that are in most cases first required. The list which appeared in our contemporary we now take the liberty of reprinting, but a few explanatory remarks are necessary in order that it may be thoroughly understood.

(1) Applications to clergymen are preferably made by letter, and should give some idea as to the writer's intentions and qualifications. A suitable reference is sometimes advisable. (2) Permission should always be obtained for photography (with two exceptions), and for studies involving measuring, the use of ladders, &c. (3) Except when specified below, no fixed period exists for permits which may be granted. Each application is considered individually; hence a reason for stating the object in view. (4) In most cases it is impossible to give concisely the hours during which studies may be pursued. Festivals and Bank Holidays must be considered excepted. "Saturday cleaning" does not necessarily mean that the church in question is closed for prayer or meditation. The method aimed at has been to give only the hours of opening and closing, but in cases where the church opens with Matins or closes with Evensong the time occupied has been left out of consideration, e.g., Allhallows, Barking, is open for prayers between 7.30 and 8 a.m., is reopened at 10 a.m., and closes after Evensong, which is said from 5 o'clock to 5.30 p.m. The hours listed are merely 10 to 5. It is, of course, distinctly understood that no study can be pursued in any portion of the sacred edifices during the hours of service, or immediately preceding them.

ALLHALLOWS, BARKING. — Applications should be addressed to any of the clergy at 9 Trinity Square. Permits last three months. A voluntary subscription suggested to Restoration Fund. Hours, 10 to 5.

ALLHALLOWS-ON-THE-WALL.—Sketching freely permitted. Hours, 10 to 4; Saturday, 10 to 2.

ALLHALLOWS, LOMBARD STREET.—Apply to the rector, or, in his absence, to the curate-in-charge. Wednesday and Friday, 12 to 2.

CHRIST CHURCH, NEWGATE STREET.—Apply to the vicar. Permits last three months. Hours, 12 to 2; Saturday, 12 to 4.

ST. ANDREW UNDERSHAFT.—Apply to the rector. Church opens 12 to 2 for prayer and meditation only. Arrangements should be made with the verger as to times of sketching, &c.

ST. ANNE AND ST. AGNES, ALDERSGATE.—Sketching, &c., not permitted.

ST. AUGUSTINE, WATLING STREET.—Apply to the rector and churchwardens.

ST. BARTHOLOMEW-THE-GREAT.—Apply to the rector or churchwardens. Measuring not allowed. Permits granted at a charge of 6d. per week, or 2s. 6d. for photography. Hours, 9.30 to 4.30.

ST. BOTOLPH, ALDERSGATE.—Apply to the rector. Church open 12 to 5 for prayer and meditation only. Arrangements can be made for properly qualified students in the forenoon.

ST. BOTOLPH, ALDGATE.—Apply to the vicar. Hours, 11 to 12, or by arrangement. *Pro tem.*

ST. BOTOLPH, BISHOPSGATE.—Apply to the rector or churchwardens. Hours, 11 to 1. Saturday cleaning.

ST BRIDE, FLEET STREET.—Apply to the vicar. Notice that a permit has been obtained must be given to the parish clerk.

ST. CLEMENT, EASTCHEAP.—Apply to the rector. Hours 12 to 3.

ST. DUNSTAN-IN-THE EAST.—Sketching freely permitted. Hours, 10 to 4; Saturday, 10 to 2. Permits granted for measuring and photography; such studies must be carried on before noon.

ST. EDMUND THE KING AND MARTYR.—Sketching freely permitted. Hours, 10 to 1 and 3 to 4. Mondays preferred. Saturday, cleaning.

ST. ETHELBURGA, BISHOPSGATE.—Apply to the clergy. Hours, 10 to 2, or at other times by arrangement with the verger. Saturday, cleaning.

ST. ETHELDREDA, ELY PLACE (without the City).—Sketching freely permitted in the body of the church and crypt. Apply, for photography, to the rector. Measuring cannot be permitted owing to the extreme softness of the stonework. Hours, 10 to sunset. Crypt occupied on Saturdays.

ST. GEORGE, BOTOLPH LANE.—Closed by authority. Students and others desirous of obtaining admission should apply to the rector or churchwardens, and arrange with Miss Ward, 32 Botolph Lane and 10 Love Lane.

ST. GILES, CRIPPLEGATE.—Apply to the vicar. Hours, 10.30 to 4; Saturday, 10.30 to 1.

ST. HELEN, BISHOPSGATE.—Apply to the rector. Hours, 11.30 to 4. Saturday, cleaning. The brasses being in a chapel set aside for private prayer, any rubbings must be taken before or after these hours, and by arrangement with the caretaker.

ST. JAMES, GARLICKHITHE.—Apply to the rector. Hours, 12 to 2.

ST. KATHERINE COLEMAN.—Sketching freely permitted. Apply for measuring or photography to the curate in charge. Hours, 10 to 4.

ST. KATHERINE CREE.—Sketching freely permitted. Hours, 12 to 2. Written application to the rector or churchwardens necessary for measuring or photography, and these studies to be pursued at other times by arrangement with caretaker.

ST. LAWRENCE JEWRY.—Apply to the rector, who will arrange times, &c.

ST. MAGNUS-THE-MARTYR.—Apply to the rector. Arrangements can be made for study during the hours of daylight.

ST. MARGARET, LOTHBURY.—Apply to the rector. Hours, 10 to 5; Saturday, 10 to 2.30.

ST. MARGARET PATTENS.—Apply to the rector. Hours, every week-day, 11 to 3; Saturdays also, 7 to 9 p.m. After 3 p.m. on Saturday by arrangement with sexton.

ST. MARY-AT-HILL.—Sketching freely permitted between 10 and 12, and also between 2 and 4. Saturday, cleaning. Measuring and photographing on application to the rector.

ST. MARY ABCHURCH.—Apply to the rector. Hours, 12 to 2; Saturday, cleaning. Students may attend at other times by arrangement, and this is preferred.

ST. MARY THE VIRGIN, ALDERMANBURY.—Apply to the vicar. Hours by arrangement, the church being open only for service.

ST. MARY ALDERMARY.—Apply to the rector. Hours by arrangement. Saturday, cleaning.

ST. MARY-LE-BOW.—Apply to the rector. Hours by arrangement. Saturday, cleaning.

ST. MARY WOOLNOTH.—The rector grants permits. Hours, 10 to 4; Saturday, 10 to 12.

ST. MICHAEL, CORNHILL.—Apply to the rector. Hours, usually 12 to 2; closed on Saturdays.

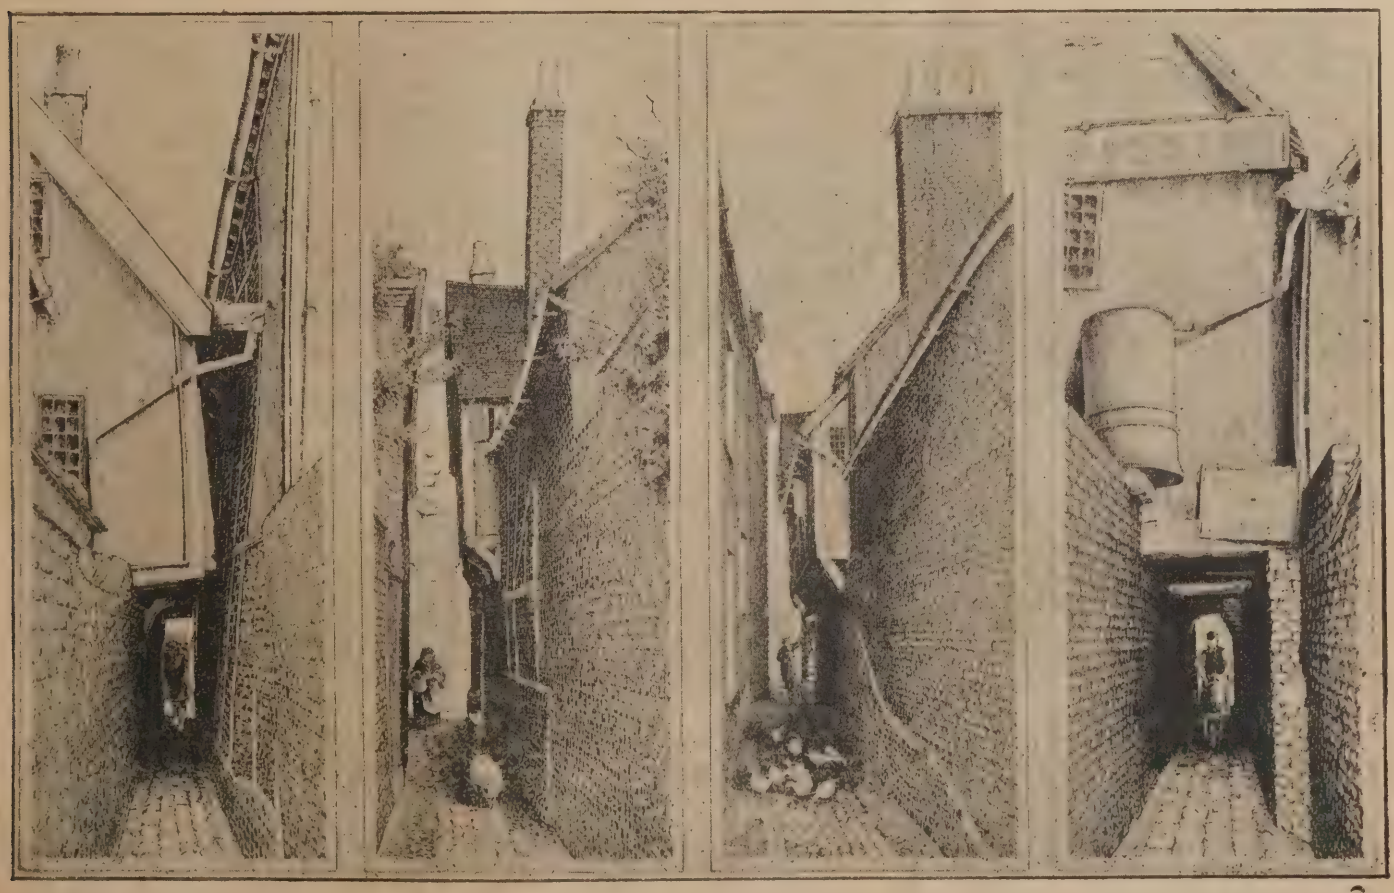
ST. MICHAEL, PATERNOSTER ROYAL.—Sketching and photography freely permitted between 12 and 2, except on Wednesdays and Saints' Days.

ST. MILDRED, BREAD STREET.—Church open at present 1 to 3. Sketching generally permitted provided it is accompanied by due recognition of the character of the building.

ST. NICHOLAS COLE ABBEY.—Apply to the rector. Hours, 11 to 4; Saturday closed. The facilities of electric light or ladders may generally be obtained on a small payment.

ST. OLAVE, HART STREET.—Small pencil sketches may be freely made, but for more lengthy work, for measuring, or for photography, permission should be obtained from the rector. Hours, 12.30 to 2.30; closed on Saturdays.

ST. PETER, CORNHILL.—Sketching and photography freely permitted between 12 and 2; closed on Saturdays. Apply for measuring to the rector and churchwardens.



ST. SEPULCHRE.—Apply to the vicar. Hours, 9 to 4.30; closed on Saturdays, except by special arrangement.

ST. STEPHEN, WALBROOK.—Apply to the rector. Hours 1 to 3; closed on Saturdays.

ST. STEPHEN, COLEMAN STREET.—Apply to the vicar. Hours, 12 to 2; closed on Saturdays.

ST. SWITHIN, LONDON STONE.—Sketching freely permitted on Monday, Tuesday, Thursday, and Friday between 1 and 3. Apply to the rector and churchwardens for measuring or photography.

ST. VEDAST, FOSTER LANE.—Apply to the rector. Hours, 12 to 5.

Between Ashton and High Street. In Church Street: "Little Alley." From High Street to Church: "Church Alley." Between Ashton and High Street.

FOUR OLD PASSAGES AT DUNSTABLE. DRAWN BY WORTHINGTON G. SMITH.

THE NEW METROPOLITAN TABERNACLE.

ON Wednesday last the Metropolitan Tabernacle at Newington, founded by the late Mr. Charles Spurgeon, was reopened. The fire which almost totally destroyed the building (which was erected in the years 1859–61 from the designs of Mr. W. W. Pocock, Mr. William Higgs, senior, being the builder) took place in April, 1898.

It was found that the walls and portico front, which were of very substantial construction, had not suffered to such an extent as to render it necessary to rebuild them, and as the building committee were very desirous of retaining all that they could of the former Tabernacle, and of reconstructing the edifice as nearly as possible on the former lines, it was decided that the portions left standing should be worked into the new construction.

The first thing to be considered was the accommodation of the church and congregation while the rebuilding took place, and at the suggestion of the architects (Messrs. Searle and Hayes, of Ludgate Hill) it was decided to clear away all walls and partitions from the old Sunday school, lecture hall, and classrooms which formed the basement of the former building, and to construct a large hall over the whole space capable of accommodating about 2,000 persons. To make this sufficiently high for so large an area, the basement floor was lowered several feet, and the hall was covered in by an iron and concrete flat, which was carefully asphalted, and on which the floor of the new Tabernacle has since been laid. This plan proved very successful, as it enabled the various organisations of the church to be carried on under its own roof, the rebuilding going on overhead all the time without any disturbance or difficulty. The cost of this lower hall was about £8,000.

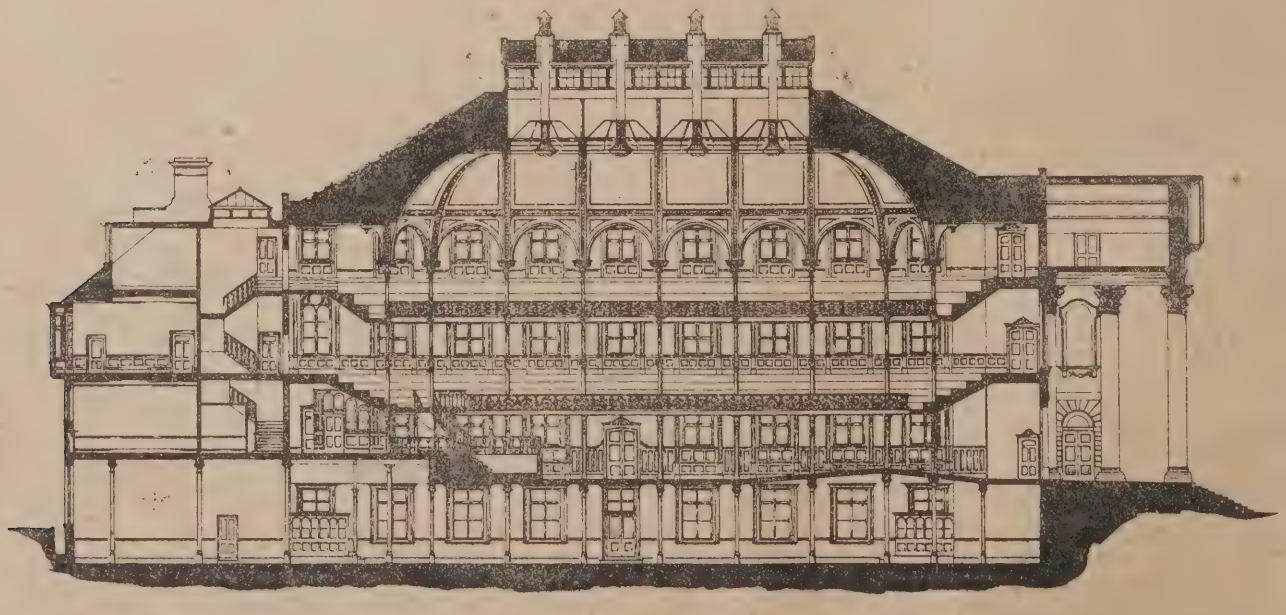
The reconstruction of the Tabernacle itself presented at the outset considerable problems, owing chiefly to the difficulty of adapting the former staircase buildings and approaches to the present requirements of the London County Council, and there were long negotiations between the district surveyor and the architects before a solution satisfactory to all parties could be arrived at. As now carried out, each of the two galleries has four stone staircases, and all the staircases are carried up separately, with brick walls between, and with short flights of steps and square landings, all communicating independently with the open air. The arrangements with regard to widths of staircases and exits are really considerably in advance of those actually required by the Building Act, but it was thought that everything possible should be done for the safety of the public in a building of this capacity. The chief alteration in plan that has been made is in the length of the auditorium, which has been decreased about 13ft. (or the length of one bay of the construction). The space thus obtained has been utilised by making the vestry building in the rear much larger, and has enabled the architects to very much improve the access to this part of the premises, as well as to increase the size of the rooms. Special baptising vestries have also been arranged for at the back of the platform, which will be a great convenience.

With regard to the materials and general construction of the Tabernacle, great alterations have been carried out, as it was felt necessary to make it as fire-resisting as possible, although the main appearance was to be kept intact. As formerly built, the roof, galleries, and vestries were all of timber and plaster, and the effect of this was apparent in the disastrous rapidity with which the place was burnt down. The vestry building is now entirely shut off from the main building by a brick party wall, and the rooms are divided off by pumice brick partitions. The galleries are constructed with bent plate steel girders, those to the first gallery projecting as cantilevers to form the balcony in front of the columns. These main girders support a network of steel joists, the whole being filled in with concrete made of coke-breeze and Portland cement, forming a strong and fireproof floor, upon which the dwarf walls supporting the staging for the seats are placed. The floors of the galleries are formed of thick planking, so as to resist fire and avoid the use of cross joists of timber. The roof of the Tabernacle is rather intricate in its construction: it consists of steel framed ribs, which cross the building from side to side, resting upon the main columns, the ribs being arched between the columns to the curves of the ceiling. These main ribs are braced together longitudinally with steel lattice girders, forming a strong skeleton framework; upon the ribs are placed the roof purlins, which are covered with stout boarding and slates, no rafters being used. The ceiling to the auditorium is formed with large slabs of fibrous plaster, which are fixed to binders resting on the main roof ribs; the centre part of the ceiling is oblong in form, the ends being semi-circular on plan.

The ornamental panels and shields in the dome are all capable of easy removal from the back; this will allow scaffolding to be put out at the upper level at any time for the purpose of painting or repairing the ceiling, and will save the heavy expense and inconvenience of constructing scaffolding from the floor below.

The arrangement of the pewing has been carried out much on the old lines, but the seats have been spaced out wider, and improved in various important details. The present accommodation is for 2,703 persons, including the officers' seats in the first gallery, which number 28. It will be seen that the seating capacity is considerably less than in the former building, and this is accounted for not only by the decrease in the length of the auditorium, but also by the wider spacing of the seats and the fact that the London County Council regulations demand more space for passages and aisles than used to be given.

The whole of the Tabernacle windows have been glazed with tinted glass, in lead lights, and with ornamental scrolls and borders, &c., adding much to the general effect of the building. The walls internally are painted a light olive-green colour. The lighting of the building is chiefly by electric light, but there are four large sunlights in the roof of sufficient capacity to light up the whole area in case of the failure of the electric current. The sunlights are also a useful adjunct to the ventilation, to assist the upward current through the ventilators in certain conditions of the atmosphere. The general ventilation consists of a system of vertical inlets, chiefly in connection with the heating coils, four large exhausts on the "air-pump" principle, and a complete arrangement of apertures in the upper lantern under easy control. The Tabernacle is heated throughout by hot-water radiators. The work of rebuilding has been admirably carried out by Messrs. Higgs and Hill, Limited, of South Lambeth, at a total cost of about £40,000.



Correspondence.

Bricklaying.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.W.

SIR,—In reply to "Sylas Syntax" (see page 114 of issue for September 12th), taking £4 19s. as prime cost per rod, a mean average is given as 550 bricks per day of nine hours. These figures are derived as follows:—Number of bricks per rod, 4,400; bricklayer's wages at 10d. per hour, 7s. 6d.; labourer's wages at 7d. per hour, 5s. 3d.; scaffolding not included. These figures are misleading, and they never came from a builder's or a surveyor's office, nor from a practical general foreman or bricklayer, but from a price book, which is often compiled by men of theory who know little about contracting. Builders are not inclined to make their secrets public, but the following particulars obtained from leading builders' managers, and proved correct, may be of interest. A rod of brickwork in practice contains only 4,000 bricks; one labourer to each bricklayer is a luxury—on buildings being erected as quickly as possible there are only two labourers to three

THE NEW METROPOLITAN TABERNACLE, NEWINGTON, S.E.: LONGITUDINAL SECTION. SEARLE AND HAYES, ARCHITECTS.

bricklayers (this does not refer to North of England). Apply these figures to price quoted and it will be found that 450 bricks per day will then be laid, and considering that my previous letter stated 500 to 600 per day, there remain 150 bricks to allow for several plumbing places and to prove me still "honest." Nobody would deny the facts stated by your correspondent about the number of bricks laid in the base of a chimney, but first-class men would not condescend to do such work. Imagine a solid wall sixteen bricks thick, and compare it with one two bricks thick; why it is like loading cargo into a vessel's hold.

The present price per rod for speculating work in London, including profit, labour, wear and tear and fixing scaffolding, is £4 10s. Allow 15 per cent. for profit, 5s. for scaffoldings, and there remains the sum of £3 11s. 6d. for bricklayers' and labourers' wages. Taking two labourers for three bricklayers and 4,000 bricks per rod, the average number laid per day will be 615. Now bear in mind how field-ranging is done. The walls are never flushed with mortar, except the last course, when left for next scaffold; corners are seldom plumb, and the work will not bear inspection. As the number stated is laid in the fields, a considerable reduction can conscientiously be made for warehouses and substantial structures. The three numbers mentioned in my previous letter are at present a little indefinite: 20 was for a large gauged arch with moulded soffit; 1,200 for footing and heavy breasts in flats; 2,300 for shaft bases and railway viaducts. "Sylas Syntax" should bear in mind that bricklayers are honourable human beings and not automatic machines working by the minute. There is still skill required in bricklaying, and it cannot be acquired through books at a technical school, or by working on a building for one month; proficiency is gained only by years of practice among qualified men.

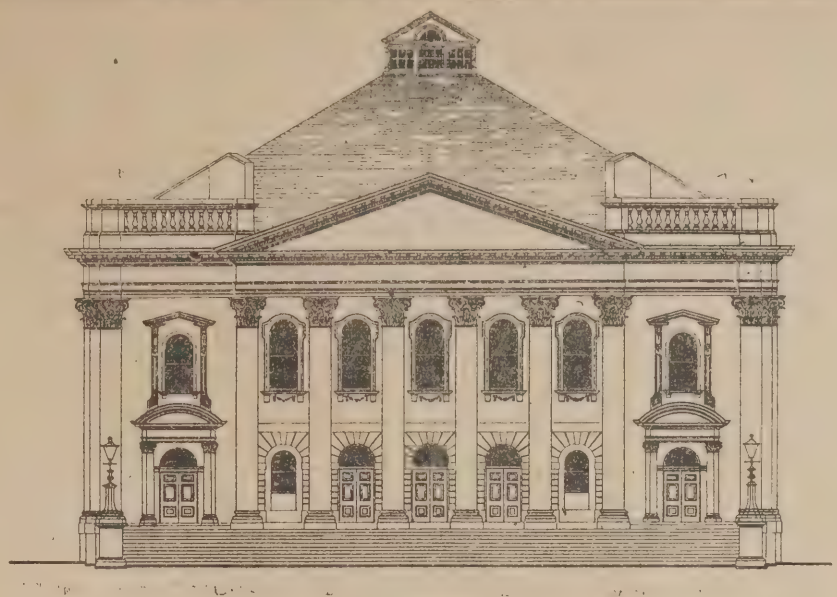
Yours truly,
AN HONEST BRICKLAYER.

Trafford Park Estate, Manchester.

To the Editor of THE BUILDERS' JOURNAL.

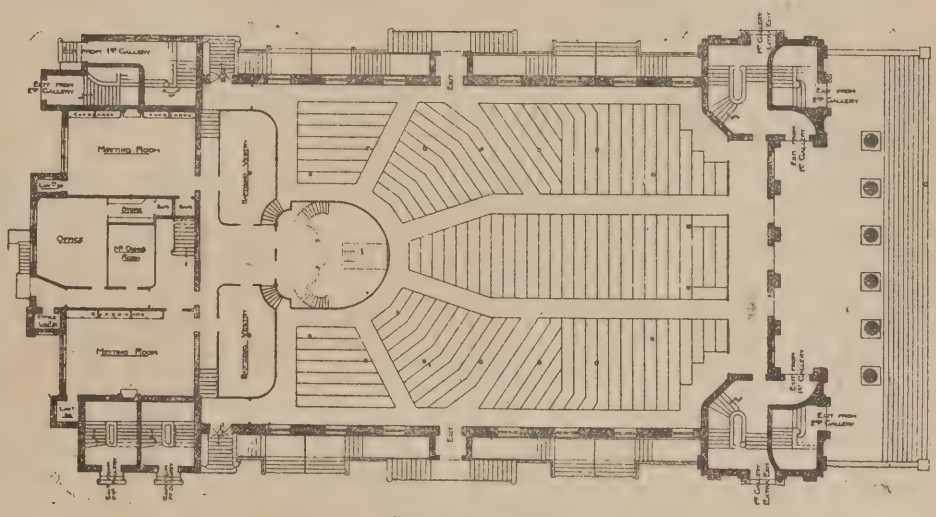
MANCHESTER.

SIR,—I am sure you would not knowingly print anything in your excellent journal that was not perfectly correct; but what you said in last week's issue respecting the Trafford Park Estate cottages and that estate is not at all accurate. The Dwellings Company have erected about 300 cottages for the working classes, but the streets will have trees on each side; the cottages are to be fitted with electric light, and each house has a bath. The main roads and streets are all to be handsomely lighted with electric lamps. In addition to this, spaces are reserved for workmen's institute, for schools and for a church: these are now under discussion. Your description is, therefore, misleading, and I should be obliged if you would kindly endeavour to undo some of the harm you may unwittingly have caused.—Yours faithfully, CHARLES HEATHCOTE.



[The information upon which our remarks were based came from a Manchester source, and there was every reason to believe that it was perfectly accurate. It appears, however, from Mr. Heathcote's letter that in some particulars at least our statements are incorrect.—ED.]

Architects' Assistants' Salaries.



To the Editor of THE BUILDERS' JOURNAL.

LONDON, S.W.

SIR,—My letter in your issue of August 9th has called forth several criticisms which need a reply. The hysteria of "Linear" hardly needs serious attention. The letter by "W. E. C.," however, evidences a most careful and consistent argument and deserves to have my position made clear. Perhaps the greatest principle of architecture is what has been called "functional expression." Without insisting too much upon exactness of wording, this principle applies generally to other art work, the material and function suggesting the form. Design should be constructive—or shall I say architectonic—and this is doubtless the reason architects succeed better than painters in designing, the latter being too prone to pictorial

Front Elevation.

Ground Floor Plan.

THE NEW METROPOLITAN TABERNACLE, NEWINGTON, S.E. SEARLE AND HAYES, ARCHITECTS.

effect. Of course "Linear" fails to understand how helping in draughtsmanship is not helping in building in proportion to one's position. The predominancy of drawing has been one of the great curses of architecture; it leads to pictorial expression. A composition on paper should be only a rough note at most. I quite agree with him that buildings are now often products of the head assistants—and nice things they are.

The Renaissance architects (equally with the Romans), struck by the refined austerity of Classic architecture, strove to recreate it. But the traditions that had produced the Classic style had run their course, and consequently these builders had to copy principles they thought to have been those of the originators. If this had stopped short at the mere elements of architectural effect all would have been well, but the decorative forms, the product of many brains and hands working for generations in one groove, were copied. With natural forms, the bases of all decoration, the same sources could have been gone to, but with the product of human tradition the sources had been stopped. While striving to reach a definite ideal the Renaissance architects did well, but the struggle for perfection ended in formalism, and of that they, like ourselves, soon tired. Then followed the Boroque and Rococo periods. The Renaissance diverted architecture from its orderly course of evolution, and gave it into the hands of the amateur. It made architecture a thing of fashion instead of a natural product of the people. We can admire St. Paul's Cathedral (instanced by "W. E. C.") in much, but we cannot take that intimate interest and admiration in its every part as we can in Mediæval or in original Classic work.

My opinion is that we shall never regain that architectonic character and invention in each and every part of a building until the producers have intimate knowledge by actual work of the material and its function. And in this we cannot start half-way; we must start at the beginning by refusing to copy anything and rejecting the amateur. In time building will again become traditional.

Of course, as "Linear" says, many assistants could not become master builders, but would be dressing stones or working timber, and quite rightly; many are not good for anything else. There are many now acting as architects and as assistants that would under the old Guild system never have risen to the position of head builder, or even of foreman. One must expect, where somebody's pocket and false pride are touched, to stir up bitter opposition. Such a guild system as they had in the past I would suggest for the future of architecture and of art. Such a system would not cause any loss of time in building operations, for all time-saving machinery we now have would be used, and ornate work that would take time would simply be omitted. What ornament we should have would probably be little, but it would be good.

The whole system of modern building seems to me to be out of joint. The trades' unions, brought into being to resist the action of "trusts," should not exist, but there should be one combined trade guild—"union," if you will—in which capitalist and workman are combined, with a regular system of promotion according to ability. The most capable should be the best paid; there should be no "percentage on the cost." I wonder some assistant does not suggest he should be paid a percentage; it

would be just as logical. I would say in conclusion: Mark, learn, and inwardly digest Ruskin's letter to the R.I.B.A. when rejecting the offer of the Royal Gold Medal; and remember: No "styles," but "style"; and: Be original, which is not necessarily the same as being new or novel.—Yours truly, UNTRAMMELLED.

[The correspondence on the above subject is now closed. See p. 142.—ED. B. J.]

Leaky Windows.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, W.C.

SIR,—It might interest both your correspondents and your readers generally to know that the narrow case sills Mr. Campbell Douglas advocates are invariably used in the south-west of Ireland. It is certain that all round the extreme west from the Hebrides to County Cork the ordinary English method of construction does break down when the Atlantic gales are driving the rain in sheets against the sashes. I have in Skye seen under these conditions a jet like a miniature fountain actually playing out into the room from the leeward corner of the sill, as though the window formed the front of a leaky aquarium, and this although practically all the precautions your correspondent Mr. Pendlebury shows upon his section had been taken, and some others in addition. Actual experience, too, soon convinced me of the necessity of following the local custom in Ireland, and I now always specify "single" sills for use there. It is the only real cure, nor in practice do any untoward results appear to follow; at the same time, I confess a preference for the English plan, as making more solid work when conditions permit. The difference of climate between West Hampstead and the West Highlands is far greater than the difference of opinion between your correspondents—greater probably than either of them realises, and the argument inevitably suggests the additional one concerning the silver shield.—Yours truly,

ALFRED C. HOUSTON.

Concrete Roofs.

To the Editor of THE BUILDERS' JOURNAL.

CROYDON.

SIR,—In a short article on "Concrete Roofs" which appeared on page 68 of your issue for August 29th last, it is stated that few roofs are more durable and effective, and that if cracks arise in the cement they can easily be stopped with cement and sand. As a matter of fact, no concrete and cemented roof will keep out rain for any length of time, except it be of very small dimensions, owing to the expansion and contraction which concrete undergoes when exposed to sudden changes of temperature, which is the case with all building materials. When cracks arise from expansion and contraction it is useless to stop them with cement, as they are sure to open again. The only way to make a concrete roof water-tight is to cover it with foreign mineral asphalt, which, being to some extent elastic, is not liable to crack. A roof of this kind is extremely durable, and costs next to nothing to maintain.—Yours truly,

T. POTTER.

Views and Reviews.

Cheap Houses.

THIS little book makes its appearance most opportunely at a time when the housing problem is engaging close attention. Of course, the subject is one that lends itself to fine writing, but this is not a defect, as it will make the book very readable to the ordinary building owner; but we cannot quite follow the authors when they speak, dealing with the working poor and the humanity of trying to raise them, of their "richer brothers" who would build a house 'far from the maddening (*sic*) crowd." Rural housing is perhaps more important than the housing of the working classes in towns, because, in addition to the distress, the agricultural districts cannot keep labourers there. The prices of labour and building materials have gone up of late years 30 per cent., and, in addition, the by-laws of the local authorities with regard to new buildings have become more stringent, thus defeating the principal objects they were framed to effect. Timber houses covered on the outside with plaster or tile hanging and plastered inside are as a rule far more weather-proof than those of 9in. brick walls, and are cooler in summer and warmer in winter than those of brickwork; yet this form of construction is usually barred by the by-laws. With the object of cheapening the building of small houses, Messrs. Clare and Ross suggest the use of their new patent mode of construction, consisting of a skeleton framework of fire-proof timber filled in with coke-breeze or other concrete, known as "Clare's Patent Concrete and Fireproof Timber Construction." This is claimed to reduce the cost by 33 per cent. compared with brick or stone walling.

The authors give some interesting and useful figures of the rents obtainable from small houses. They say that the cost at the present time of a pair of five-roomed cottages, planned with the most rigid economy, but built in stone or brick, which are practically the only materials recognised by the by-laws, is about £300, to which must be added £20 for the cost of land. Supposing the labourer to pay 3s. a week rent—a sum quite out of the question for the majority—the nett rent would be about 12 guineas per annum, a return of only 4 per cent. per annum on the outlay, which is not a fair return considering the risks of non-letting. The usually stated fair proportion of income to be devoted to rent is one-sixth, but the lower a man gets in the social scale the less he ought to pay for rent, and for the class under consideration the proportion ought not to be higher than one-tenth. The following table is worked upon this basis, and gives approximately the amount of rent that ought to be paid by the various working classes in country districts:—

	Average Wages per Week. £ s. d.	Rent per Annum. £ s. d.
1. Ordinary farm labourers.. ..	0 18 0	4 10 0
2. Foremen, team-men, shepherds and mechanical labourers	1 1 0	5 5 0
3. Signalmen, railway porters, mechanics, clerks, brewers' draymen, &c.	1 10 0 to 2 0 0	7 10 0 to 10 0 0
4. Small tradesmen and farmers	3 0 0 to 4 0 0	17 0 0 to 26 0 0

Messrs. Clare and Ross state that, assuming a minimum return of 5 per cent. on the gross outlay, allowing for rates, repairs and land, the outlay for Class 1 would have to be £71; for Class 2, £81 10s.; Class 3, £136 10s.; and for Class 4 £396. At present, no system seems to have been devised to meet the by-laws that makes it possible to build at the prices named for Classes 1 and 2. Of course this means that the by-laws ought to be altered. Clare's system can only deal with these classes if the building owner is prepared to rest con tent with a return of 2½ per cent. on the outlay. This is now being done by several philanthropists, but the authors make a mistake when they say local authorities make up the deficiencies from the rates. The Local Government Board insists upon the land and houses being bought by the rent within a certain number of years, and after that paying the same sum for the relief of the rates. The patent construction suggested complies with the local by-laws, and is stated to be more rigid and damp-proof than brick, and if rendered outside with cement rendering or tile hanging is proof against damp. It is claimed that the system can be carried out by unskilled workmen at a greater speed than in brickwork, and saves much labour. The book goes into full particulars and is illustrated with twenty-five plates of plans and sketches of cottages, bungalows and small country houses, farm buildings, schools and churches, with their cost stated. The buildings are usually planned square for economy.

With regard to the design of these small buildings the authors rightly state that "there is no reason why the smallest cottage or the simplest bungalow or country house, or even semi-detached villas, should not be as artistic in design as the manor-house or the vicarage. . . . True beauty in buildings is not proportionate to their cost, but depends on the degree in which they harmonise with their surroundings, they express their use, and their sound construction is evident. It also depends on the proportion of their various parts to each other and the skill of the designer in combining the various materials so as to produce a harmonious scheme of colour." It is rather surprising after this to find that the authors recommend "sham half-timbering," and introduce it rather freely into their designs. They also deal with the fallacy of supposing pleasing elevations to depend on applied ornament, and point out the waste of money by the speculative builder in that which is vulgar and meaningless. This, however, applies to plates 16 and 25. But on the whole the designs are estimable, the plans being well arranged and the elevations good, with the exception of the sham half-timbering before mentioned. Taking it as a whole, we can highly recommend the book. D.

"Ideal Homes for the People," by George E. Clare, M.S.A., and Walter G. Ross, A.R.I.B.A. Price 1s. 6d. nett. Published by the authors at 1 West Street, Finsbury Circus, E.C.

Builders' Notes.

Officers of the Joiners' Company.—Mr. Alfred Holt has been elected the master, Mr. Thomas Batten the upper warden and Mr. Frank Milton Ponder the renter warden of this guild.

Accident to a Carter.—Thomas Almond, a carter in the employ of Mr. Thomas Smith, a builder, of Croston, was in the act of getting some water from the River Yarrow behind a factory the other week, when the horse of which he was in charge became frightened by the steam from the exhaust-pipe. In endeavouring to pacify the animal Almond was knocked down, and the horse ran over him, injuring his spine and breaking two ribs.

Dearth of Houses at Elland.—Judging by the cases of ejectment which were before the Halifax West Riding Court recently, the Elland district seems to present a favourable opening for the operations of the speculative builder. In one case the defendant, who had admittedly paid his rent regularly, told the Bench that he could not get another house in Elland; and in another case the defendant, a widow, said she had been all over Elland, and there was not a house to let.

The Imports of Cement into Chili last year were valued at £48,494, as against £50,715 in 1898, when the total imports reached 16,637 tons. Germany was by far the largest sender of cement, her share being 9,972 tons, Great Britain only sending 4,428 tons. Chili is one of the largest consumers of cement in South America. Lately the average import has reached 100,000 barrels per year. Work on the sewers at Conception is now being pursued, and it is hoped that the Government will soon undertake the building of those at Santiago, in which case large quantities of cement will be needed. The yearly imports of the port of Talcahuano amount to from 15,000 to 20,000 barrels; those of Valparaiso from 40,000 to 60,000; those of Valdivia and Iquique from 5,000 to 15,000 barrels each. The importations at the ports of Talcahuano and Valdivia tend to increase owing to important railway constructions being executed in the South. Last year at Valdivia 41,199 barrels were unloaded, 27,569 of which came from Hamburg, 11,050 from London and 2,580 from Antwerp. Not one barrel was shipped from the United States. In regard to other markets in South America, Belgium furnishes three-fifths of the cement imported by Rio de Janeiro, Brazil, or 118,000 barrels per year. Even in Canada the Belgian imports exceeded 80,000 barrels, against 95,000 furnished by England. Belgian cement is also favourably known in Chili, and the Belgian consul urges that its importation could be successfully attempted on a much larger scale.

Dewlands, Black Notley, Essex, formerly the residence of Dr. John Ray, the first great English naturalist, was totally destroyed by fire last week. The house was almost entirely built of oak and plaster.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"Remember, child, that nothing is ever done beautifully which is done in rivalship; nor nobly which is done in pride." RUSKIN.

Our Plates. THE vicarage to St. Etheldreda's, Fulham, S.W., designed by Mr. A. H. Skipworth, is built in red brick, with tiled roofs, alternate courses of grey headers being inserted round the windows on ground floor. The wall over hall roof and front stairs is hung with weather slating. The builders were Messrs. Holloway Brothers, of Battersea, and the cost of the house was £1,800. —Mr. Pite's design for the staircase, Highcombe Edge, Hindhead, was exhibited at the Royal Academy last year.—An article dealing with the Shrewsbury sketches of Mr. Reginald M. Copnall will be found on page 153 of this issue.

Rossetti's Tomb by Madox Brown. A CORRESPONDENT to the "Times" says that whilst he was in the churchyard at Birchington recently he was much concerned to find that Rossetti's richly-sculptured monument, "designed," as the inscription tells, "by his life-long friend Ford Madox Brown," is injured irreparably by the action of the weather. Every part of the delicate and beautiful carving is sadly blurred and defaced. Some of it, alas! is almost obliterated. Most unfortunately, the stone on which the work was wrought appears to be of a very soft and perishable character. "If the Madox Brown designs are still in existence, as probably they are, it would seem to be no very difficult matter to substitute for the present monument an exact facsimile of it in its first condition, but wrought in some material much harder and more enduring. Doubtless amongst those who hold Dante Rossetti and his various 'things of beauty' in admiring and affectionate remembrance there are many who would right gladly contribute the necessary funds to carry out the work, and who would feel no little pleasure in thus erecting a most beautiful, appropriate, and lasting monument to the great poet-painter, the memory of whose brilliant genius 'the world would not willingly let die.'"

The Royal College of Art. THE premises of the Royal College of Art, under the Board of Education, at South Kensington, are being modified to meet the requirements of the reorganisation which has been adopted by the Board upon the advice of the Council for Art. This Council consists of Sir William Richmond, R.A., Mr. T. G. Jackson, R.A., Mr. E. Onslow Ford, R.A., and Mr. Walter Crane. The head master of the college is Mr. Agustus Spencer. M. Lantéri is the Professor of Sculpture and Modelling, and the appointments to the professorships of painting, of architecture, and of design are likely to be announced shortly. The total number of students to be admitted to the college is 350, of whom 150 may be fee-paying students. The fee for each fee-paying student will be £12 10s. per term, and there are two terms in each session of twelve months. All students admitted (either free or on payment of fees) must have satisfied the Council of their ability to profit by the special courses of instruction, to provide for which the college has been divided into an upper and a lower school. Students will be placed in one or other according to their proficiency, and will be required to pass through the four divisions of each school—namely, those for ornament and design, drawing and painting, modelling, and architecture. As part of the upper school course technical instruction will be given at evening classes in a few of the following subjects:—Book illustration, etching and lithography, stained glass, stone and marble carving, wood carving, mosaic, plaster and gesso work, metal work, shuttle weaving, tapestry weaving, embroidery, furniture and cabinet work, pottery, &c. The day classes will meet from 9.30 a.m. to 3.30 p.m., and the evening classes from 6 p.m. to 8 p.m. The college will be opened on October 16th next instead of the 3rd prox., as previously announced. Full information is given in the prospectus of the college, copies of which may be obtained from the offices of the Board of Education at South Kensington.

Building By-Laws and Old Houses. THERE is some force in the arguments now being offered in support of a relaxation of certain by-laws in the case of buildings in what is known as "Old Devonport," Plymouth. In Fore Street, for instance, where most of the houses were in existence long before present-day regulations were heard of, the by-laws practically prohibit improvements, as the houses cannot be rebuilt in conformity with the by-laws without a very great sacrifice, and owners prefer to allow the old buildings to remain. The Borough Council has decided to attempt the task of revising the by-laws, apparently with the view to their being modified in their application to these streets; but there is evidently a commendable desire to apply the regulations very strictly in the laying-out of new sites. Sufficient was said at the last Council meeting to show that to give discretionary powers to committees who pass building plans is not desirable. Even county councillors are but human, and one member expressed the fear that the granting of discretionary powers would result in favouritism in the case of those who had friends on the committee.

Army Huts. MESSRS. HUMPHREYS, of Knightsbridge, have recently been entrusted by the Government with the construction of a number of huts for the officers, non-commissioned officers, and men who are to form the army of occupation in South Africa at the close of the war. Huts providing accommodation for 30,000 troops have already been ordered, and the work is being carried out as quickly as possible. The warrant officers' quarters will be 60ft. long and 20ft. wide inside, divided into twelve rooms. The hut is constructed of timber framing, covered outside with corrugated iron, lined with felt, and inside with deal match-boarding. The men's huts, accommodating thirty men and one non-commissioned officer, are 113ft. long and 20ft. wide. The huts are being fitted up complete in every detail, and are thoroughly ventilated. Some of them are now being erected at Chelsea Barracks, where they are inspected by the officials of the War Office. They are then taken down and packed for shipment. When packed the men's huts each weigh about thirty-five tons, and the warrant officers' about twenty tons.

London Residences of Famous Persons. THE Society of Arts are to be much commended for their practice of erecting memorial tablets on the houses in London occupied by famous men and women. Two have been erected in Gerrard Street, Soho —one to Edmund Burke and the other to Dryden; a similar number in Leicester Square, to commemorate the houses of Sir Joshua Reynolds and of Hogarth; and others to Robert Browning (19 Warwick Crescent, Paddington), Lord Byron (16 Holles Street), Mrs. E. Barrett Browning (16 Wimpole Street), George Canning (16 Conduit Street), George Cruikshank (263 Hampstead Road), Madame D'Arblay—better known as Fanny Burney when she lived with her father in Sir Isaac Newton's old house in St. Martin's Street, which is also commemorated —(11 Bolton Street, Piccadilly), Charles Dickens (Furnival's Inn), Michael Faraday (2 Blandford Street, Portman Square), Benjamin Franklin (7 Craven Street, Strand), Thomas Gainsborough (Schomberg House, which forms a part of the existing War Office in Pall Mall), David Garrick (5 Adelphi Terrace), George Frederick Handel (25 Brook Street), Dr. Johnson (17 Gough Square, Fleet Street), Lord Nelson (147 New Bond Street), Mrs. Siddons (27 Upper Baker Street), William Makepeace Thackeray (Kensington Palace Green), Sir Robert Walpole (5 Arlington Street), Napoleon the Third (3A King Street, St. James's), and Peter the Great (15 Buckingham Street, Strand).

Cost of Building Country Cottages. WITH reference to the discussion about rural housing which has been going on in the columns of the "Times" Mr. T. Barrett-Lennard says:—"You cannot in England, under ordinary conditions, build a pair of cottages containing five rooms—viz., living room, back kitchen, parents' bedroom, boys' bedroom, and girls' bedroom—and provide privies, coal-house, and a well for less than £350 the pair, and this is, I believe, a considerably lower price than in most localities it could be done for. The rent in agricultural districts for such cottages would be about £7 the pair, rate free. This represents less than £1 15s. per cent. interest on outlay, without allowing anything for the value of the land upon which they are built or for the value of their gardens, and without deducting anything for the necessary continual repairs and for rates which the landlord has to pay, whether they be occupied or not. Obviously these deductions would more than swallow up the £1 15s. per cent. margin. Therefore desirable cottages cannot be built in the country to pay interest on the money they cost to erect. The only persons who, in fact, do build such houses are the owners of more or less large estates, who have considered it part of their duty to provide them regardless of the question as to whether it pays them to do so or not."

Proposed Municipal Buildings at Dorking. AT the last meeting of the Dorking Urban Council considerable discussion took place on the recommendations of the Office Accommodation Committee with reference to the proposed municipal buildings. These included (1) that the architect (Mr. W. Shearburn) be instructed to amend the plans in compliance with the following modifications:—(a) the cupola to be retained; (b) Bath stone to be substituted for Ancaster at a reduction in price of £150; (c) corridor on ground floor to be shortened at a reduction of £23; (d) one committee room to be dispensed with, the reduction being £190; (e) caretaker's rooms not to be erected, reduction £260; (f) skylight to be retained as on original drawing; (g) door to strong room not to be provided, the cost of which was estimated at £10—total, £633. (2) That the Council be recommended to instruct the architect to lay the amended plans before the General Post Office authorities for approval. (3) That the Council be recommended to pay Messrs. Bargman and Benison £15 15s., the amount decided to be paid to the architect whose plans were not accepted. Mr. Chaldecott moved the adoption of the report. Mr. Hubbard moved as an amendment that the original plan be adhered to, with the exception of the substitution of Bath stone for Ancaster. The Chairman said, even dispensing with a caretaker's room, they were still £1,000 over the estimate. The plans were prepared on the assumption that the outlay would be £5,000, but Mr. Tanner (the adviser to the Council) said it could not be done for less than £6,000, probably £7,000. Having heard these explanations Messrs. Hubbard and White withdrew their amendment, and the report was unanimously adopted.

Artisans' Dwellings in St. Pancras. THE St. Pancras Vestry last week approved an amended plan for the erection in Mornington Road, by the London and North-Western Railway Company, of a block of artisans' dwellings to accommodate persons dislodged by the extension of the Euston terminus. The Local Government Board being of opinion, contrary to the view of the London County Council, that the latter could legally contribute towards the cost of industrial dwellings on sites other than, and in addition to, the insanitary areas cleared the Board has asked the Vestry whether they were in a position to acquire by agreement sites outside the cleared areas for the rehousing of persons displaced by the Brantome Place and Prospect Terrace improvement schemes. The Vestry decided to inform the Board that "the Vestry are already in possession of land upon which dwellings for the working classes could be erected, outside the cleared areas."

Engineering Notes.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some more of their patent Manchester stoves to the Dinorwic School for the Llanddeiniolen School Board.

Electric Tramways at Folkestone.—The Folkestone General Purposes Committee has decided to recommend an electric tramway scheme, involving an outlay of £95,000. Councillor Jones proposed that the line should run along the beautiful Undercliff, but this was rejected.

Messrs. Graham and Co., Limited, of Black Bull Street, Leeds, have issued a new catalogue, illustrated by photographs, of the elevating and conveying plants which they have erected during the last twelve months. The firm have specially designed many plants for all classes of work and are ready to supply machinery for handling all kinds of building and engineering materials and goods.

A Remarkable Gas Meter.—At a meeting of the Rotherhithe Vestry last week a letter was read from the South Metropolitan Gas Company stating that it had just been discovered that the Vestry's gas meter at the public baths and wash-houses had been recording only one-tenth of the actual quantity consumed during the last eighteen years. The dial had registered hundreds for thousands and thousands for tens of thousands. The company, therefore, sent in a bill for these arrears, which amounted to £2,927 14s. 9d. The matter was referred to the Baths Committee.

A Course of Lectures for Mining Engineers, colliery engineers, enginewrights, apprentice mechanics and others has been arranged by the Council of the North of England Institute of Mining and Mechanical Engineers, in collaboration with the Council of the Durham College of Science, to be delivered at the Durham College of Science, Newcastle-upon-Tyne. The course will extend over three winter sessions, the fee being 30s. for the series of four courses given during each session. Further information will be supplied on application to Mr. F. H. Pruen, secretary, Durham College of Science, Newcastle-upon-Tyne.

Proposed New Dock at Goole.—The Highways Committee of the Goole Urban District Council have considered plans, presented by the Aire and Calder Navigation, for their new dock at Goole. The plans involve the alteration and removal of many of the Council's gas and water mains, and also provide for the provision of a new gateway from the railway dock. The Aire and Calder Company propose to erect a swing bridge to carry the highway over the gutway, which will be done by raising the level of the street on each side of the proposed bridge. It is intended that the present high-level railway, which crosses Bridge Street to the existing coal tips, be abolished.

New Water-Supply for Douglas, I.M.—The Water Committee of the Douglas Town Council have recently been engaged in considering the matter of the large new reservoir which is to be constructed near Injebreck in the West Baldwin Valley, for the purpose of providing an additional water-supply for Douglas. The Corporation, after some delay and difficulty, have now obtained possession of the necessary land for carrying out the work, and have called for tenders. The original estimate of Mr. Hill, the water engineer who is advising the Corporation, was between £49,000 and £51,000 for the whole of the scheme. Since then the prices of material and the cost of labour have risen. Mr. Hill made an estimate in relation to the construction of the reservoir and the laying of the mains—exclusive, however, of the cost of iron pipes. Tenders were applied for in connection with this estimate, and it transpires that the only tender received is very largely in excess of Mr. Hill's amended estimate. In view of the serious difference (amounting, it is said, to about £20,000) between the engineer's estimate and the price asked by the contractor, Mr. Hill has advised the Town Council to carry out the works themselves under the direction of the Water Committee.

New Bridge for New York.—New York is to have a double-deck bridge over the Hudson River, connecting the States of New York and New Jersey. It will have six tracks for steam railroads on the main level, and four trolley tracks, a roadway, and pedestrian and cycle paths on the upper deck, and will be a combination of the suspension and cantilever principles. The river span will be 2,730ft. from shore to shore. The height above mean high-water will be 160ft., and the extreme width of the structure will be 80ft. The foundations will be 170ft. below high-water, and the piers 62ft. in diameter. Private enterprise has projected the scheme, which is to be commenced forthwith.

Canadian Bridge-builders.—Work has been commenced on what it is stated will be the largest cantilever bridge in the world. It is being constructed by the Phœnix Bridge Company for the Canadian Government, and will span the St. Lawrence River at Quebec. The main span will be 1,800ft. long and the two end spans 600ft. each, the width of the bridge being 70ft. There are to be four lines of railway, a carriageway and two footways, which will be carried across at an elevation of 170ft. above water level. The Pittsburgh and Lake Erie Railroad Company are preparing to build a steel bridge of four spans across the back channel of the Ohio that lies between its lines and Neville Island, about six miles below Pittsburgh.

At the Theatre Royal, Manchester, new warming and ventilating apparatus has just been installed by the Sutcliffe Ventilating and Drying Company, consulting engineers, of Fennel Street, Manchester. A sectional steam boiler, with fire grate 33in. by 24in., is fixed in the basement behind the pit bar, and there are two main steam pipes (one under the floor at the back of the pit, the other taken down the centre of the pit to the orchestra); from these branches are taken to radiators under the pit floor and in all the entrances. There are no radiators, pipes or valves in the theatre proper, with the exception of two small pipes in the orchestra. A 36in. Sutcliffe fan driven by an electric motor forces fresh air over the radiators, the air being previously passed through a filter screen of coke. The fan will ordinarily change the whole of the air in the theatre in eighteen minutes; but at top speed this can be done in twelve minutes.

The Water-Supply of Southampton is not obtained in or near the borough, but from works situated between seven and eight miles away, the one belonging to the Corporation and the other to the South Hants Water Company. At both these works the water is obtained from wells and headings in the chalk, and, after being softened by Clark's process, is pumped into covered service reservoirs, by which pollution beyond the source of supply is avoided. The water from both sources is identical in character and maintains the highest standard of purity, as proved by the weekly analyses made by the borough analyst, and the slightest change in its constitution would be instantly detected. The water from the Corporation works has been reported upon in the most favourable terms by the late Sir Edward Frankland, Professor Dewar, Dr. Percy Frankland, and Professor Wanklyn. Professor Dewar and Dr. Frankland both say that precipitation after softening takes down any microbes which may be in the water, and there is consequently a safeguard in the case of both supplies beyond the proved purity of the water at its source. In 1888 the Corporation abandoned their old Mansbridge Works simply because the water then and there pumped from the River Itchen was *open to suspicion*, and it was feared might still deteriorate in quality. They have since spent large sums of money upon enclosing all reservoirs, duplicating and renewing mains, and generally keeping their water-supply in the most efficient condition. Messrs. J. Mansergh, G. H. Hill, G. F. Deacon, and G. J. Strachan, all engineers of eminence, have had occasion to visit and give evidence as to the character of the supply; nobody in possession of the facts could possibly see any necessity *to boil* Southampton water, as was stated a short time ago in a medical paper.

The Glasgow Electricity Supply.—The Town Council of Glasgow have just inaugurated two large additions to their works for the generation and supply of electricity for public and private lighting. The electricity stations in the city are now four in number. The pressure of supply in consumers' premises will be 250 volts by the use of a three-wire 500-volt continuous current system. This means a very large saving in the cost of mains, and the result when all is completed will be a more uniform light at a reduced cost. Electric lighting supply was commenced by the Corporation in 1893, the customers numbering 108, and the revenue amounting to £7,784. For the year ended May 31st last, the quantity generated was 5¼ million units, while the customers numbered 2,852, and the revenue amounted to £59,762.

The Charing Cross-Hampstead Underground Railway projected by Mr. Yerkes will run under Charing Cross Road to Oxford Street, where, at Tottenham Court Road, there will be a station with a connection with the Central London Railway; then through Tottenham Court Road to Euston Road (Drummond Street), where there will be a station, and stations will also be provided at Euston, giving a connection with the North-Western Railway, at Seymour Street, Camden Road, Chalk Farm, and Belsize Park, whence the line will proceed to its terminus, the exact position of which has not yet been decided on, at Hampstead. The length of the projected line, including the branch to Kentish Town, is about 6½ miles, and the total expenditure on the undertaking is estimated by Mr. Housman at between £3,000,000 and £4,000,000. The engineers are Sir Douglas Fox and Mr. W. R. Galbraith.

The Iron and Steel Institute opened its annual autumn meeting in Paris on September 18th, under the direction of the President, Sir William Roberts-Austen, who, in the course of his inaugural address, said that the metallurgist, by adding small amounts of matter to iron, had literally made it possible to change the aspect of the world. He had enabled such structural triumphs as the Eiffel Tower and the Forth Bridge to be constructed; he had created the Age of Steel, and of this age the palaces they had come to see on the banks of the Seine were the exponents, both as regards their construction and their contents. At the beginning of the century 6lb. of coal per hour were required to produce in a steam-engine one horse-power; now one-fourth of the above amount was sufficient—a result to which Regnault had in no small measure contributed. As regards one of the great processes of the century, the name of Sir Henry Bessemer suggested memories of close association with France. "We claim his process," said the President, "as one of the greatest achievements in the annals of British metallurgy, and we recall with pleasure how much Bessemer owed to the encouragement received from the Emperor Napoleon the Third. For my own part, being a metallurgist, I cannot expect that any importance will be attached to my individual opinion on an æsthetic question, but I would venture to observe that ideas of beauty are instinctive, and that pleasure in the contemplation of any work, whether of nature or art, depends on delicate and untraceable perceptions of fitness, propriety, and relation. This being admitted, I find myself unable to stand under the Eiffel Tower, and follow the course of the curved lines, which suggest the details of an immense but delicate coral, without being carried away by the impression that the structure is not only wonderful but beautiful." The meeting was resumed on September 19th, and on the next day excursions and visits were made.

Large Failure of Builders.—At the London Bankruptcy Court, last week, upon the petition of the debtors themselves, a receiving order against Messrs. W. Edwards and E. Medway, builders and contractors, of Ethelred Street, Kennington, was made. The liabilities are stated to be between £15,000 and £20,000. Debtors having several large School Board contracts on hand a special manager has been appointed to carry on the business up to the first meeting.

SHREWSBURY SKETCHES.

BY REGINALD M. COPNALL.

SHREWSBURY is one of the many places in England where both the artist and the architectural student can find plenty of subjects for brush and pencil. The whole county of Salop swarms with interesting old abbeys, castles and country houses of nearly every period; and for one who prefers the works of nature, pure and simple, for the subject of his sketch, there is plenty to hand in the woods and fields, among the Stretton Hills, or along the banks of the Severn.

Many of the old buildings in and about Shrewsbury are of historic interest, and quaint old gabled houses or fine mediæval buildings are to be seen at nearly every turn. The sketches accompanying these notes show a few of the old "bits" with which the town abounds.

The Church of the Holy Cross, commonly called "The Abbey Church," stands on the site of the old Monastery of St. Peter and St. Paul, but only scattered fragments remain now of the original building, for the street called Abbey Foregate has been cut through the cloisters, and a wooden shed, intended for a station of what proved a railway fiasco, together with a coal yard, now debase the site of the Refectory. For some years the nave, with its aisles, western tower and north porch (see illustration), constituted the parish church of the Holy Cross, but in 1887 a chancel was added and other alterations made from designs by the late Mr. J. Pearson, R.A. The chancel is in Early English style and is a very pleasing addition to the church. The large Perpendicular window in the west front of the massive square tower is filled in with armorial bearings in stained glass. Those who are interested in ancient monuments will find several very fine examples in the nave.

The Reader's Pulpit (illustrated) was originally part of the outer wall of the Refectory. It is octagonal on plan, with six trefoil-headed openings, the lower parts of which are filled in with sculptured panels representing saints, &c. The roof is vaulted. Familiarity evidently breeds contempt, for this splendid old relic is closely fenced in with iron railings, like a tomb,

READER'S PULPIT, SHREWSBURY.

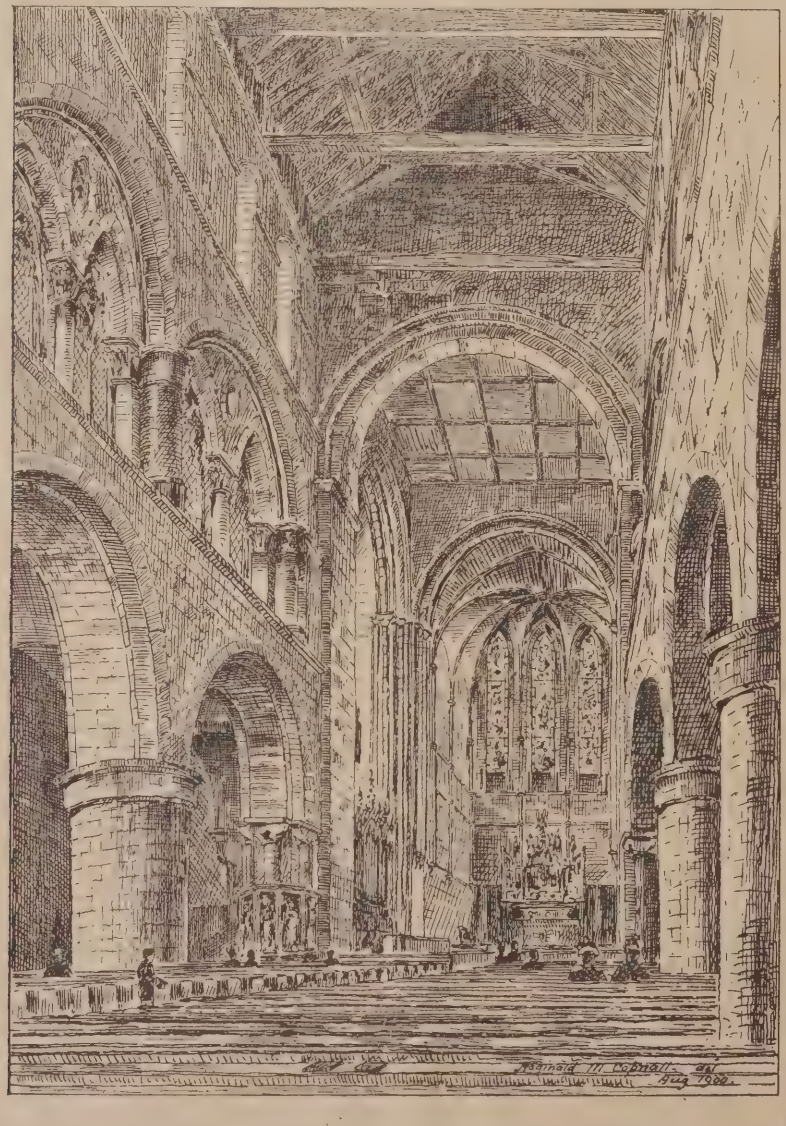
and is surrounded by heaps of coal, bricks and drain pipes. It is surprising what a number of years the structure has been allowed to remain in such a state of neglect, and one wonders why the authorities do not open out the ground to the street, put down turf, and plant shrubs to hide the sordid surroundings, and so make a pleasing feature of what is now an eyesore.

The old Watch Tower, the only remaining part of the town walls, is another interesting building, and, although it leans well out of the perpendicular, it seems capable of weathering many more years to come.

Fish Street (see inset sheet), in the view of which we get the tower of St. Julian's Church and the spire of St. Alkmund's, has several half-timbered buildings, as have also the adjoining streets, Grope Lane and Butcher Row, the latter containing almost perfect examples of fifteenth-century shops. There is an interesting half-timbered building at the corner of the old Square and Princess Street. The windows and shops are modern; it is to be regretted that so many of these buildings have been mutilated to form shops. Hill's Lane is a narrow street leading out of Mardol. The double-gabled building shown has a half-timbered front, and is dated 1440. Adjoining the old houses illustrated is Rowley's mansion, built early in the seventeenth century by a Shrewsbury alderman of that name. Like the Reader's Pulpit, it has been left uncared for, and for some years has been used as a warehouse, after being stripped of all its embellishments. The archway (shown in sketch) adjoining this building leads to an inn-yard, where one gets an idea of what a grand old place it was in former years.

NORTH PORCH OF ABBEY CHURCH, SHREWSBURY. DRAWN BY REGINALD M. COPNALL.

Masters and Men.



The Labour Market in August.—The Board of Trade report that employment in the engineering and metal trades has remained fairly good. The percentage of unemployed union members in this group of trades at the end of August was 2·8, compared with 2·7 in July and 2·6 per cent. in August, 1899. Employment in the building trades has remained good. The percentage of unemployed union members among carpenters and plumbers at the end of August was 1·8, the same percentage as in July. The percentage for August, 1899, was 1·2. In the furnishing trades employment has continued to fall off. The percentage of unemployed union members at the end of August was 3·0, compared with 2·6 in July. The percentage for August, 1899, was 1·9. Thirty-two fresh disputes occurred in August, involving 9,334 workpeople. Of these two occurred in the building trades, seven in the metal and engineering trades, and twelve in the mining and quarrying industries. Changes in the rates of wages of about 333,680 workpeople were reported averaging a net increase of about 2s. 9d. per head.

Labour in the Colonies.—The Emigrants' Information Office, 31 Broadway, Westminster, S.W., states in its monthly report, compiled from official and other reports, newspapers, &c., mostly dated July and August last, that at the Rossland mines in British Columbia, Canada, there is a good demand for blacksmiths, carpenters, timbermen, engineers and pump-men. In New South Wales work is being provided by the Government for men out of employment by starting necessary road-making and water conservation works, which will give employment to at least 2,000 men. At Melbourne, Victoria, there is a good demand for first-class plumbers and iron workers. There is a considerable number of unemployed persons at Melbourne, and it is proposed to provide work for them by carrying out railway extensions. In South Australia there is no demand for more labour. In Queensland there is a good demand for general labourers and for men in the building trades. In Western Australia, at Coolgardie and Freemantle, the supply of men in the building and other trades is greater than the demand; at Northam there is a demand for all kinds of labour except miners; at Perth the building and other trades have improved, but the demand is about equalled by the supply. There has been no lack of work in New Zealand, though, as this is the winter season, it has become somewhat less brisk in some outdoor trades. At Auckland and Napier the building trades have been busy. At Wellington and Nelson the building and engineering trades have been very busy. At Christchurch the building trades have been particularly busy, bricklayers having been in special demand; men in the engineering trades have also been fully employed. At Dunedin, carpenters, bricklayers and stonemasons have been fully employed, but painters and plasterers have been slack. At Invercargill the building trades—in which competent carpenters have been specially wanted—and the engineering trades have all been very busy. All persons are warned against going to South Africa in search of work. Cape Town and other towns are full of unemployed, and as the railways are now being used for military purposes only no persons can travel to the Transvaal till the war is over.

Professional Practice.

Aberdeen.—New premises have been erected for the Scottish Temperance Life Assurance Company, Limited, at 154 Union Street. The new offices consist of a large and commodious block with a frontage to Union Street of about 35ft., and extending back from Union Street to Diamond Lane for a depth of about 92ft. The buildings consist of practically two blocks, with connecting corridors between, the front block facing Union Street being six storeys in height, and the back block five storeys. Below the level of the street is a basement extending the whole length and breadth of the two blocks. On the street level there are two shops and saloons, also extending the whole size of the building, with entrances from both Union Street and Diamond Lane. Access is obtained to the first floor by a doorway and staircase leading from Union Street. On the first floor there are three suites of offices of from two to five rooms, with a strong room in each suite. On the second floor there are four suites of two to three rooms each, and also strong rooms. The third and fourth floors are occupied by a large dwelling-house, with three public rooms, six bedrooms, laundry and the usual accommodation. The front elevation to Union Street is built entirely of axe-dressed Kemnay granite, with the exception of two polished columns and two polished pilasters on the ground floor, which are of red granite. The main doorway is arched, with moulded consoles, panelled architraves and moulded pediments, and the ground floor windows have a deep granite architrave and moulded cornice. The first and second floors have semi-elliptical oriel windows, finished with cornices and moulded balustrade, and the upper floors have arched windows and columns with Ionic capitals, architrave, frieze, and moulded cornice, the dormer windows being surmounted by moulded pediments and shell ornamental and moulded finials. The back elevation to Diamond Lane is of a plainer description, but provision has been made for lighting the back suites of rooms. Light is obtained in the middle of the building by two large wells built with white-enamelled brickwork. The whole of the constructional work is of steel girders and stanchions. Electric light has been laid on throughout the whole buildings, and the corridors, lavatories, &c., have tiles on floors and walls. The contractors were:—Mason work, Mr. William Farquharson; carpenter work, Messrs. Watson and Robb; slater work, Mr. George Davidson, jun.; plumber work, Mr. David Ogilvie; iron work, Mr. George Bissett; plaster and tile works, Messrs. James Scott and Son; painting, &c., Messrs. George Donald and Sons; inside painting, paperhanging, &c., Messrs. J. and S. Fyfe; and electric lighting, Messrs. Pratt and Keith. The architects are Messrs. Jenkins and Marr, 16 Bridge Street, Aberdeen.

Chorley.—The Winstanley wing of the Chorley Cottage Hospital was opened last week. Mr. H. Dinsley, of High Street, Chorley, is the architect of the new wing. The building has a principal frontage to Lennon Street, and is faced externally with Accrington bricks, relieved with stone dressings. It consists of a receiving room, two wards, board room, operating theatre, four bedrooms, stores, cellaring, kitchen, and accompanying offices. The ward for men is on the ground floor, a corresponding ward being provided for women on the upper floor, which is reached from the central hall by a staircase of polished Derbyshire stone. The new operating theatre is also on the upper floor; the floor of this apartment is in mosaic, the walls being faced with tiles to the ceiling line. The room is fitted with the latest sanitary appliances, and is lighted by means of a roof lantern. Most of the floors are of fireproof construction; the flooring in the main corridor is in mosaic, elsewhere wood blocks or tiles being used. The dados of the wards, receiving room, corridors and hall are formed of coloured tiles, and glazed bricks have been used for the facings of the internal walls of the kitchen, offices and cellar. Two lifts have been provided—a stretcher-lift for patients and a lift by which food may be conveyed to the upper floor. On the north side of the institution, facing West Street, a plot of land has been laid out, boundary walls erected, and a carriage drive made from West Street. The cost of the Winstanley wing is estimated at about £4,000. Messrs. James Brindle and Sons, of Chorley, have been the principal contractors. The following are the sub-contractors:—Mr. Catterall, masons' work; Messrs. Gartside and Sons, plumbing and painting; Messrs. Samuels and Co., heating; and Messrs. Pilkington and Co., tiling.

INTERIOR OF THE ABBEY CHURCH, SHREWSBURY. DRAWN BY REGINALD M. COPNALL.

Colchester.—The Wesleyan Church in Culver Street, Colchester, has been re-opened after improvement and extension. The improvements consist of a new front to the church of semi-Classic design, carried out in white stone, and the addition of a suite of rooms, to be used for church and social work. A new organ has been erected by Messrs. Speechley and Sons, London, together with a new orchestra and a rostrum of pitch pine and walnut. The electric light has been installed, and the whole building will be lighted by electricity. Near the gates of the church a cottage for the caretaker has been built, and is designed to harmonise with the façade of the edifice. The whole scheme has cost about £3,000. The architects are Messrs. Goodey and Cressall, Colchester, and the builders Messrs. Dobson, of Colchester.

Harrogate.—The new Primitive Methodist church and schools, illustrated on page 155, were opened last week. The church stands at the corner of Bower Road and Dragon Avenue, and is built in the Decorated Gothic style of architecture, with a tower and spire at the corner rising to a height of 100ft. The church consists of nave and transepts, with an organ recess at one end, and provides accommodation for about 550, inclusive of an end gallery. The roof is an open one of pitch pine. The windows, which are traceried, are fitted with tinted leaded lights. The pews and other woodwork are of pitch pine. Adjoining the church is a schoolroom, 47ft. by 29ft., with an end gallery; a lecture room, 20ft. by 20ft.; and seven classrooms and vestries. A caretaker's house is also attached to the buildings. The architect is Mr. W. J. Morley, F.R.I.B.A., of Harrogate and Bradford. The contractors for the various works are Mr. H. Abbott, of Harrogate, masons' work; Mr. J. Lindley, of Leeds, plumbers' work; Mr. T. Laycock, Harrogate, for the plasterers' work; Mr. J. Rudd, Harrogate, joiners' work; Mr. J. Shepherd, of Harrogate, slaters' work; and Messrs. Varley and Roebuck, of Thornton, painters' work. The stained glass has been executed by Mr. W. Lazenby, of Bradford, and the heating apparatus was supplied by Messrs. England, Robinson and Co., of Harrogate.

London, W.C.—The building illustrated on page 157, and known as Nos. 25 and 26 High Holborn, has been erected for Messrs. James Buchanan and Co., the celebrated Scotch whisky distillers, on the site of the old "Black Swan" distillery in Holborn, the freehold site of this historical building having been acquired by Messrs. Buchanan a short time ago. The old "Black Swan" was destroyed by the Gordon rioters and rebuilt by the Government. Readers of Dickens will remember his stirring description in "Barnaby Rudge" of the destruction of these very premises. The old premises have been partly adapted for the present firm and partly rebuilt. Spacious stores have been erected in the rear, fitted with all necessary modern machinery for blending, bottling, &c. The upper part of the elevation is carried out

in Monk's Park Bath stone, the lower storey being in brown Portland. The architects are Messrs. Treadwell and Martin, of 2 Waterloo Place, S.W., and the builders Messrs. Patman and Fotheringham. The carving is by Messrs. Daymond and Son.

Pudsey.—Foundation and memorial stones were laid recently of the extension of the Pudsey Mechanics' Institute. Designs were invited some time ago, and those submitted by Mr. Herbert Hodgson, A.R.I.B.A., of Pudsey and Bradford, were selected. The extension, which will cost some £3,500, adjoins the existing hall, having frontages to Waver Green and Manor House Street. It will be four storeys high, and in external design will harmonise with the existing building, the principal external feature being a turretted gable facing Waver Green. A new entrance-hall to the whole building will be provided. On the basement floor there will be two new classrooms, and the existing tea room will be enlarged so as to be available, if desired, for use as two classrooms. On the ground floor, besides the entrance hall, will be two classrooms for instruction in commercial subjects, and on the first storey two similar classrooms, which, in conjunction with a master's room, the present lecture-room and a clay-modelling room on the second storey, will be devoted to art subjects. The second storey will provide three classrooms, which, with a room in the present building, will form the Science Department. Additional accommodation is thus provided for about 600 students.

Redland, Bristol.—A new Presbyterian Church is to be erected on a site adjoining Cranbrook Road, Redland. Messrs. P. Munro and Son, of St. Stephen's Chambers, Bristol, have been appointed architects, and have prepared the plans for the new church, which is designed in the Perpendicular style of architecture, and will be built with red Pennant stone and Bath stone dressings. It will contain nave, transepts, aisles, chancel, minister's vestry, choir vestry, church parlour, lecture hall, classrooms and caretaker's residence. The corridors, passages, lavatories, and part of the chancel, will be laid with encaustic tile pavement, and the chancel steps will be of red Wilderness Forest of Dean stone. The floor of the church and the whole of the subsidiary buildings will be laid with pitch-pine blocks. The roofs will be covered with red Broseley tiles. The pews will be of selected pitch pine and open, and the doors of English oak. The roofs will be open timbered in pitch pine, the nave having hammer beam principals, all the main timbers being moulded. The roof of the chancel will be waggon-shaped, with moulded ribs, and the whole of the roof timbers will be wrought to a fine smooth surface and left in their natural colour. The glazing throughout will be in tinted cathedral glass in lead squares and quarries. The heating arrangements for the church and subsidiary buildings will be by means of the hot-water low-pressure system, with pipes and radiators. The ventilation is to be by fresh air admitted into the ventilating radiators, thus being warmed before being admitted into the church, while the vitiated air will be carried off by means of Messrs. Boyle and Son's air pumps fixed in the roofs. The church will be lighted with the electric light, and will be seated to accommodate between 600 and 700 worshippers.

West Hartlepool.—St. Paul's parish buildings have recently been opened. The principal entrances are in Murray Street, on the east side, while Milton Road is on the south, and Alma Street on the north. They comprise Sunday-school, parish hall, and church institute. The accommodation for Sunday-school purposes is for about 1,200 children, while the large central hall, when seated for a general audience, will hold 600. The buildings are arranged on the ground floor, with large central hall 82ft. by 36ft., lighted by clerestory windows, with platform and retiring rooms at one end, and on either side are small class rooms, with a larger infants' class room, which can be used for the holding of sewing and smaller meetings. Under the platform is a service room, fitted up with large tea boilers and storage closets. At the Alma Street end, on the first floor, approached by a separate entrance in Murray Street, is the church institute, containing large billiard room with two tables, two games rooms, secretary's room, vestry, and organ chamber, on the ground floor, and a gallery on three sides of the church. The interior woodwork of pews, gallery and the waggon-headed roof is in varnished pitch pine. The total cost of the building is about £5,600. The architect is Mr. W. J. Morley, F.R.I.B.A., of Bradford, and the whole of the building works have been carried out by Mr. W. Gibson, of Exeter. The heating arrangements are by Messrs. John Weech & Sons, of Bristol, and the stained glass by Mr. W. Lazenby, of Bradford.

Worcester.—The Barnsley Hall Asylum Visiting Committee of the Worcestershire County Council have adopted a report made by Mr. G. T. Hine on the construction of the proposed new lunatic asylum, together with the two

PRIMITIVE METHODIST CHURCH AND SCHOOLS, DRAGON PARADE, HARROGATE. W. J. MORLEY, F.R.I.B.A., ARCHITECT.

lavatory, &c. The whole of the buildings are simply treated, with walls of red bricks and stone dressings. The interior of the hall is finished in brick of a deep red colour, with salt-glazed brick dados, and has open timbered roofs covered with Welsh slates. Mr. C. T. Watson, of the Central Estate, Hartlepool, is the contractor, Mr. R. Murray has acted as honorary clerk of works, and Mr. J. H. Morton, F.R.I.B.A., of South Shields, is the architect.

Weston-super-Mare. — A new Wesleyan church was opened on September 13th. Accommodation is provided on ground and gallery floors for about 900 persons. The style is Decorated Gothic, with tracery windows of Bath stone (filled with leaded lights). The front of the church faces Station Road and at the north-west corner is placed a tower with spire rising to a height of 120ft. The building consists of nave, transepts, chancel, minister's

designs referred to in it, and the plans have now been submitted to the Lunacy Commissioners for their formal approval. Mr. Hine had been instructed to proceed with the preparation of the drawings for the whole scheme of the asylum buildings. Mr. Hine's report says he has prepared a design for buildings accommodating 570 patients proposed to be erected in the first instance; and for the remaining blocks accommodating 280 patients. The present plan comprises all administrative buildings and offices necessary for an asylum for 850 patients, excepting only a chapel and a residence for the medical superintendent. The laundry buildings and workshops are of sufficient capacity for an asylum for 1,200 patients, and all that will be required when the committee extends the asylum will be to add to the machinery and plant in these buildings without making any structural additions or alterations. He

gathers from the Lunacy Commissioners' memorandum that they will allow the committee to postpone the erection of a chapel until the main asylum buildings are ready for occupation, and possibly they will allow them to postpone the erection of an isolation hospital for infectious diseases, but whether they will agree to the proposal of temporarily housing the medical superintendent in the assistant medical officer's quarters is more doubtful. He suggests, however, that the committee should try them, and he does not propose to submit designs of those three buildings in the first instance. With regard to the nurses' and attendants' quarters, every nurse and attendant must have a separate room, but whether those rooms are in the wards or in a separate building is an open question. In most modern asylums a certain proportion of the rooms are in the wards, the remainder being provided for in a separate block, but in some a detached nurses' residence is erected. In his design he has suggested a compromise in the shape of a block near the administrative centre, with day and mess rooms on the ground floor and sleeping rooms on the first and second floors, and as that will be a little less costly than a separate detached residence and has the advantage of easy accessibility, with convenience of service, and a large open court, which can be laid out and planted as a garden, to look upon, the Commissioners will possibly allow it to pass. As to cost, at this early stage, and with such small scale plans to work upon, Mr. Hine can only give an approximate estimate. This approximate estimate is: Main asylum £165,750, engineering works (boilers and heating) £11,000, electric-lighting installation £8,000, well and pumping plant £2,500, laundry machinery £3,000, kitchen and baking machinery £1,200, fencing to airing courts £800, roads on estate £2,500, architect and clerk of works £10,650; total £205,400. These figures show an average price on 570 beds of £360 per bed, the high rate being due to the fact that the asylum is planned with the administrative department sufficient for future extensions: Add for future wards £32,437, additional engineering works £6,500, architect and clerk of works £2,163, and the total is £246,500, showing an average price of about £290 a bed on 850 beds when the asylum is completed, bearing a favourable comparison with the cost of several of the latest buildings for which tenders have been obtained.

New Patents.

These patents are open to opposition until October 29th.

1899.—Glazing Bars.—17,284. A. S. DEACON, 8 St. Peter's Road, St. Leonards-on-Sea. The bar is of rolled steel or iron and in cross section is cross-shaped, the side arms being short and projecting upwards to form a trough at each side; and there is a specially drawn lead cap with side arms and trough linings. It is claimed that the roof is perfectly watertight.

Mosaic.—17,382. W. KIERSCH, 3 Blackhorse Yard, Gray's Inn Road, London, W.C. This invention relates to a method of glazing pieces of glass with putty on perforated zinc, iron, copper, or any perforated material like woven wire canvas. The mosaic is applicable to the inside and outside of buildings, pavements, and in a number of other places.

Purifying Water Gas.—19,270. A. J. BOULT, 111 Hatton Garden, London, E.C. (communicated by J. E. Goldschmid, Frankfort, Germany).—A permanganate salt in the form of a dry cartridge is placed in the supply pipe as near to the consumer as possible, so that the gas passing over it becomes purified.

Stone Sawing-Frames.—21,211. T. PAWSON, Ashburnham, Lidgett Lane, Moor Allerton, Leeds. The object is to obtain increased speed with less driving power, at the same time getting a more even stroke and avoiding jerking. This is accomplished by extending the rods by which the frame is suspended and attaching to their upper ends, about the pivots, suitable counterbalance weights.

Fireproof Floors.—21,353. P. HOBBS, 6 Geneva Road, Kingston-on-Thames. The floor has metal joists and skewbacks with flanges or rebates to support fireproof slabs. An uninterrupted airspace is thus obtained between the ceiling and floor above without the need for iron bars or hangers. No temporary centering is required, thus reducing the cost and hastening the work of construction.

Pencil Compasses.—21,920. A. H. WOODWARD, Legge Lane, Birmingham. At the end of one leg the compass carries a levering attachment like a tie-clip, by which the pencil is held in place.

1900.—Incandescent Gas Mantle Supports.—7,185. O. FEHSE, 97 Hauptstrasse, Weissenberg, Alsace, Germany. The chimney has a metal cap with a steel wire running across from one side to the other. Another wire depends from this and supports the mantle over the burner.

Prisms for Lighting.—8,871. M. F. EWEN, 144 High Holborn, London, W.C. Prismatically-ridged glass sheets are usually formed by rolling or pressing while plastic. In order to have perfectly sharp edges, according to this invention the sheet of glass is bedded on suitable cement in a frame and the ridges are ground out, being afterwards polished.

Bricks for Arches.—11,798. E. BÖTTGER, Berg-Gladbach, Rhineland, Prussia. Instead of being wedge-shaped the bricks are formed of crescent shape. It is claimed that the arch is more easily constructed with these bricks.

The following specifications were published on Saturday last, and are open to opposition until November 5th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—11,548, EDWARDS, pumps. 17,592, SPRINGALL AND JONES, window fastener. 18,010, BROWN, manufacture of built-up veneer. 18,958, HENNIG, process for freeing chalk, clay or similar material from flint, stones or grit. 19,561, AYKROYD AND AYKROYD, acetylene generators and holders. 20,522, TEE, gas lamps. 20,655, ALBION CLAY COMPANY, LIMITED, AND LAWTON, apparatus for use in forming joint ends on electrical conduits, drain pipes, &c. 20,901, OLDHAM, windows. 20,985, JOHNSTON, construction of tramway rails. 21,086, NOËL, incandescent gas burner. 21,296, ROBERTS, ventilating bricks or blocks. 21,366, BIRCH, ventilation. 21,877, VOSMAER, electric arc lighting. 22,732, LEIGH (*Sprague, Bowles and Hill*), water-tight doors, fire shutters, &c. 25,075, BÜHNE, manufacture of metal shavings for cleaning and polishing purposes. 25,259, HOLROYD AND BOND, building bricks.

1900.—7,030, BROWN, gas generating apparatus. 10,114, LONG, guards for circular saws. 10,180, SELLARS, building blocks and structures. 10,586, MILNER, camera, more particularly intended for use in connection with architectural photography, for measuring angles. 11,330, ATKINS, nail-making machines. 13,136. SCHLICKEYSEN, brick-pressing dies. 13,683, ARMSTRONG, pumping machinery. 13,739, DAVIS, stop for doors, gates, &c.

Change of Address.—Mr. F. Baldwin, architect and surveyor, has changed his address from 8 Lion Street, Brecon, to 13 Frogmore Street, Abergavenny.

The Central School of Arts and Crafts.—The London County Council's Central School of Arts and Crafts (opposite the Regent Street Polytechnic) reopened for the fifth session on Monday last. The classes, which are all held in the evening, at nominal fees, are intended for the benefit of workers in the artistic crafts, and comprise architecture, silversmiths' work chasing and engraving, enamelling, stained glass, bookbinding, illumination, embroidery, &c. New classes are being formed in cabinet work and inlay, also repairing of books and MSS. The school has gained the distinction of a Grand Prix at the Paris Exhibition. Prospectus and all information can be obtained of the curator, 316 Regent Street, W., or of the Secretary, Technical Education Board, 116 St. Martin's Lane, W.C.

Surveying and Sanitary Notes.

Douglas, I.M., New Drainage is shortly to be commenced. The Broadway section of the scheme and the new high-level sewer along the Promenade will be the first begun. The whole scheme is under the supervision of Messrs. Stevenson and Birstal, engineers, of London.

Condemnation of Insanitary Dwellings in Aberdeen.—The Public Health Committee of Aberdeen Town Council have recommended that the dwelling-houses Nos. 3, 4, 5, 6 and 8 Rennie's Wynd should not, after October 31st, be inhabited.

New Gardens for Bournemouth.—The town council of Bournemouth have approved a plan for laying out new public gardens in the Alum Chine. It has also been decided to apply for powers to borrow nearly £200,000 to carry out a tramway scheme throughout the borough.

For Turning Sewage into the Medlock the Droylsden Urban District Council have been fined £25. When an inspector visited the works on July 14 there were six tanks and nine filters; the sewage was going through one tank and into the river raw, the other tanks and filters being unused.

Hyde Park is the site of the manor which belonged to the Church of Westminster till it became the property of the Crown in the reign of Henry VIII. by exchange for other lands. In 1652 this park contained 620 acres. During the usurpation it was sold in different lots and produced £17,068 6s. 8d., including the timber and the deer.

"The Paris Sewers" forms the subject of an interesting article by Mr. Adams, of York, in this month's Paris Exhibition number of the *Engineering Times*. The author's photographs are used to illustrate the article; of these the great ball for sewer flushing and the views at Gennevilliers and Bondy are particularly striking—the statistic curves show the effect upon the death-rate of improved sanitary conditions.

Adams' Patents at the Paris Exhibition.—The French licensees of these sanitary patents have gained a Grand Prize for the following specialities:—Adams' Patent Automatic Sewage Lift, Sewage Flushing Syphons and Bacteria Bed Apparatus, supplied in this country by Adams' Patent Sewage Lift Company, hydraulic engineers, of York; and Adams' Patent Automatic Flushing Tanks and Cisterns, Automatic School Latrines, Titanic Sanitary Ware, and Urinal Ranges and Controlled Closets, here supplied by Adams and Company, sanitary engineers, of Leeds.

Building Speculations and Footpaths.—A proposal to close or divert certain footpaths at King's Norton was publicly enquired into last week by the Public Works Committee of the King's Norton District Council. The promoters of the scheme are the West Suburban Estates Company, who in order to develop their Church Hill Building Estate wish to divert slightly the footpath leading from Church Road and Wharf Road towards Baldwin's paper works and the King's Norton metal works. It was stated that it was proposed to construct four roads, which would partly take the place of the present footpaths, while other sections of the paths would be slightly diverted. The alteration would add not more than eighty yards to the distance to be traversed by those who now used the footpaths. Strong opposition was offered on behalf of working-men using the footpaths. It was also urged that as the diversion would increase the value of the land—one ratepayer suggested by £2,000 or £3,000—the promoters should make some concession. The promoters guaranteed that the strip of land to be cut off by one of the proposed roads near the river should not be built upon without the sanction of the District Council, and towards the close of the enquiry offered to give up the rear portion of this strip for some public purpose—a swimming bath or a recreation ground had been suggested.

Insanitary State of the Darenth Valley District.—The Local Government Board has just issued the report of Dr. Sweeting, its inspector, who found that in the Darenth Valley and other districts around Dartford many of the dwellings are of wood, with leaking roofs quite innocent of eave-spouting and rainwater pipes. In some cases the floors are of brick earth and mud. Others, worse still, are built right against damp hillsides. The River Darenth receives a plentiful supply of sewage, but is used for drinking purposes and the cultivation of watercress, while many even of the wells along the valley are found to draw their supply from the river. Opposite one place where drinking water is taken from the river he noticed dead animals and sewage floating, and on the Thames side, at such places as Greenhithe, the wells really tap the waters of the estuary, proved by the fact that their level fluctuates correspondingly with the tides, and that the water is unpotable, as he states, is very probable after the influences of Barking Creek higher up the river. Ashes and refuse are turned into ditches, and the other sanitary arrangements are in keeping, the simple method often being followed of burying in the garden, or of the nearest ditch being called into requisition. Dr. Sweeting has recommended steps for reform to be taken without delay, including the adoption of the Housing of the Working Classes Act.

A Road-paving Experiment in the City is now being made. Hitherto, in the case of asphalt, the paving has been laid in such a way as to necessitate an upheaval of a considerable section in the event of its becoming necessary to repair pipes, &c., below the surface. A new system is now being given a trial. The paving consists of flags that are 9in. square, and are composed of an inch and a half of hardened asphalt and an inch of cement. The flags are laid on mortar, the asphalt side uppermost, with a bed of cement. The principal advantage claimed for them is that they may be taken up and relaid with the utmost ease and the minimum of expense. If a pipe needs mending only about a dozen blocks will have to be removed. At first the flags are dark grey in colour, but it is stated that after a week's traffic they will become light grey.

Street Paving Experiments in Basle.—The United States Consul in Basle reports that during the last few years a series of experiments in various materials for street paving have been carried out in that town. In 1888 the first wood pavement was laid in one of the chief thoroughfares, the material used being the *Pinus abies*, or fir, which covers the Jura and the Black Forest. In a few years the pavement was worthless and had to be restored, the same material being used, but being subjected to improved treatment, special care being taken to secure uniformity in the blocks. Again the pavement required renewal in a few years; the lack of sunlight in the narrow streets where the blocks are laid promotes decay in the wood, while the concentration of the traffic on the parts not occupied by the tram lines and the sharp shoes of the horses hacked the blocks to pieces. Hence the use of fir blocks has been abandoned; American pitch pine also has been rejected, on the ground that it has so much waste (sap wood) that its inspection is difficult. Larch from Valais (*Pinus larix*), resembling American larch, was laid experimentally in 1894, and is now in such a condition that an existence of nine or ten years is anticipated for it, and it is reported that this material proved fairly satisfactory in Paris. Oak and pine are rejected as unsuitable and too costly. On the whole, it has been decided to follow the example of Dresden and Leipzig and use Australian Karri wood. A square metre of this (10·76 sq. ft.) would cost much more than American pitch pine or larch from Valais or the Grisons, and about twice as much as the fir from the Jura or the Bernese Oberland at present used, but it has been found that it will last 18 years, as against ten years for the pitch pine, nine for the larch, and five to seven years for the local fir. This wood will, therefore, be used, not only for all extensions of the wood pavements, but for the repair of those existing at present. The streets now paved with cobble stones from the Rhine, as well as the macadamized streets, will in future be paved with large hewn quarry stones. A quartz sandstone from Alsace was tried a few years ago, with excellent results, especially when the stones were laid closely and carefully together, when, it is said, the street is almost as noiseless as if paved with wood. It costs about 10s. per cubic metre (35·316 cubic feet), and lasts 30 years. Belgian porphyry will also be experimentally used; it is said to be very durable, and to need hardly any expenditure for repairs.

PREMISES FOR MESSRS. JAMES BUCHANAN AND COMPANY, HIGH HOLBORN, W.C. MESSRS. TREADWELL AND MARTIN, ARCHITECTS.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Filtering Rainwater.

HEREFORD. — H. writes:—"Which is the best way to filter rainwater collected from the roof of a house (in the country), taken into a tank underground, and pumped up into an iron tank in the roof? Could the water be filtered to render it fit for cooking purposes—not for drinking (there is a separate supply for this)—either by a filter attached to pipe or in the tank?"

Before entering the underground storage tank, the rainwater should pass through a small roughing filter, having a layer of screened gravel and sand about 2ft. thick, so as to remove any dirt or solids in suspension. The filtering material should rest on a perforated iron plate fixed a few inches above the floor of the filter chamber. The further purification of the water may be secured by means of a Pasteur-Chamberland service filter (obtainable from J. Defries and Sons, Limited, 147 Houndsditch, London, E.C.) attached to the supply pipe from the roof tank. Both filters should be so arranged that they are readily accessible, and great care taken that the tanks and their accessories are periodically cleansed. It may be interesting to mention the precautions which the writer took during a six years' residence abroad in a locality where rainwater from the house roof constituted the sole water-supply for drinking and cooking purposes. Every year—towards the end of September—the roof was thoroughly overhauled, eaves gutters cleared,

and the roughing filter emptied, cleaned and refilled with washed gravel and sand. The underground rainwater tank was thoroughly cleaned, and the sides, roof and floor limewhited. The limewhiting assisted in the prevention of any fouling or accumulation of fungoid growth on the sides of the tank. The water when pumped from the tank was afterwards filtered, while that portion intended for drinking was also boiled as an extra precaution. In addition to the annual cleansing of the tanks, &c., the filters were cleansed at frequent intervals, so as to ensure the purity of the domestic water-supply. T. E. C.

Calculating Size of Posts to Support Verandah.

BECKENHAM.—ENQUIRER writes: "Please tell me how to calculate the size of three oak posts required for a 40-ft. span to carry a verandah 10ft. high and 4ft. wide, roofed with zinc."

One method of calculating the size of the posts is as follows:—Using the formula $S = \frac{a \times d^4}{L^2}$, where S = safe weight in cwt., a = constant (say 15, which is very safe), d = width of size of a square strut in inches, L = height in feet, we note that each pillar carries an area of 2ft. (half the width) by 10ft. (we presume that the ends are carried by walls and that the distance between posts is 10ft.) = 20ft. super. Allowing a weight of, say, 1cwt. dead load per ft. super (querist does not say whether his roof is flat, but we presume that it is, and so allow for the possibility of persons walking on it), we get the value of S = 20 cwt.

Then $20 = \frac{15 \times d^4}{10 \times 10}$

$\therefore \quad \frac{3d^4}{20} = 20$

$\therefore \quad d^4 = 134$

$\therefore \quad d =$ something less than 4 (say 4in. square).

If the roof is a lean-to one, take about half the weight for S. A. G. B.

Examinations for Building Surveyors.

BATH.—ENQUIRER writes: "What are the duties of a building surveyor? Has one to pass an examination, and if so, where is it held?"

The examination for building surveyors under local authorities is held in London at the Royal Institute of British Architects, 9 Conduit Street, W., in the months of April and October. Full particulars will be found on the form to be obtained on application to the Secretary at the address given above; the particulars of all the examinations are to be found in the Kalendar of the R.I.B.A., to be published shortly, price 2s. 6d. A. G. B.

Books on Elementary Building Construction.

BATH.—ENQUIRER writes: "Kindly recommend a good book on elementary building construction."

There are a number of good text-books on elementary building construction; but perhaps the work which is most generally recognised as the standard work is "Rivington: Part I., Elementary; Part II., Advanced" (8s. each). Another book which contains a great deal of useful information in a smaller compass is C. F. Mitchell's "Building Construction," in two volumes (Elementary 2s. 6d., Advanced 4s. 6d.). Any of these books can be obtained from Mr. B. T. Batsford, 94 High Holborn.

A. G. B.

Taking Colours out of Old Maps.

LLANILOES.—W. M. S. writes: "I have a quantity of old coloured maps, and I want to take out the colours on them, which are red, yellow, green, and blue. So far I have only found out what will take out the red colour: how can I take out the others?"

We know of nothing that will take out or remove the colours mentioned from the maps if they are printed in colours or dyes. Chloride of lime water will remove certain wash colours, but it discolours the paper, &c. It will not remove a blue tint. The best thing we can recommend for this is to wash out as much as possible with clean water.

GEORGE PHILIP & SON.

R.I.B.A. Special Final Examination.

REDDITCH.—REX writes: "I understand that architects in practice, when twenty-five years of age, may sit for the Special Final Examination R.I.B.A. *only* when they can give sufficient reason for not having taken the progressive examinations. Is this correct?"

"Rex" should apply to the Secretary R.I.B.A., 9 Conduit Street, for particulars of the Special Final. The Kalendar (to be published shortly, price 2s. 6d.) will contain all the information required and the series of papers set at the Summer Examination. The examination is open to architects in practice who are more than twenty-five years of age, and to chief assistants more than thirty years of age, without the necessity for passing any other examinations. The usual "Testimonies of Study" required for the Final Examination are not required, but practical working drawings of a design by the candidate, a freehand shaded drawing and a perspective are needed.

A. G. B.

Openings for Architects' Assistants in Canada.

ASHTON-UNDER-LYNE. — BALBUS writes: "Could you give me any idea of the opportunities one would have in Canada as an architect's assistant? I have been thinking for some time of going to Montreal, but have been dissuaded in the meantime from doing so."

We have communicated with the office of the High Commissioner for Canada, but they would not advise our correspondent to go to Canada on the chance of procuring employment there as an architect's assistant. The demand for persons with his experience is fully met by the supply on the spot. They add: "Of course, if he has means and is independent of employment for a time, he might, as he became known, procure such a position, but we could hardly take the responsibility of recommending him to go out on chance."

Science and Art Examinations.

GLASGOW.—W. C. D. writes: "Having been in for Advanced Building Construction before, when I failed to obtain a first-class certificate, I am desirous of trying again by teaching myself. Could you kindly tell me through the medium of your paper how I could obtain a ticket for the Science and Art examination?"

For full particulars apply to the Science and Art Department, South Kensington, S.W.

Rendering Balcony Water-tight with Asphalt.

PENMAENMAWR.—J. H. J. writes: "I have just finished building a house, with a conservatory at the front, and instead of a sloping glass roof I have made it flat, and covered it with flooring boards so as to form a balcony. What kind of asphalt will make it water-tight, allowing 1½in. to 2in. thickness on the boards? The position is such that the sun strikes full on the porch."

I should recommend the flooring boards to be covered with 2in. of cement-concrete, on the top of which Val-de-Travers mastic asphalt should be laid in two separate coats, with a total thickness of ¾in. The asphalt, where it abuts against a wall, should be well tucked into a groove.

F. BAGSHAW, C.E.

Fixing Pencil and Charcoal Drawings.

SUNDERLAND.—T.W.F.K. writes: "Is there any cheap preparation to prevent pencil sketches from smudging and losing their sharpness of outline? Pencil is a so much more convenient medium than ink to work with out of doors that such information would be of great value to me."

There are several preparations for fixing charcoal drawings sold by the artists' colourmen which are equally applicable to fixing pencil sketches, and "T.W.F.K." can ascertain which are thought most satisfactory in Sunderland. The basis of the majority of them is spirits of wine and resin; they are sprayed on to the face or poured on to the back of the drawing. If the drawings are not likely to be exposed to very rough usage, a solution of gelatine, made with warm water, into which the drawings are to be dipped face downwards and set to dry the other way up, is generally effectual and is very inexpensive. A. W.

Treating Sewage from Dwelling-House.

YORK.—ASSISTANT writes: "In the rear of a house flows a natural stream, into which the overflow sewage from the dwelling has to be taken. The question is, how to do this without polluting the stream. You will get an idea of the size of the house from the sketch (not reproduced). The drains are taken to an inspection chamber within the stable yard. The level of the drains at this point—i.e. at the chamber—is 10ft. above the mean level of the stream. The water-supply for the house is obtained from a well. How would you deal with the sewage, commencing from the inspection chamber; and what would be the approximate cost of your scheme?"

An efficient system of sewage purification by means of bacterial filter beds should be adopted. The contact beds or filters might be conveniently constructed in the adjacent field, and any slight attention required could be undertaken by the gardener or groom. The average daily amount of sewage to be treated, and other local conditions governing the size and cost of the disposal scheme, are not given. In this instance, the most satisfactory results would probably be obtained from the "Scott-Moncrieff" (W. D. Scott-Moncrieff, 14 Victoria Street, Westminster, London, S.W.) or the "Septic tank" (Septic Tank Syndicate, 7 and 8 Bedford Circus, Exeter) systems of sewage purification. Further information may be obtained from the patentees of these systems, together with an estimate of cost, if the detailed particulars necessary to determine the size of the installation are given.

T. E. C.

Companion Volume to Parker's "Glossary."

H. M. K. writes: "Being interested in ecclesiastical architecture I should like to know whether it is possible to obtain Parker's companion volume to his "Glossary," third or fifth edition, *separately*, not exceeding 10s. in price. Batsford does not advertise the book in his catalogue, and Parker does not sell the "Companion" apart from the other two volumes of the "Glossary." As Bloxam's "Companion" volume can be obtained separately I thought the same thing might apply to Parker's."

It is a pity our correspondent did not write to Mr. Batsford direct about obtaining a second-hand copy of the companion volume to Parker's "Glossary" as he has a copy (third edition 8vo. cloth, 1841) which he can offer for 9s. 6d. post-free. All editions of the book have been out of print for the last thirty years. Mr. Batsford's address is 94 High Holborn, W.C.

Legal Registration of Architects.

WESTCLIFF-ON-SEA. — PHATMES writes:—"Is it correct that an Act of Parliament is about to be carried through requiring all architects and surveyors to pass a special examination?"

Our correspondent presumably refers to the Architects' Registration Bill, which, though several times brought before the House of Commons, has not yet been passed.

Cement for Wall of Racquet Court.

MANCHESTER.—RACQUET writes: "I have a racquet court to build 45ft. long and 22ft. wide. The game being played with a hard ball of small size the force of impact on the cement face of wall is very great. A smooth even surface is, of course, necessary. I have specified Portland cement, finished with Keen's, but am now told the latter is liable to peel off under the great strain. I should be glad if you could tell me which is the best method to adopt."

Keen's cement is not so hard as Portland, and would be damaged by hard balls; it would probably also flake and part from the Portland cement. The better plan would be to render and float the wall in one coat with Portland cement and clean sharp sand—1 of the former to 2 of the latter—and finish with neat cement, or half cement and half sand, ⅜in. or ½in. thick, trowelled to a smooth surface. The cement should be stale and finely ground, the second or finishing coat followed on the first before the latter becomes dry, and the work done in sections to provide against the slight expansion to which cement is liable, in the same way that monolithic paving is made. T. P.

Surveying and Other Books.

CAMBRIDGE.—E. W. B. writes:—"What are the names of some good books on the following subjects:—(1) Land surveying and levelling and elements of trigonometry. (2) Bookkeeping. (3) Practical measuring (oral exam.). (4) Bills of quantities. (5) Mensuration. (6) Law of fixtures. (7) Law of dilapidations. (8) Law of easements, light and air. (9) Constructive and working drawings."

We recommend the following:—(1) "Surveying and Surveying Instruments," by G. A. T. Middleton, A.R.I.B.A., 3s. 9d. "Elementary Trigonometry," by Rev. J. B. Lock (Macmillan and Co.), 4s. 6d. (2) "Builders' Book-keeping: a Perfected System," by Mr. Saker (published at 95-97 Finsbury Pavement, E.C.). (3 and 5) "Mensuration and Measuring," by T. Baker, 1s. 6d. (4) "Quantity Surveying," by John Leaning, 12s., "Quantities and Quantity Taking," by W. E. Davis, price 3s. 6d., or "Quantities," by the late Professor Banister Fletcher, F.R.I.B.A., 6s., and "Estimating," by George Stephenson, 5s. 6d. (6) "Fixtures: a Digest of the Law and Practice," by Sidney Wright, 5s. nett. (7) "Dilapidations," by E. Uttermare Bullen, 5s. 6d. (8) "The Law of Light and Air," by A. A. Hudson and Arnold Inman (Sweet and Maxwell), or "Light and Air" (Batsford), 5s. 6d. (9) "Architectural Examples in Brick, Stone, Wood and Iron," by William Fullerton, 15s., Spon. These books can be obtained from Mr. B. T. Batsford, 94 High Holborn, W.C.

Manufacture of Portland Cement.

HULL.—CONTRACTOR writes:—"I wish to know the latest method of manufacturing Portland cement. I believe there is an American method which is very economical in general cost. Is Roman cement used in conjunction with Portland cement for exterior plastering?"

I am not aware of any American patented method for manufacturing Portland cement, but new patents for kilns for burning the slurry and for machinery for grinding the clinker after it comes from the kilns are very numerous. Roman cement and Portland cement should not be used mixed together for external plastering; the former is quick setting and the latter slow setting. In a general way, Portland is very much better, and is invariably used for the purpose now. T. P.

Trade and Craft.

Fireproof and Soundproof Walls.

Particulars will be found on another page of the Fireproof and Soundproof Wall Construction Company, Limited, which has been formed with a share capital of £57,000 to acquire the business of the Fireproof Construction Company, Limited, patentees of the well-known Reiss system of wall and partition construction. Blocks or slabs of very light fireproof material, pierced by a series of tubes to make them sound-resisting, are used, and though only 3in. thick when plastered on both sides they take the place of a 4½in. or 9in. brick wall. This, of course, means a saving of weight and space, besides which the cost is 15 per cent. less than 4½in. brickwork of equal finish. The system has been specified and adopted by Her Majesty's Office of Works, the London County Council, the London School Board and numerous municipalities, and among the many large buildings where the walls and partitions have been constructed in this manner are the Guildhall School of Music, Drury Lane Theatre, Hôtel Windsor, Guy's Hospital, Kensington Palace, Poplar Hospital, Royal Academy, Earlswood Asylum, Model Lodging Houses, Birmingham, St. John's College, Cambridge, and the York Training College. Leading architects like the late Sir Arthur Blomfield, Mr. T. G. Jackson, and Mr. Roland Plumbe have specified or used the system, which is also excellent testimony to its value. The lists will probably be opened this week, and will close early next week.

A new Parish Room and Church of England Infants' School is being erected at Whiston, and will cost about £1,700.

Keystones.

To Commemorate the Deeds of General Buller in South Africa a town clock tower and church tablet are to be erected at Crediton.

A new Volunteer Drill Hall at Huddersfield is being erected by Messrs. Graham and Jessop, contractors, from the plans of Mr. W. Cooper, architect.

An Architect's Suicide.—In Leeds, last week, Lancelot Clarke, 29 years of age, described as an architect, lodging in Eighteenth Avenue, New Wortley, being engaged in connection with some railway engine sheds in course of construction in Oldfield Lane, committed suicide by poisoning himself. He came from Egremont.

The Alexander Theatre, Widnes, was burnt down last week. One of the gas jets at the rear of the building ignited the curtain, and flames quickly spread to the roof. An attempt was made to haul down the iron curtain, but it failed, and the whole of the scenery as well as the roof became on fire. The damage is estimated at several thousand pounds.

Proposed Public Hall for St. Andrew's, Cardiff.—A meeting of the St. Andrew's Parish Council was held at Dinas Powis last week to consider the advisability of providing a public hall for the parish, and it was intimated that General Lee, J.P., the chairman of the council, would give either money or its equivalent if the council decided to erect such a building.

Southmolton Parish Church, North Devon, is being renovated at a cost of about £2,000. The alterations to the edifice include taking down the north gallery, the removal and replacing of a stained-glass window, the relaying of the centre and sanctuary with Belgian black and Sicilian white marble diagonally, and white Sicilian marble steps and a dwarf screen of Caen stone at the entrance to the chancel.

A new Reredos at Winch (East) Church has been placed in the chancel. The work was entrusted to Mr. M. Maitland, of Bushey, Herts, designer and wood-carver. The reredos consists of panelling occupying the whole space of the lower part of the east wall. Each end is terminated by a loftier compartment, which is surmounted by a canopy and finial, connected by a deeply-carved moulding.

Somercotes Church is to undergo considerable alterations. Plans have been prepared by Mr. Percy H. Currey, of Derby, one of the Diocesan architects. It is proposed to rebuild the nave of the church, which is a temporary erection. It is not proposed to alter the chancel, but a nave and aisles will be added, the chancel will be repaired and clergy and choir vestries built. These alterations will increase the present seating capacity of 300 to 450. The cost is estimated at between £3,500 and £4,000.

Cardiff Town Hall.—The following resolution has been adopted by the Cardiff branch of the National Association of Operative Plasterers:—"We earnestly urge the Town Hall and Law Courts Building Committee to proceed without delay with the building of the Town Hall and Law Courts in the interests of the operatives in the building trade and ratepayers generally. If the work is not carried out a large number of workmen will be forced to leave the town in search of employment, thus increasing the number of empty houses, which will mean a large reduction of the income from the rates."

Proposed New Technical Institute at Newport, Mon.—A Local Government Board enquiry was held recently with regard to the proposals of the Corporation to purchase a site in Clarence Place whereon to erect a technical institute and to dedicate the Marshes estate, or rather 21 acres of it, to the public for ever for recreation purposes, and for sanction to borrow £600 to erect thereon a public shelter, caretaker's cottage, &c. The total cost of the site for the institute will be £4,300, and the Corporation has asked for sanction to borrow £4,500. In connection with the site the Corporation has undertaken to widen Rodney Road, and to contribute half the cost of a new road which is to run from Rodney Road to Corporation Road.

A new Abbey Church has been erected at Rushden.

The Harlyn Excavations at the ancient cemetery are still in progress.

The Victoria Higher Grade Technical School at Ulverston was opened last week.

An Exhibition of Arts and Crafts is to be held in Leeds from November 19th to December 1st.

A Monument to the Memory of Queen Louisa, the great-grandmother of the German Emperor, has been unveiled at Tilsit.

The Ecclesiastical Art Exhibition at Newcastle-on-Tyne was opened by the Bishop of Newcastle last Saturday.

The Greencoat School, Camberwell Green, S.E., commenced its winter session of technical and art classes on Monday last.

The Offices of the Queen Anne's Bounty Board at 3 Dean's Yard, Westminster, have been rebuilt. In that portion which faces Great Smith Street the castellated style has been adopted, and in the outside wall there has been inserted a sculptured representation of Queen Anne distributing doles.

New Barracks at Colchester.—Building operations are now in progress at Colchester, consequent upon the increase of the garrison. The old Crimean hut barracks are giving place to a collection of brick buildings. These comprise the new Sobraon infantry barracks, the Gujerat infantry quarters, and accommodation for the Militia Medical Staff Corps.

University College Hospital.—The first wing and the central block of the new building which Sir J. Blundell Maple, M.P., has undertaken to erect, at a cost of over £120,000, are now ready for occupation and will be informally opened on September 1st. The plan in its entirety will be in the form of a diagonal cross. Special attention has been given to the requirements of modern medicine and surgery, and each ward will be completely isolated, except for its connection with the rest of the structure by bridges.

Classes at the Battersea Polytechnic.—Particulars of a large number of classes of interest to building trade students are given in the prospectus of the Battersea Polytechnic for the session commencing last Monday. In addition to the theory classes in all stages the Polytechnic also offers practical instruction in carpentry, brickwork, masons' work, plastering, plumbing and painters' work in the workshops, which are well fitted with necessary tools and apparatus. Other classes of interest to the building trades are those in municipal and civil engineering, drawing and design, land surveying and road-making, builders' quantities and sanitary science. A list of classes will be sent gratis on application to the secretary.

Mr. Robert Carfrae, F.S.A. Scot., died last week at the age of 81, at Murrayfield, Edinburgh. A partner of the firm of Moxon and Carfrae, decorators, George Street, Edinburgh, Mr. Carfrae had been for many years recognised as an authority on art matters. He was one of the oldest members of the Scottish Antiquarian Society, and acted for some years as honorary curator of the Antiquarian Museum. He was particularly interested in numismatic research, and of the early Greek silver coinage and the Roman first brass he had acquired several unique specimens. He was rarely an absentee from sales of pictures or antiquarian relics in the city.

St. Martin's School of Art held its annual exhibition of students' work last week at the School, Castle Street, Endell Street, W.C. The School is in connection with the Board of Education and the London County Council Technical Education Board. The Exhibition consisted of work done by the students during the year, and comprised specimens of all subjects connected with art designing, as applied to the different branches of trade which are practically taught, and the results have been very successful. The students have done well in the examinations held by the Board of Education, having gained one excellent, 24 first and 32 second-class certificates.

The Liverpool Autumn Art Exhibition was opened last week at the Walker Art Gallery.

New Church at Dundee.—The foundation stone of the new church of St. Mary Magdalene, halls and rectory, in course of erection in Well Road, Hawkhill, Dundee, was laid last week.

The Restoration of Tredington Church is approaching completion. The work has been proceeding for about three years, and the church is expected to be reopened on October 12th.

The Restoration of Westbury-on-Tyne Church, Bristol, is proposed to be completed by the addition of side screens. Designs have been asked for and will be submitted at the next meeting of the vestry.

The Building Trade in Kirkcaldy.—A considerable number of men in connection with the building trade are at present idle in Kirkcaldy district. There are prospects of a start being made shortly with the extension of some of the public works, while several burgh contracts are about to be settled.

Art Workers' Guild's Excursion.—A party of between thirty and forty painters, architects, and craftsmen, and their wives, sisters and daughters have left with the Art Workers' Guild expedition to Italy. The large majority of those composing the party are members of the guild. The party will return home on October 7th, after visiting Padua, Verona, Milan and spending a week in Venice.

Law Cases.

Leaving Material on the Road without Lights.—At the Sheffield Police Court last week two building contractors were charged with leaving building materials on the roads from sundown to sunrise without having lights attached to them. In the first case P.C. Morton stated that James Sivil, builder, of Hughenden Road, had been building in Windermere Road, and had left some flags in the roadway on the night of September 1st, without lamps fixed to them. Sivil explained that all the other materials were removed, but his man, who had been working until nine o'clock, and had left the flags close to a gas lamp, thought there was sufficient light from the lamp to show where the flags were, and that another lamp was not necessary. A fine of 7s. 6d. was imposed. Morton also stated that after dark on the same day he found in Grasmere Road some timber, a barrel and trestles, which had been left by Mr. J. S. Teanby, builder, of 11 Alcester Road. Mr. Teanby's manager stated that there was only some asphalt left in the road, and that did not belong to Mr. Teanby. A fine of 10s. was imposed.

Plumbers and their Charges.—At the Salford County Court, on Wednesday last, a case was heard in which the plaintiffs were Messrs. G. H. Openshaw and Co., plumbers, glaziers, and general contractors, of Old Trafford, Manchester, who sued Mr. Superintendent Bent for the sum of £2 15s. 11d. for work done at his residence at Croft's Bank, Urmston. The work consisted of the decoration of a room and the repairing of a pipe-burst. Mr. Chapman, who represented defendant, submitted that the charges in the invoice were exorbitant. The room was only 22ft. by 16ft, and for papering and colouring it and cleaning the cornice a charge of £1 12s. was made, and for repairing a pipe-burst to the bathroom £1 1s. 11d. was charged. The latter work, Mr. Chapman pointed out, took the man and boy fifteen hours. The sum of 4s. 6d. was put down for size and paste, and it was only a small room. His Honour: I should say there was enough for a whole street. Continuing, Mr. Chapman said that there were also the railway fares to Urmston for two persons. His Honour: Of course, a plumber never goes anywhere without a boy. A paper-hanger in the employ of plaintiff said it took him four hours to dust the cornice. His Honour gave judgment for defendant, with costs. The £1 15s. paid into court would be handed to plaintiff after the costs had been taxed.

TWO ARCHITECTS OF BATH.

MR. W. EMERSON, president of the Royal Institute of British Architects, unveiled two mural tablets in Gay Street and Queen Square, Bath, last Thursday. The tablets were erected by the Corporation on the houses in which the celebrated architects, John Wood, senior, and John Wood, junior, resided. These architects were responsible for many of the fine streets and squares for which Bath is famous, and Mr. Emerson spoke of the foresight exercised by them in laying out the city, and for want of which many cities, the Metropolis particularly, had been absolutely spoilt. He thought it was wonderful that those architects of 200 years ago, without the advantage of research and travel and without the books on architecture which were available to-day, were able to conceive such a scheme as the laying out of the city of Bath and to build such beautiful buildings as there were in the city.

Among the buildings with which the Woods enriched the city during the last century may be mentioned the Royal Crescent, immortalised by Dickens in "Pickwick Papers" as the scene of Mr. Winkle's midnight escapade with Mrs. Dowler; Queen Square, Gay Street, the famous Assembly Rooms, and the historic mansion of Prior Park, on the outskirts of the city, which, during the lifetime of Ralph Allen, its founder, was the resort of the most famous men of letters and distinction of the day. The names of Pope, Mason, Hartley, Richardson, the painters Hoare and Gainsborough, Bishops Hurd, Sherlock and Warburton, Lord Chatham and the younger Pitt represent but a few of those who, during the latter half of the last century, were intimately associated with this classic spot, while Fielding was a regular guest when he lived near, and it is easy to recognise in Ralph Allen, the genial host, the Squire Allworthy in "Tom Jones." The mansion of Prior Park, with its grand Corinthian portico, was built by Ralph Allen in order to demonstrate the qualities of the famous Bath stone, at that time but little worked. Now its reputation is almost world-wide, and the Prior Park mansion affords excellent proof of the adaptability of the stone to all the requirements of modern building.

New Companies.

Dudley and Son, Limited.

This company was registered on September 17th with a capital of £3,000 in £1 shares to acquire the business now carried on at Norbriggs Works, Staveley, Derby, as Dudley and Son, to adopt an agreement with J. R. Dudley, and to carry on the business of spade, shovel, pick, tool and cutlery manufacturers and merchants, metal workers, &c. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers.

Port Soderick Freehold Land Company, Limited.

This company was registered on September 13th with a capital of £10,000 in £1 shares to carry on the business of builders, contractors, mechanical and electrical engineers, timber, slate and coal merchants, carriers, joiners, plumbers, gas and water fitters, house and estate agents, &c. The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers.

Pear Tree Estates, Limited.

This company was registered on September 14th with a capital of £25,000 in £1 shares to adopt an agreement with J. Cruickshank, C. C. Cruickshank, Susan M. Viant, E. I. Jackson and J. C. Cruickshank, for the acquisition of certain lands and hereditaments at Pear Tree Green, Southampton, and to carry on the business of builders, contractors, engineers, timber merchants, &c. The first directors (to number not less than three nor more than six) are J. Cruickshank, J. C. Cruickshank, C. C. Cruickshank, Mrs. E. I. Jackson and Mrs. S. M. Viant.

London and County Syndicate, Limited.

This company was registered on September 17th with a capital of £500 in £1 shares to construct, equip and work public and private works, including railways, tramways, docks, wharves, water, gas, electric light, telegraphic, electrophonic and power supply, &c.

Tinsley Brick and Tile Company, Limited.

This company was registered on September 6th with a capital of £2,000 in £1 shares to carry on the business of brick, tile and earthenware manufacturers, miners, &c. The first directors (to number not less than three nor more than five) are G. R. Johnson, W. Johnson and W. A. Johnson.

An Episcopal Mission Church at Guardbridg is to be erected. The site is at the north end of the village. The dimensions of the church are to be 31ft. by 19ft. It will have a vestry and porch, and an open timber roof. The accommodation will consist of about 60 seats. The contractors for the work are—Mason, Mr. William Ness, St. Andrews; joiner, Mr. Andrew Thom, Strathkinness; plumber, Mr. J. M. Morris, St. Andrews; plasterer, Mr. A. R. M'Pherson, St. Andrews; and slater, Mr. William Greig, St. Andrews. The architect is Mr. C. F. Anderson, St. Andrews.

Military Extensions at Pembroke Dock.—Tenders have been sent in for the erection of the new permanent barracks at a cost of about £125,000. Messrs. Humphreys, of London, have secured the contract for £11,000 to build eight hospitals, each to hold 50 inmates from South Africa, on the upper side of the huts at Pembroke. The work has to be done at once, the contractors being required to complete their work in 10 weeks' time.

Mr. Dick Dix, the senior partner of the firm of Dix, Green and Co., builders, contractors and cement manufacturers, of Saffron Walden, died recently at the age of 62. Mr. Dix was born at Steeple Bumpstead, and crossed the Atlantic in one of the old sailing boats. He started with others in business as a builder at Chicago, and was doing well when the Civil War broke out and he was obliged to return to England. He went to Saffron Walden in 1870, and two years later started in business in the London Road and had a builder's yard in the West Road. Here he started his cement business. The kilns, however, became disagreeable to the inhabitants, and they were then removed to the present cement works in the Thaxted Road. The business developed, Mr. Dix was joined in partnership by Mr. Crafton Green and Mr. Ernest Green, and the works have since employed 40 men, and are turning out 5,000 tons of cement a year. Mr. Dix laid out Mount Pleasant Road, now the principal residential road in the town, and built several of the residences there. Artisans' dwellings were built by him for the working men of the town, and altogether he erected just over 100 houses there

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

CONTRACTS OPEN.

ERITH URBAN DISTRICT COUNCIL.
MUNICIPAL COTTAGES.
TO BUILDERS AND CONTRACTORS.

The Council invite TENDERS for the ERECTION of 48 COTTAGES in Brook Street, Belvedere, and for SUPERINTENDENT'S LODGE at the Erith Recreation Ground, The Avenue, Erith.

Plans and specifications may be seen, and forms of Tender and further particulars obtained, at the Office of the Surveyor of the Council, High Street, Erith, upon payment of £1, which will be returned upon receipt of a bonâ-fide Tender.

Tenders, endorsed "Tender for Cottages," must be sent to my Office not later than FOUR p.m. on MONDAY, the 1st OCTOBER, 1900.

The Council do not bind themselves to accept the lowest or any Tender.

The contractor will be required to enter into a contract and bond, with two sureties, for the due performance of the contract, and the contract will contain a provision that the contractor shall not sublet any portion of the works, under a penalty of £25.

CHAS. H. FRY,
Clerk of the Council.

District Council Offices,
High Street, Erith, Kent.

ST. ALBANS.

The Vicar and Churchwardens of St. Peter's, St. Albans, are prepared to receive TENDERS for ALTERATIONS to the PARISH HALL and the ERECTION of NEW SUNDAY SCHOOLS, &c., in Hatfield Road.

Plans, specification and form of contract can be seen and form of Tender obtained at the Office of the Architect, Mr. F. W. KINNEIR TARTE, 12 St. Peter Street, St. Albans.

Tenders, marked "Tender for Additions to Hall, &c.," and addressed to the Vicar of St. Peter's, St. Albans, to be sent in, in sealed envelopes, on or before the 4th OCTOBER next.

The lowest or any Tender will not necessarily be accepted.

September 1900.

TO BUILDERS.

The Guardians of the Parish of Willesden desire to receive TENDERS for the ERECTION of the NEW INFIRMARY, Acton Lane, Willesden.

Persons willing to Tender may obtain bills of quantities and a form of Tender, and inspect the specification and drawings any day between the hours of TEN a.m. and FOUR p.m. (Saturday till ONE p.m.), upon application to the Guardians' Architect, Mr. A. SAXON SNELL, F.R.I.B.A., of 22 Southampton Buildings, Chancery Lane, London, W.C., and depositing with him a £20 Bank of England note, which will be returned to persons sending bonâ-fide Tenders in the manner and at the time stipulated.

Quantities by Messrs. NORTHCROFT, SON and NEIGHBOUR.

Tenders must be signed, sealed, endorsed "Tender for Infirmary," addressed and delivered to me at my Offices not later than TWELVE o'clock noon on WEDNESDAY, OCTOBER 3rd, 1900.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order.
J. HUTTON HAYLOR,
Clerk to the Guardians.

Guardians' Offices,
No. 329 High Road, Kilburn, S.W.,
September 1900.

HORSHAM URBAN DISTRICT COUNCIL.
ELECTRICITY SUPPLY WORKS.
TO BUILDERS AND CONTRACTORS.

The Council invite TENDERS for the ERECTION and CONSTRUCTION of BUILDINGS for the proposed Electricity Supply Works.

Plans and specifications may be seen at the Offices of the Architects, Messrs. GORDON & GUNTON, Finsbury House, E.C.; or of Mr. W. C. C. HAWTAYNE, M.I.E.E., 9 Queen Street Place, E.C.; and also at the Office of the Clerk to the Council, Mr. S. MITCHELL, London Road, Horsham.

Bill of quantities, with terms and conditions, form of Tender and form of Contract, may be obtained from the Architects on payment of £2, which sum will be refunded on the return of the quantities filled up with a bonâ-fide Tender.

Sealed Tenders, endorsed "Tender for Buildings," must be delivered to me, at my Office aforesaid, not later than TWELVE o'clock at noon on THURSDAY, the 11th of OCTOBER, 1900.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
S. MITCHELL,
Clerk to the Council.

Horsham,
September 1900.

Can be fixed close up to Purchaser's boundary, and suits rise or fall in the ground.

TO BUILDERS and CONTRACTORS.

The Town Council of Gravesend invite TENDERS for the ERECTION of ADDITIONS and ALTERATIONS in extension of the Municipal Technical School, in accordance with plans and specifications prepared by Mr. EDMD. J. BENNETT, A.R.I.B.A., of 13 Gray's Inn Square, W.C., and 189 Parrock Street, Gravesend, from whom bills of quantities and form of Tender can be obtained by any applicant on payment of One Guinea, returnable on receipt of a bonâ-fide Tender from the applicant.

Plans, specification, and form of contract, conditions, and bond can be seen at the Municipal Technical School.

Tenders, endorsed "Technical Tender," must be delivered at my Office, Court House, Gravesend, before NOON on MONDAY, 8th OCTOBER, 1900.

The Council do not bind themselves to accept the lowest or any Tender.

CHAS. E. HATTEN,
Town Clerk.

DOVER PROMENADE PIER.

The Dover Promenade Pier and Pavilion Company, Limited, invite TENDERS from Contractors for STRENGTHENING PIER HEAD and the ERECTION of a PAVILION,

in accordance with plans, specification, and bills of quantities prepared by their Engineers, Mr. M. NOEL RIDLEY, Assoc.M.Inst.C.E., 11 Dartmouth Street, Queen Anne's Gate, and Mr. ROBERT J. BEALE, A.R.I.B.A., Broadway House, Westminster.

The plans and specification may be seen at the Engineer's Offices, No. 11 Dartmouth Street, Westminster, between the hours of TEN and FIVE, and bills of quantities obtained on payment of £2 2s., which sum will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, on the form supplied, to be delivered to the undersigned on or before the 9th day of OCTOBER, 1900, endorsed

"Tender for Pavilion, &c."

The Company do not bind themselves to accept the lowest or any Tender.

ERNEST ARDLIE MARSH,
Secretary.

Pier Company's Office,
Marine Parade, Dover.

RURAL DISTRICT COUNCIL OF NEWHAVEN UNION.

ROTTINGDEAN DRAINAGE.

The Rural District Council of Newhaven Union invite TENDERS for the LAYING of about 2,490 feet run of 12-inch and 9-inch STONEWARE PIPE SEWERS, with Manholes, Lampholes, and other contingent works, at Rottingdean.

Plans, sections, detail drawings, and specification may be inspected and forms of Tender and bills of quantities and further information obtained at the office of the Engineer, Mr. THOMAS WM. FRANKS, A.M.I.C.E., Seveirg Buildings, Lewes, between the hours of NINE and TWELVE o'clock a.m. upon payment of a deposit of Three Guineas, which sum will be retained by the Council and deemed to be forfeited if a bonâ-fide Tender is not made in the proper form by the depositor. If a Tender is made which is not accepted the deposit will be returned, and if a Tender is accepted such sum will be retained by the Council until the contract has been executed by the depositor and will be forfeited if the contract be not executed within seven days after notice has been given to that effect.

Sealed Tenders (which must be on the form supplied) to be sent to the undersigned Clerk to the Council on or before THURSDAY, the 4th day of OCTOBER next, endorsed "Rottingdean Drainage."

The Council do not bind themselves to accept the lowest or any Tender.

Security will be required for the due performance of the contract.

By Order,
WILLIAM GATES,
Clerk to the Council.

No. 86 High Street, Lewes,
September 1900.

TO IRON FENCE MANUFACTURERS and OTHERS.

The London County Council is prepared to receive TENDERS for WROUGHT-IRON HURDLES, to be delivered at the various Parks and Open Spaces.

Persons desiring to submit Tenders may inspect the drawings, and obtain the specifications, form of Tender, and other particulars, at the Parks Department, 11 Regent Street, S.W.

Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with.

The contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in, and form part of, the contract by way of schedule.

Tenders are to be delivered at the County Hall in a sealed cover, addressed to the Clerk of the London County Council, and marked "Tender for Iron Hurdles."

No Tender will be received after TEN a.m. on FRIDAY, the 5th day of OCTOBER, 1900.

Any Tender which does not comply with the printed instructions for Tender may be rejected.

The Council does not bind itself to accept the lowest or any Tender, and it will not accept the Tender of any person or firm who shall on any previous occasion have withdrawn a Tender after the same has been opened, unless the reasons for the withdrawal were satisfactory to the Council.

C. J. STEWART,
Clerk of the Council.

Spring Gardens, S.W.,

An Architectural Causerie.

Windows: Sash or Casement.

One of the reactions of our day, so fond of change yet often looking back, is that which has substituted casements for sash windows in so many designs of private houses. The sash window was introduced into England in the seventeenth century from Holland, and immediately became popular, its convenience in enabling people to open "a crack" at the upper or lower part for the ventilation of a room being unmistakeable. This was before the days of plate glass, though diamond panes were being disused. A window from without presented the appearance of a number of squares: these, as glass-making improved, were made larger, until in our own time plate glass was introduced and many large windows were fitted with it, the frames at the same time being changed to mahogany. But many London drawing-rooms remained fitted with casements opening to a balcony, a very pleasant arrangement which in summer practically increased the size of the room. It is rare, however, in England to find architectural effect, in a matter of this kind, studied as it is abroad; consequently the casement presents the appearance of a single line of some light colour against the glass. On the Continent the effect is that of a long cross, which is better, and suggests the idea of support and continuation—in fact, of a mullion and transom. Sometimes a compromise is made by using the sash for small windows and the casement for large ones. In the designs of the last few years the casement figures largely, for the mullioned window has been revived and its "lights" are too small for a comfortable use of the sash system. In the suburbs the new villas are rarely provided with as good a "French window"—a misnomer, by the by, for the sash is essentially Dutch—opening upon the lawn as such houses universally possessed forty years ago. The lawn itself has shrunk to something little better than a backyard or disappeared altogether, and this, too, in roads of high-rented houses. Land is dearer, hence the restricted garden; time is spent at the theatre or away on a bicycle, and less at home, and the suburban garden is thought less important. In blocks of flats there is little opportunity for this, the most pleasant feature of suburban life, and in the newest of these "Mansions" the sash is usually retained. On the whole, a compromise is the best solution of the window question; a garden or a genuine balcony—a balcony for use—is best approached by a large French window, but the sash will probably hold its own for bedrooms and offices. Its disadvantage, regarded from without, is that it introduces too many hard horizontal lines into the picture as we look at the house. J. C. P.

Evening Studies for the Coming Winter.

The winter evenings are fast approaching, and it will therefore be well to make a few remarks about arranging a scheme of study for them. It is not, as it was a comparatively few years ago, a matter of adopting an indifferent scheme because it was the only one brought before the student's notice, but of selection between many, each of which is excellently devised, and even of developing a scheme of one's own. To insist strenuously upon the necessity for supplementing the ordinary daily office experience with evening study of some sort is no longer so essential as is guidance of that study upon proper lines, the necessity of which is universally acknowledged. Nor is this an altogether easy task. Owing to the multiplicity of opportunities, the tendency is to undertake too much, with the natural result that many students who are full of energy in October are fagged out and brain-weary before the following April. Two hours each evening for four evenings in the week is as much in the way of direct study as the majority of young men can stand for a protracted period, taken in addition to the ordinary work of an office, it being well that the remainder of any spare time should be given up to athletic, and preferably outdoor, exercise of a moderate character. Within this limit the brain can be trusted to do its full work, and to do it continuously, without ill effect to the worker, accomplishing much more in the course of an entire winter than if over-driven. So, too, with the selection of the subjects to be studied; and in this respect it should not be forgotten that the elements present as great difficulties to the beginner as do the most abstruse problems to the accomplished student. Thus both are to a great extent in the same position. Neither should scatter his energies over too wide a field, or he will feel he is making, and in fact will make, but little progress; while on the other hand neither should concentrate his energies entirely upon one field, or he will run the risk of becoming "stale." Two subjects at least should be taken up, which, while correlated, should on the whole make drafts upon a different set of brain cells; one, for instance, such as design, calling upon the imagination, and the other, the science of construction, with its closely reasoned arguments. To many it is possible to concurrently follow a third connected subject with success, but it is given to few to do more than this. Youthful students in particular are inclined to scatter where they ought to concentrate, and as it pays the teacher best, in schools which depend upon Government grants, for elementary students to obtain many moderate successes, there is a tendency to discourage proper concentration amongst many of them. Older men, of more settled character, can almost invariably concentrate more, and can even, for a considerable time, devote themselves to one branch of study only without material damage, but presently the brain will feel the overstrain. With them, success and distinction may seem to be great prizes, but they may be very dearly bought. Thus one may say that the younger student as a rule lacks concentration—the older, decentralisation; while each should aim at reasonable variation combined with persistence.

G. A. T. M.

ALL SAINTS' CHURCH, PAVEMENT, YORK. DRAWN BY C. G. HARPER.

Two Notable Churches.

That the fine church of St. Dunstan's-in-the-West, the chief ornament of Fleet Street, is being defaced by the present building of insurance offices over the westward one of its two forecourts is a scandal and a disaster; and none the less may we deplore the fact from the church itself being modern, and a copy at that. It was a piece of indefensibly bad policy that led the Consistory Court to sanction the sale of this strip of paved court to a commercial body for building upon, thus sacrificing the balance of architectural composition of which Shaw, the architect of the church, was the author, about seventy years ago. St. Dunstan's-in-the-West, so-called to distinguish it from that other St. Dunstan—St. Dunstan's-in-the-East, off Lower Thames Street—was built towards the close of William IV.'s reign, and replaced a curious building that projected beyond the normal building line of Fleet Street and had for the chief ornament of its somewhat debased exterior a bracketed clock furnished with the figures of two giants in an alcove,

which struck the hours and the quarters with clubs upon a bell. That clock and the "Giants of St. Dunstan," as they were called, were purchased by the Marquis of Hertford and erected at his villa of St. Dunstan's in Regent's Park, now the residence of Lord Aldenham, where they still remain. The present church, which replaced the vanished edifice, is remarkably good in general effect and in detail for the period in which it was built. This is owing, doubtless, to the direct inspiration which Shaw took from the ancient church of All Saints', Pavement, in the city of York, of whose beautiful open octagonal lantern tower that of St. Dunstan's is a copy. How close

ST. DUNSTAN'S-IN-THE-WEST, FLEET ST., E.C.

the copy will be noted by those familiar with the London church on glancing at the illustrations herewith. Its situation renders the copy even more effective than the York original, whose lofty pinnacles lose something from the crowded part of York in which the Pavement lies. Built away back in the Perpendicular period, the lantern-tower of this original was raised for a purpose other than that of ornament, being indeed designed to carry a lighted beacon that should guide strayed travellers across the wild uncharted country into York in times when dense woodlands—the ancient Forest of Galtres—stretched northwards for fully fifteen miles.

St. Dunstan's has never lacked admirers. Many years ago the tower was chosen by Clarkson Stanfield as a central object in one of his well-known illustrations to Dickens's Christmas story "The Chimes." The interior of the church is disappointing after the promise of the exterior. The more than life-sized statue of Queen Elizabeth that stands in an alcove in the eastern courtyard came from the long-vanished Lud Gate.

C. G. H.

On Reflection.

Electric Trams in Ruskin Country. SEVERAL references have already been made in our columns to the system of electrical tramways which the British Electrical Traction Company proposes to introduce into the Lake District. Much local opposition has been encountered, and the scheme was strongly condemned by the National Trust for Places of Historic Interest or Natural Beauty: eventually it was withdrawn, but the managing director of the company now comes forward and explains why it was withdrawn, at the same time stating his side of the question. The withdrawal, he says, was necessary because the local authorities required alterations which could not be carried out by any modification of the order applied for, making a new order essential. He appreciates the fact that the residents desire to maintain their seclusion in a beautiful piece of country, but, according to his view, this is no reason why "the much larger number of people who are unable to afford to pay the heavy fares charged by the coaches in the district should be excluded from it." He is of course quite correct when he maintains that the Lake District is not the exclusive property of the few who reside in it; but many will differ from him when he asserts that the argument that electrical tramways would spoil the district for everyone is quite inconsistent with the other argument, that the tramways will bring a large number of persons into the district. This is all very well, but past experience of the introduction of railways into spots of great natural beauty is sufficient to desire the discontinuance of such a practice. There are towns enough spread over the district in question, which are already connected with the railway, thus making them excellent centres from which to make excursions. One can understand and appreciate a scheme by which some country or object of interest is brought, by means of a railway, into touch with the population who would wish to visit it; but why, in a case like the one under notice, run lines all over the district, for this would probably be the final outcome of the present scheme? Railways, though they are now indispensable, always spoil, more or less, whatever beautiful country they pass over, and they are therefore only defensible on the grounds of utility and facility of intercommunication. If, in the interests of the commerce of to-day, a railway becomes an essential, then there is nothing to do but to construct one; but it appears to us that in the Lake District conditions are different, and there is no necessity for the proposed tramways. If these would not deface the country no objection would be made to their introduction; but the fact being otherwise, they should be opposed. If, as is stated, the coach fares are too heavy, then let new coaches be introduced, with charges reduced to whatever is considered reasonable. A coach is a movable object, and, because of its horses, is generally a beautiful one; lines of rails and cast-iron standards with arms are fixtures, and become part of the landscape, with displeasing results.

Tintern Abbey. THE statement was circulated at the beginning of last week that the famous Cistercian Abbey at Tintern had been purchased by the Government, and had so become the property of the nation: later, the Central News announced that all this was premature, the contract not having been settled, much less signed; but the purchase, by the Commissioners of Woods and Forests, has since been confirmed. The grand old abbey was on sale for a long time, for it formed part of the Duke of Beaufort's Monmouthshire Estate, which was placed on auction more than two years ago. When it became known that Tintern Abbey ran a risk of becoming the property of someone who might treat it largely as an income-producing investment, the Monmouthshire County Council appointed a committee to enquire into the matter, with a view to purchase, but we believe nothing came of this. The National Trust for Places of Historic Interest or Natural Beauty was also looked to for help, and the rumour went round that an American proposed to acquire the abbey, take it down stone by stone, and re-erect it in his own country: such, however, was an old wives' tale. As to the revenue derived from the admission fees, it may be mentioned that Tintern produces between £700 and £800 a year, while Raglan Castle, also part of the Beaufort property, brings in £500. Tintern Abbey has already been the subject of much description, study, and eulogy, and there is therefore no need to discourse here on its beauties. It is sufficient to say that it belongs to that Geometrical Gothic within the limits of which, as Mr. Prior says, "are to be grouped our most perfect buildings, as well as our most consummate sculpture." With such a building as Tintern Abbey for our heritage, it behoves us to be blameless in our care of it. Let us hope that in the hands of the Government it will be well looked after: there should be no chance for such spoliation as at St. Alban's, or such adaptation to commercial ends as that so deplorably carried out at the Fall of Foyers: still there is the new guard-house at the Tower to remind us of the fact that even Governmental authorities can commit gross vandalism.

London Bridge. THE problem of accommodating the immense streams of traffic that now pass through London's streets is becoming yearly more difficult. Widenings have been made at certain parts which have afforded some slight relief—such, for instance, as that at the Oxford Street end of Tottenham Court Road—but much more comprehensive schemes are needed, schemes like the one which has effected such a splendid widening of the Strand between the two churches. The streets being thus crowded it necessarily follows that those bridges which form part of the main thoroughfares also become choked with traffic, and nowhere is this so apparent as on London Bridge. This is no new discovery. The matter has been under anxious notice for many years past, and it was with the object of relieving the congestion on Rennie's excellent bridge that the Tower Bridge was built. But, unfortunately, this latter bridge has not proved of much use on account of the unsatisfactory state of its approaches on both sides of the river; and until these are widened and is a direct means of communication afforded from St. George's Church in the Borough, so as to enable the dock traffic to be diverted at this point, there will be no improvement. The bridge to the west of London Bridge—Southwark Bridge—is likewise of little use, though it cost £800,000. The reason for this is again largely on account of the unsuitability of its approaches, besides which the gradient on the Cannon Street side is considerable, causing great strain on horses pulling heavy vans. As to London Bridge itself, there is no lack of proposals. As far back as 1876 Parliamentary plans were deposited for a widening scheme, this one proposing to erect at each side a light suspension bridge for pedestrians, thus leaving the whole of the bridge free for vehicular traffic. Schemes of this kind would be disastrous to the appearance of the bridge, and should be condemned. London Bridge (which cost £1,458,311) and Waterloo Bridge are the most beautiful that now span the Thames, and if any widening schemes are carried out on them they will be spoilt. Widened approaches or new bridges are what is wanted.

Warlingham Church, Surrey.

BY J. RUSSELL LARKBY.

A smiling well-wooded plain, a secluded church nestling under the great churchyard yews, swift-flying swallows and the reiterated note of the cuckoo, and one has a mind-picture of Warlingham Church on a perfect spring day. What a valuable lesson these village churches are ready to teach us if we only approach them in the right way! The highest and best thoughts of man are centred on one Sacrament—one Sacrament ever new and fresh, yet naming its age by centuries, and the source of all that is good and beautiful in man's conception of the Temple of God. We have right cause to be thankful that there are left to us these sweet and lasting memorials of earnest hearts and loving hands.

Architecturally, the church is by no means imposing, either externally or internally, and the absence of a chancel arch detracts greatly from its appearance. Some holes in the north and south walls of the chancel would seem to suggest a screen, and one can well imagine the restful effect of such a feature; such as the screen at Kemsing, in Kent, for instance. The tracery of the Decorated east window has been restored, but it retains its original interior hood mould and side shafts (see Fig. 1). There are no base mouldings, and the slender shaft is attached to the chamfer in the manner common to the style.

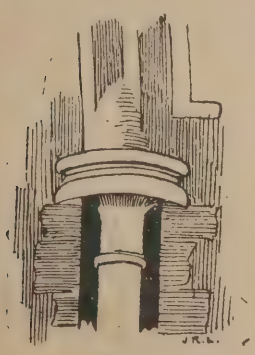

FIG. 1.

In the north and south walls respectively are two elongated Early English lancets and a two-light Perpendicular window, that on the south side having been recently restored. The rere arches of the lancets are slightly moulded, as shown in Fig. 2. The south wall has also a priest's door, the outer surface of which has been restored. West of this, and almost touching it, is a fine specimen of those peculiar openings known as low side windows. Sketches of both internal and external details are given in Figs. 3 and 4. The outer face of the opening has been restored, but presumably according to the original form, as I believe the work was placed in the hands of Mr. Johnston. Mr. Johnston is a great champion of the "confessional" theory of these mysterious openings, and he stoutly maintains that this *is* without doubt a confessional window. How far he is correct has, of course, yet to be proved, but this example does not seem to be particularly well adapted for the purpose claimed. From the bottom of the window to the present ground line (and something must be allowed for earth accumulation) the distance is 5ft. 3in. The proper and only position for a penitent is obviously to kneel to the priest, and how impossible this would be in the Warlingham example is obvious to all, although Mr. Johnston gets over the difficulty by placing the penitent on a stool.

Fig. 4 gives the interior detail and shows a peculiar semi-circular recess, which "confessional" champions claim to be where the priest stood to absolve the penitent. One is very much tempted to ask these gentlemen why the penitent should not be allowed to make his confession inside the church, and if he *must* confess through the wall, why it should be necessary to construct the opening 5ft. from the ground, which, without the aforesaid stool, is an impossible height for any person to kneel and confess to a priest inside.

The "confessional" theory, except in some quarters, and be it said competent quarters, is wellnigh *in extremis*, and it is to be hoped that in a short time it will entirely disappear, like the absurd "leper" explanation. Without, of course, expressing any decided opinion in so

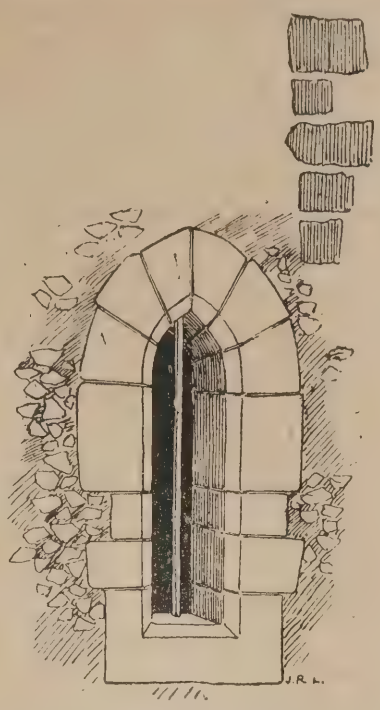

FIG. 3.—OUTSIDE OF LOW SIDE WINDOW, WARLINGHAM.

doubtful a matter, most antiquaries are inclined to give more than ordinary attention to the theory started by Mr. Pointing, and ably defended by Mr. St. John Hope, that these openings were for the ringing of the Sanctus bell during mass. Much has been said on both sides of the question, but it is a noteworthy fact that at Warlingham, as at Goodmanham and Holme (Yorks), and many other places, the windows open out towards the village. Sometimes, as at Holme, the village is on both sides of the church, consequently there are two low side windows. Now it is not likely that in any ordinary village church there would be so many penitents as to require the use of *two* confessional holes.

Ancient drawings of the confessional are by no means uncommon. Dr. Legg has published one in his "Churchman's Almanack," where the penitent is shown kneeling to the priest, who is seated in a kind of recess—certainly in the interior of the church. Another important example may be cited. On one of the seven panels of the sacrament font at Farningham it is interesting to note that, in the confessional group, the penitent again kneels to the priest, who is seated as in the drawing published by Dr. Legg. If these windows were in at all general use for the confessional (and they are found of nearly all styles), it is, I imagine, only to be expected that some mention would be made of them by religious writers, and if only a contemporary representation of their use for confession could be discovered, then indeed the hearts of the champions would have right cause to be glad; but, if my memory serves me correctly, I have neither record of any such picture, nor indeed any literary support that they were ever used for the Sacrament of Confession.

Eastwards from this low side window is to be seen a perpendicular line of ashlar, also seen in the sketch of the exterior of the chancel at Fig. 5. From this it seems that the chancel was lengthened about 20ft. at some time not long after the erection of the church, as nearly all the features of the chancel are Early English, with a little Decorated work in the east wall, which would perhaps tend to show that some further structural alterations were carried out in early Decorated times. More direct evidence of this is, however, to be seen in the south wall of the chancel, which has two separate sets of sedilia, with a piscina attached in both cases. In both instances the sedile is round headed, and the piscina pointed and trefoiled. It may be suggested that when the conjectured alterations were made it was thought better to leave the old and westernmost sedile and piscina and to construct similar ones near the new position of the altar.

On the north side of the nave is a large wall painting, roughly executed, of St. Christopher carrying the infant Christ across the stream; the painting, however, is now much faded. The font, near the west door, is octagonal and Perpendicular in style, each face bearing a representative, roughly cut, quatrefoil. On the eastern face the points of the cusp meet in a grotesque head. The whole shows some traces of colour—and scraping.

I entered Warlingham church as quite a stranger, but I left it with a contented mind, glad that to the antiquary there is often something in the quietness of the village church which one does not get in the vastness of the cathedral. Everything here is on such a small scale that all the details can be grasped in an hour or two, and at a second visit the place is like an old friend, and another church to be visited periodically with both profit and pleasure.

The only Statue of a Nun on a public monument in North America is the bronze portrait statue of Jeanne Mance, the first Sister of Charity who landed in North America. The statue is of colossal size, and is in the Place d'Armes, Montreal. She is represented dressing the wounds of an Indian.

FIG. 4.—INTERIOR OF LOW SIDE WINDOW, WARLINGHAM.

DECORATION AND FURNISHING.

III.

By FRANK MURRAY.

(*Concluded from page* 126, No. CCXCIII.)

IT is a little puzzling to know from what point of view one should regard furniture as a motive for a paper within the scope of this journal. To the general reader one would say, there is nothing easier than to buy it, except to buy bad. Every need of shape, size, and special use has been designed and re-designed in time-honoured and often monstrous forms. The subject lends itself so well to picturesque illustration that a book on furniture has come to be one of the reserve battalions of the art publisher. The catalogues of the large furnishing and decorating firms—which, by the way, can be taken quite seriously as books, many of them being exceedingly fine examples of printing and illustration—enable anyone to be cheaply or extravagantly vulgar in an armchair at home, secure from the seductive commonplaces of "art" furniture salesmen. But advice to the professional reader is a weightier matter.

Since the era that we flatter ourselves by naming that of the revival of the arts, the design of furniture has engaged the labours of many well-intentioned and capable men. Their efforts, however painstaking and earnest, suggest little beside painful reflections. Up to the end of the eighteenth century, style in the design of articles of domestic use shared the fortunes of the other handmaid arts of daily life. It would not flavour of exaggeration to affirm that it is hard to find many really bad examples of design in the whole of the ages preceding the close of that period. When, however, we come to look at the time of the so-called revival of the arts, to consider critically the efforts of men who attempted to piece together the broken strands of artistic tradition, one feels that silence is the best and only possible criticism to offer. Their aims and enthusiasms command our respect; beyond this there is nothing to be said.

The subject of original design in furniture will engage attention later on; at present it will be best to confine ourselves to the consideration of the examples of already designed work of typical styles.

Great secular alterations in the habits of life among the centres of population, especially in the wealthier classes, have demanded a corresponding adjustment of the forms of articles in daily domestic use through all ages, but it is only within the last two centuries that such a radical alteration has taken place as to necessitate a complete readjustment of form and use to the altered conditions obtaining.

It must be noted here, in these brief hints, that we are not taking into account the furniture of Oriental nations, whose habits of life, widely differing from our own, have remained practically unchanged for many centuries.

Though we may borrow many useful hints from earlier times, the great storehouse of style, form, and artistic fitness in design will be found in the examples of the sixteenth, seventeenth and eighteenth centuries. The work left us by these, the golden ages of design, is beyond praise, and the most helpful advice I can tender is to exhort readers to make use of the poor remainder of these that time has left us. A few hours spent in the Furniture Section of the South Kensington Museum galleries would do more to establishing a sound understanding and appreciation of the principles of design in the furniture arts than volumes of the most artistically printed denunciation and exhortation.

Let me now direct the attention of my readers to certain

Main Considerations

which affect the question of style and design in general. To put the matter as pithily as possible in the beginning, I would say: Do not in any case be a slave to formalism in style. One might parody the well-known proverb, and say "Style is a good servant, but a bad master." It does not resemble a crystallised inorganic thing, but a vital living creature. The very essence of style is character, and that is in itself simply a departure from the normal standard. It is to be hoped we have seen the last of those mechanical formalisms—houses built, decorated, and furnished throughout in one particular style. The house, its decorations and its furniture, should show symptoms of growth and development; a ready adjustment of convention to the increasing needs of daily life; a respect for old artistic traditions; a warm welcome to any new vital development in art. All these things are poles asunder from the inert formalism which results from a pedantic adherence to rigid style.

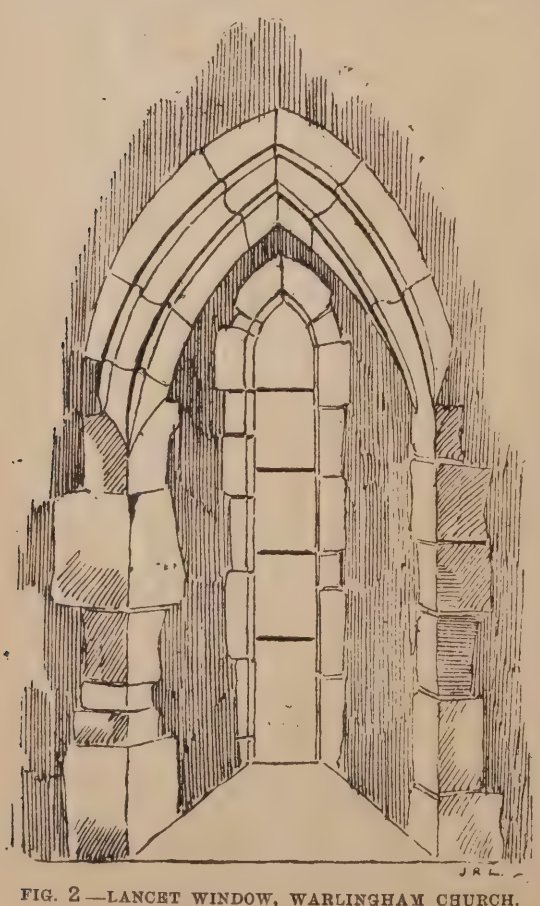

FIG. 2.—LANCET WINDOW, WARLINGHAM CHURCH.

In the selecting and placing of furniture more regard should be had to function than to style. The types afforded by two centuries of design may be very fittingly found in the same apartment. The beginning and the end of a century agree to peacefully and artistically differ; but to have pianos or umbrella stands masquerading in Græco-Roman or mediæval costume is an unforgiveable offence. It must be remembered that nearly all articles of modern use are inseparably connected with defined styles of the later periods. These marked accents must never be forgotten. The folding-top escritoire, the china cabinet, the settee, the banner screen, the card table, all suggest, more or less vividly, the gracious, quaint, and kindly period of the eighteenth century, and these delightful images should not be sacrificed on the altar of a mechanical precision in style. One very

Great Defect

of to-day is over-furnishing. It is certainly true that ninety-five houses out of a hundred are made vulgar, ugly and uncomfortable by over-furnishing: for this there is simply no remedy at all; "you cannot make a silk purse out of a sow's ear," but you can at least take great care that in advising, selecting or planning you err on the side of simplicity and reticence. We must be prepared often to find our most cherished efforts spoiled after they have left the designer's hands; no one can guarantee against misuse, and the meretricious instinct of

FIG. 5.—CHANCEL, WARLINGHAM CHURCH.

the tribes that inhabit and artistically defile their houses is too strong for the artist to control. We may, however, satisfy our conscience by leaving the chambers swept clean and garnished for the seven women who will probably enter in with antimacassars, cheap pottery, and painted tambourines.

One of the most quaintly interesting cases of the diseased tendency to over-furnish is that of the familiar drawing-room cabinet. What social law or convenience has declared statutorily for a cabinet in the drawing-room is unknown; no one ever seems to reflect whether there are any objects that want "cabineting," which are commonly bought afterwards to fit the cabinet, but all considerations of space and comfort would count for nothing if they involved the sacrifice of the cabinet fetish.

There is one section of furniture that presents special difficulties. Sofas, easy chairs, and heavily stuffed furniture are, and always will be, a main source of trouble. It is not that there are no types of perfectly good artistic form fitting for all the reasonable needs of all reasonable people, but fashion has introduced a host of forms which, christened with vulgar and inappropriate names, should only go to increase the bulk of the art furnisher's catalogue.

There is one rule as to form in regard to all heavily stuffed or padded furniture by adhering to which there is no reason why these objects should present any rampant artistic improprieties. Let the form be simple, the curves flat, avoid elaborate and lumpy trimming—striped materials are very good for the purpose of covering; they accentuate the formal lines, and, with well stuffed furniture, give exceedingly graceful flat curves. In this matter of upholstery (an unhappy word, but a well understood one), we may regard from about 1660 to 1760 as the best age for the upholsterer, and the discriminating way in which heavy padding and stuffing was modelled into quaint and almost beautiful shapes will provoke an artist's unbounded admiration. It will be well to notice here that in dealing with styles anterior to the year 1600, going back even so far as Græco-Roman times, stuffed work was very rarely fixed to a frame; the cushions or padding were made separately in the form of squabs and placed loosely in position or secured by straps and bands.

Hangings.

Stuffed furniture leads one naturally to the consideration of draperies, and, at the risk of being a little out of place, I will give a word or two here on the subject. There is not much to say, but it ought to be said very strongly. It is not needful to particularise; I would only ask all and singular to make a clean sweep of the upholsterers' works and renounce them. The one line to take in respect of the arrangement and shapings of window hangings and draperies is simplicity, and simplicity, and again simplicity; and this without regard to the richness or elaborateness of the decoration you are dealing with. Let your materials be as costly or as inexpensive as you like, it matters nothing whatever; keep the forms severe, the fringes restrained, the lines of draping vertical, or nearly so, no heavy loopings, a plain or very slightly shaped head band, no elaborateness of curtain poles; if a cornice be a necessity return the cornice of the room to form the required headpiece for the window hangings. Good style in hangings is not a feature after the middle of the eighteenth century; the draperies

later than that epoch were very conventional and affected in treatment; like many other things, the hangings came to be mere decorations and lost all semblance of use. The true beauty of draping was confused in an affected jumble of forms. The modern window curtain, not intended to draw, but simply a supposed ornamentation, represents the final degradation in style which began about the year 1760.

In considering the furnishing of public rooms and halls, one cannot afford to treat the continuity of style with the same freedom as in the case of a private residence. At the same time, even in these cases, a certain insipidity is the accompaniment of too great pedantry and precision in style.

Passing now to the consideration of independent or original design in furniture, the remarks contained in these columns are given as advice or guide to those to whom the subject of furniture has not appealed directly in the way of professional work, and I would say, very strongly, that original design in furniture should not be attempted by an amateur or beginner. Edged tools are proverbially dangerous playthings, and rules for the design of furniture are more than likely to result in the greatest misery to the greatest number; that is to say, those who use the articles after they have been made. There is one perfectly safe piece of advice that can be given, with a strong probability that it will rarely be followed, and that is: In designing, think first of convenience and comfort in use; sacrifice everything to these primal necessities. It is a little humorous to find that many of the most interesting, artistic and delightful pieces of furniture have been designed without any apparent regard to the above advice; nevertheless, I feel bound to urge it, even if it only come to be regarded as a piece of copy-book morality.

The Besetting Sin

of those who attempt design without a long course of drill in the mechanical elements of constructive fitness and proportion is a contempt for all previous essays in design; nothing less than a new style will satisfy, and what that means in unpractised hands, the tame, tasteless abortions we are being taught to call the new style are a satisfying evidence of.

There is plenty of room for individuality and scope for freshness of treatment in the natural development of the historic styles. The great designers of the past wasted no thought on the invention of fresh tongues in which to express their ideal, and I think there is little fault to be found with the greater part of the work they have left us.

If I add anything to these general lines of advice it would be to say, avoid any form of affectation; be simple and straightforward; a piece of furniture should serve its ends unobtrusively and be as lovely as its uses will permit. In the greater number of cases need will only allow of a quaintness of form or harmony in proportion; beauty of texture or colour can be had to make amends for these limitations, and in the interest of grain or lustre of colour and sheen of surface, the simplest piece of furniture may worthily find its place among the masterpieces of the greater arts.

It will be well to bear in mind also that the greater the richness and elaboration in furniture, the more risk of inappropriate, and therefore bad, design. In the nature of things an object intended for everyday use and handling is unfitted for the display of rich and elaborate detail. There is always a certain sense of unfitness even in pieces with an especial decorative purpose, where some latitude might be supposed, and the experience is universal that what might be called show pieces are fatiguing and unsatisfactory to the sense.

Great reticence must be observed in ornament, whether carved, painted or inlaid. On the other hand, there is wide scope for the most enchanting effects by the use of varied textures, woods and other materials, such as tortoise-shell, bone, pearl, &c.

The most fruitful field for the expression of character and development of style will be found in the use and design of mouldings and moulded surfaces. The simplest and most ordinary of things will attain by means of fine mouldings a stamp of individuality and family, if one may use the word, a breeding. In a crowd of indifferent examples one such will preserve its rank and irresistibly attract.

The foregoing remarks apply more directly to what is understood as "furniture" in common speech, but with certain deductions the same may be held to apply to the whole of the fittings of a house. The word "furniture" may very reasonably be used as a distinctive for all fittings for domestic use; this would bring the apparatus for lighting, heating, &c., into the category, but in my remarks hitherto I have been more particularly referring to the three great classes into which what is commonly understood as "furniture" can be divided. These may be very briefly classified as—things to sit at, things to sit upon, and things to put other things in or upon; in brief, the table, the cupboard or sideboard, and the chair or settee. But outside of these limits there are very many articles of daily use which quite reasonably and legitimately can be held to come within the limits of "furniture" properly so-called. In many of these the art of design is in a sounder state than the criticism on the principal classes implied. This is undoubtedly the case with metal work, and to a great extent with wall materials, such as paper and stuffs. Carpets, except in the case of Oriental design, are not a great deal better off than chairs and tables; but still there are some examples which seem to show that the art of design has never fallen quite so low as these, and has had a fairer chance of healthy growth.

It may not be amiss to suggest that a great field for interesting and truly artistic work remains in the treatment of combinations of woods. The practical difficulties in the use of many woods of exceedingly fine colour and texture, except in very small pieces, limits one's field of action to a certain few well-seasoned veterans, at least for the principal constructive parts; but even of these the field is widening year by year, and with the incoming of new and improved methods of seasoning, a great many fine colonial woods may be added to our stock of reliable constructive ones.

I have already overpassed the limits of my space, and there still remain to treat many interesting side issues in the great artistic question of furniture, notably metal work, hinges, lock-plates, fastenings of all kinds, both for purely decorative purposes and decoration combined with use. I can only indicate those fields of design, and may possibly return to the subject at a future date. It remains to plead to my readers for a favourable construction of the suggestions which I have ventured to put forward.

A Memorial Screen and stained-glass window has been erected in St. John's Church, Newcastle.

A Stained-glass Window in Seamer Parish Church is to be erected as a memorial to the late Earl of Londesborough from the Seamer tenantry. The order for the window has already been placed in the hands of Messrs. Burlison and Gryll, of Sheffield.

Arley Chapel Clock, Bristol, has been reconstructed by Messrs. W. W. Kemp and Co., of Stoke's Croft. The old freestone dials of this ancient landmark have been taken out and replaced with cast-iron skeleton ones (five feet in diameter) glazed with white opals, which at night are brilliantly illuminated. The works of the clock have been entirely reconstructed, all the old worn-out wheels and bearings having been replaced with new ones of gun metal. The removing of the massive freestone dials has necessitated considerable labour, and new mechanism to the four sets of works which carry the hands. Messrs. Kemp have also made and fitted to the clock an automatic arrangement for turning on the light at dusk and turning it off at 11 o'clock. The weather vane on the top of the tower, which has been stationary for a very long time, has been taken down, redecorated, and the obsolete fittings replaced by new.

GREAT FIRES.

FIRE has always been one of the great destructors of man's handiwork, but the immensity of the damage done can hardly be determined. The following figures, however, show what enormous catastrophes have occurred through fires.

London was nearly destroyed by fire in 798; again in 982, 1212, and 1666. The last fire is known in history as the "Great Fire"; it burned over a territory of 436 acres, including 400 streets; 13,200 buildings and property valued at about £10,000,000 were destroyed. Edinburgh was nearly destroyed by fire in 1700. Lisbon was burned in 1707. Venice was destroyed by fire in 1106 and again in 1577. Berlin was destroyed in 1405. Berne in 1634, and again in 1680. Hamburg was nearly destroyed by fire in 1842; 4,219 buildings were burned, and 100 persons lost their lives; £7,000,000 worth of property was destroyed. Copenhagen was burned in 1728; 1,650 houses destroyed; again in 1795, and 1,563 houses burned. Stockholm in 1751, with 1,000 houses destroyed. Moscow in 1752, visited by a large fire; 18,000 houses destroyed. Again in 1812; this time the fire started by Russians in order to prevent the French occupation of the city; 38,000 houses were destroyed, and more than £30,000,000 of value.

Constantinople has been the scene of numerous and costly fires. In 1729 a great fire destroyed 12,000 buildings and nearly 6,000 persons. In 1745 another great fire lasted five days; again in January, 1750, 10,000 buildings destroyed. In April, the same year, another fire, with £3,000,000 worth of property destroyed. Again, later in the year, a fire destroyed 10,000 houses; in 1756, 15,000 houses were destroyed and 100 lives lost. In 1782, 10,000 houses were burned; in 1791, between March and July, serious fires destroyed 32,000 houses, and nearly as many were destroyed again in 1798. In 1816, 12,000 houses and 3,000 shops were destroyed. In 1870 Pera, a suburb of Constantinople, was nearly destroyed, 7,000 buildings and property valued at £5,000,000 being consumed.

Smyrna had great fires in 1763, 1792, and 1841, destroying between 2,000 and 12,000 buildings at each fire. Great fires have occurred in India, China, and Japan; in many cases large cities were entirely destroyed. In Quebec, in 1845, 1,650 buildings were destroyed and the same number in May and June following; and in 1866, 2,500 buildings and seventeen churches were destroyed. At St. John, N.B., 1837, nearly all the business portion was destroyed. In 1877 the "great fire," more than 200 acres burned, and ten miles of street. St. John's, Newfoundland, was nearly destroyed in 1846, and £10,000,000 worth of property was burned; again a big fire in 1896. Montreal in 1850 had a great fire; 250 buildings destroyed; in 1852 about 1,200 buildings were destroyed. Various cities in South America and West Indies have been destroyed by fire. A large loss of life resulted also.

The United States has a record of destruction of property by fire not equalled by any other country. Charlestown, Mass., in 1796, £60,000; in 1838, 1,158 buildings. Savannah, Ga., in 1820, 463 buildings and £80,000 value. New York, in 1835, 530 buildings, 52 acres burned, and £3,000,000 worth of property destroyed; in 1845, 300 acres burned over, £1,500,000 value, 35 lives lost. St. Louis, in 1851, 2,500 buildings destroyed. Philadelphia, Pa., in 1850, 400 buildings. San Francisco, in 1851, 2,500 buildings, and a number of lives lost; property value, £2,000,000. Portland, Me., in 1866, more than one-half of the city; 200 acres burned over, and 1,743 buildings destroyed. Chicago in 1871, known as the "Great Fire"; 2,124 acres nearly covered by buildings entirely burned over, including 17,430 buildings; many lives were lost, and property valued at £20,000,000 was destroyed. Boston, Mass., in 1872; 65 acres of the mercantile section burned, including 776 buildings; nearly all of brick-and-stone construction; property valued at £25,000,000.

CONSTRUCTION OF BANK AND OFFICE FITTINGS.*

BY GEORGE ELLIS, A.B.I.C.C.

BANK fittings include specimens of the highest class of joinery. It is intended in this article to describe and illustrate by a typical example the most approved methods of construction employed in this class of work. Fig. 1 is a half elevation and Fig. 2 a vertical transverse section of a double-slope desk with fitted pedestals, Fig. 3 being a broken sectional plan, showing in the one half the arrangement of the pedestals and in the other half the arrangement of the desk. Fig. 4 is a longitudinal section of a drawer pedestal; Fig. 5 a sectional plan of same; the remaining illustrations are details that will be referred to as occasion arises.

Honduras mahogany is, perhaps, the best all-round material to use for these fittings, as once it has become thoroughly dry it changes but little afterwards on account of altered atmospheric conditions; it warps or twists but little (unless used very thin), it is fairly hard, and of good appearance. Its one drawback is a tendency to split suddenly in the direction of the grain. No satisfactory reason for this has yet been furnished, but it is obviously not due to shrinkage, for it frequently occurs in long-stacked planks, where both edges are quite free. This defect is met constructively, as far as possible, by tying the ends of wide pieces together with clamps, dovetails or corebolts. The interior parts may, for the sake of economy, be made of deal, pine, or basswood; for parts that can be held firmly, so as to prevent twisting, the last-named wood is suitable, as it is smooth, clean and easily worked; but it is not so hard as deal, and therefore does not wear so long. American oak makes the best drawer sides; next to it comes yellow pine. Oak should always be used for the blocking fillets of the drawers, as all the wear comes upon them.

* All rights reserved.

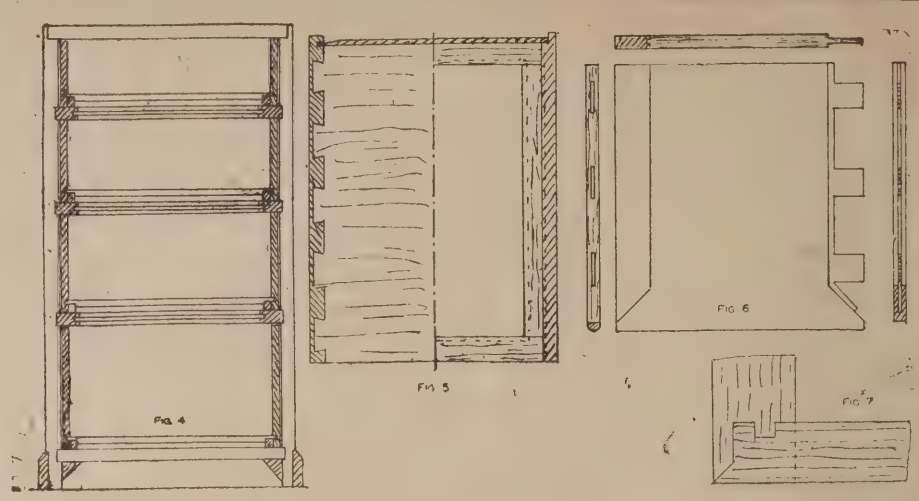

FIG. 4.—LONGITUDINAL SECTION OF PEDESTAL. FIG. 5.—SECTIONAL PLAN. FIG. 6.—PLAN AND SECTIONS OF FLAP. FIG. 7.—ANGLE JOINT OF DESK.

The general construction is as follows:—The desk is composed of two plain ends of 1in. mahogany, shaped to section, the usual angle of slope with the horizontal being 15 deg. The pieces are rebated at the lower edge to receive the bottom, and lap mitred and tongued at their ends, as shown in the detail Fig. 7. The two fronts are of $\frac{3}{4}$in. mahogany rebated at the bottom edge (see Fig. 8), and bevelled to the slope at the top. The openings for the drawers are "cut in the solid," and this necessitates the use of the particular form of joint shown in Fig. 4. The interior divisions, D, of 1in. deal, are kept flush with the rebate at the bottom and shaped similarly to the ends; they are dovetailed-grooved into the fronts and half-notched where the back crosses them (see Fig. 12); this arrangement, permitting both pieces to be continuous, considerably strengthens the desk. The back, also of 1in. deal, is housed and blocked at the ends. The framed bottom is of 1in. deal, flush panelled on the upper side, so that dust shall not accumulate in the interior, and rebated all round the under edges to receive the cockbead (Fig. 8), which, while giving an agreeable finish to the desk, effectually covers the joint at the bottom and strengthens the portion of the front below the drawer openings.

The desk top is formed of a central flat, H (Fig. 2), running the entire length and overhanging the carcase by a margin equal to its thickness ($\frac{3}{4}$in. full), and into this are framed the slopes, I, by mortise and bevel tenon, as shown in Figs. 3 and 4. Between these the lifting flaps, J, are hung. The flaps are mitre clamped at their ends (see Fig. 6), the grain of the flaps running parallel with the front, other-

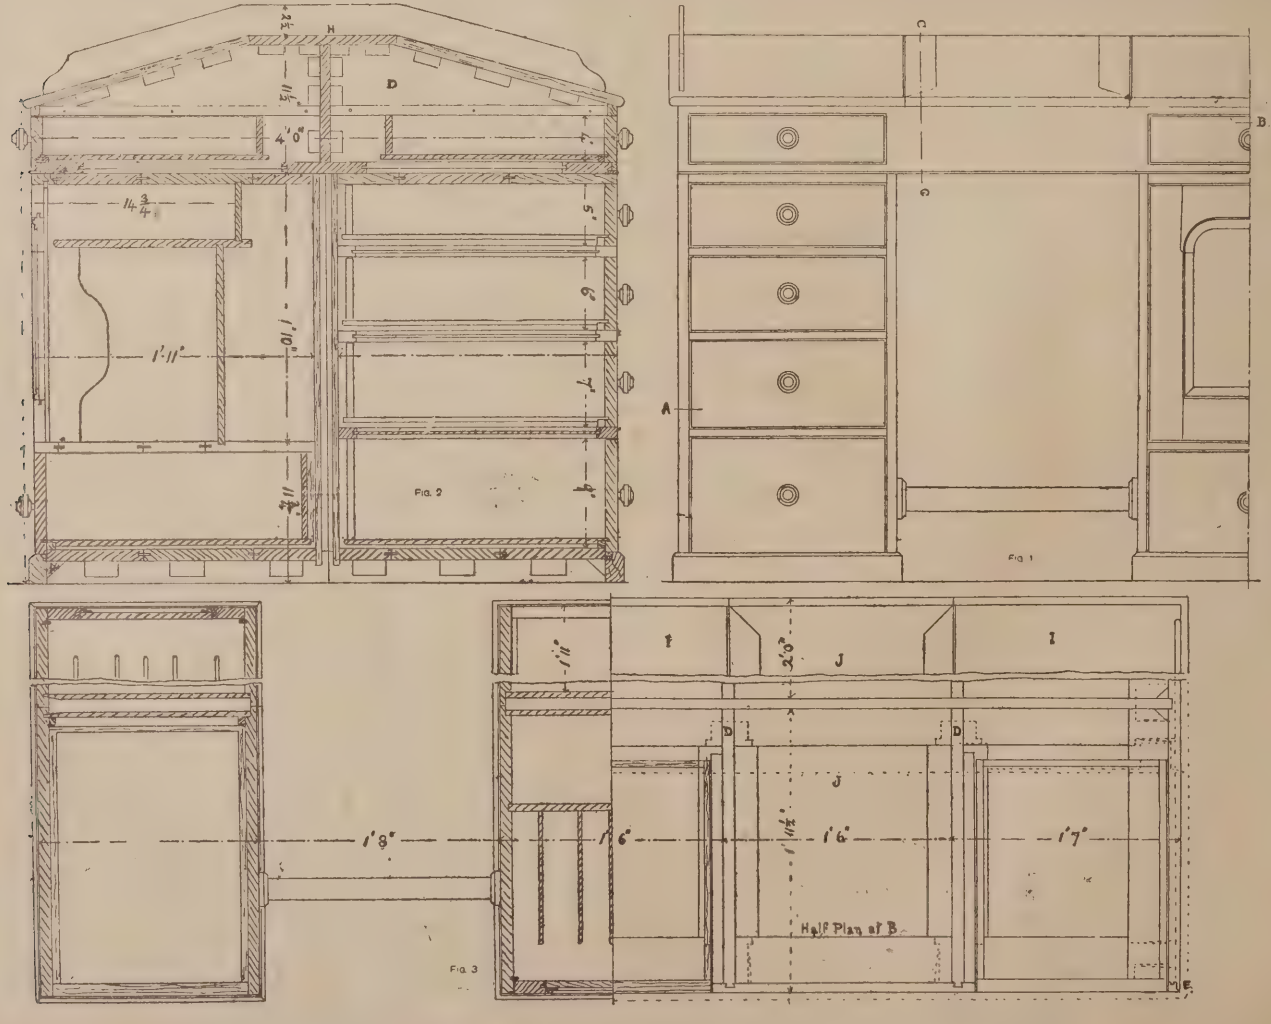

FIG. 1.—ELEVATION OF DESK. FIG. 2.—VERTICAL SECTION. FIG. 3.—GENERAL PLAN.

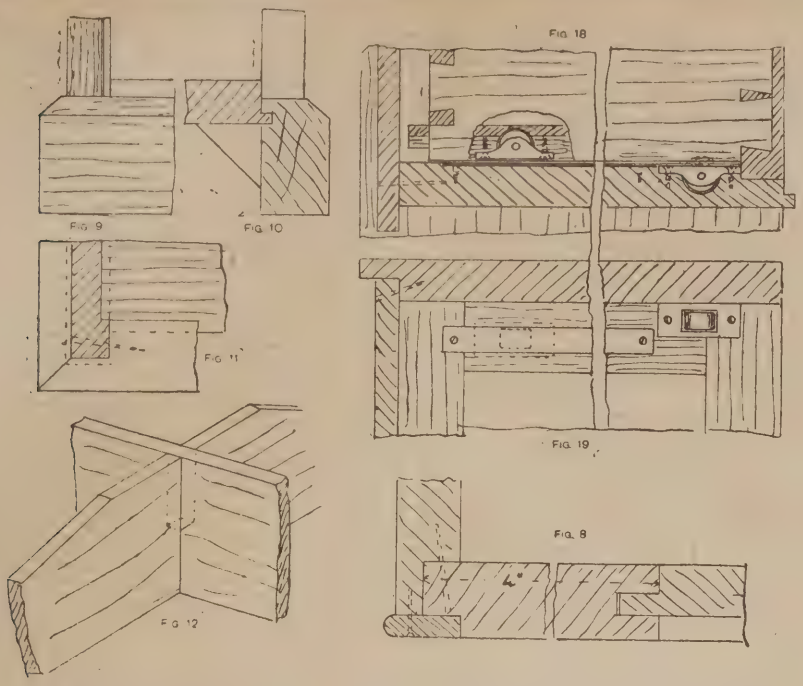

FIG. 8.—DETAIL AT E, FIG. 3. FIG. 9.—ELEVATION OF CORNER OF PLINTH. FIG. 10.—VERTICAL SECTION. FIG. 11.—HORIZONTAL SECTION. FIG. 12.—CENTRAL JOINT IN DIVISIONS. FIGS. 18 AND 19.—PARTS OF DRAWER, SHOWING METHOD OF FIXING FRICTION ROLLERS.

wise they would have to be hung to the clamps and the vibration would soon break the joint at the shoulder. It will be noticed that the clamps do not come quite to the front edge; this is to prevent the end grain showing when the edge is rounded.

The pedestals are composed of solid sides out of 1in. mahogany, with similar deal tops and bottoms (the former edged with mahogany), panelled divisions, the fronts of which are of mahogany and the remainder of deal, a plain $\frac{1}{2}$in. deal back and a $1\frac{1}{2}$in. solid mahogany plinth: these, although finally fixed in pairs connected by the cross skirting, are made separate for convenience of construction and handling. The top is dovetailed into the sides, with "cistern dovetails," the pins, however, being cut back to prevent the end grain showing (see Fig. 5). The panelled divisions are housed into the sides $\frac{3}{16}$in. deep. These divisions should be framed and glued up as a solid, and, so far as the "runners" or sides of the divisions are concerned, should be fitted hand tight and put in the carcase without glue, so that the sides may be able to swell or shrink without splitting. The front division rails are double-tenoned into the sides, to prevent the racking action of the drawers breaking the joints, as shown in Figs. 13 and 14. The back rails are skew-screwed as indicated. Fig. 13 is a section of Fig. 14 taken through the housing on one side, and on the other, just above the division rail (Fig. 15), is a vertical section through a runner.

The bottom is housed in, the sides solid and tongued and blocked to the front plinth; its grain should run in the same direction as the sides, and it can be further fixed by nailing through the skirting sinking, as shown in Fig. 11. The method of fixing the plinth is shown in Figs. 9, 10 and 11. The front piece is sunk and lap-mitred around the edge of the pedestal side, and the cross plinth, $\frac{5}{8}$in. thick, sunk in the sides and fixed by screws from the inside. These screws should be in slots in the side. The back is nailed in a rebate on one edge and fixed in a groove on the other to allow for shrinkage. The cupboard pedestals vary in construction only in the provision of a grooved-in bead to form a rebate for the door and in the internal arrangement of the cupboard portion. This is divided horizontally by a $\frac{3}{4}$in. deal shelf, which forms a top for five $\frac{5}{8}$in. partitions, variously spaced to meet requirements, and stopped by a $\frac{3}{4}$in. deal false back.

The drawers are made with 1in. fronts, $\frac{5}{8}$in. backs, and $\frac{1}{2}$in. sides and bottoms, grooved and dovetailed together in the usual manner, as shown in Figs. 16 and 17. The bottoms should be rebated for the blocking slips and slot screwed at the back, as shown. Drawers intended for cash or other heavy goods should be fitted with friction rollers and rails. The rollers are fitted as shown in Figs. 18 and 19, one pair sunk in the drawer bottom, the other pair in the runners. The front pair should be in the carcase and the rear pair in the drawer (see Fig. 16). By this arrangement the drawers are always in bearing. Laterally they should be arranged so that they will just clear each other, so that the drawer may be drawn completely out. This is shown in Fig. 19, where the brass strip is represented on which the rear roller runs, the position of this being indicated by the dotted lines. The joint beads round the openings in the pedestal, are shown worked on the solid. This method, although costing more for fitting up, is much superior to that of planting them round the edges of the drawers, in which the pieces across the ends are continually falling out, and also, when the front is of some width, preventing it shrinking.

THE CESSPOOL.

A COMPARISON OF PRIMITIVE AND MODE RN METHODS OF TREATING SEWAGE.*

BY LEONARD P. KINNICUTT, D.S.

BACTERIA are a low form of vegetable organism which multiply by a process of transverse division. Though commonly considered as dangerous enemies, they are in fact our greatest friends, for it is only a comparatively few species, those that exist on living matter, that cause disease. The great majority obtain their nutritive material from dead animal and vegetable matter, and resolve these substances into similar compounds, as carbon dioxide, water, ammonia, nitrates, which are the food supply of higher vegetable life. Were it not for the presence of these bacteria, disposing, as they do, of effete organic matter and changing it into plant food, human life on this earth would, seemingly, be impossible. These are the bacteria that are present by the hundreds in a cubic foot of air, and in a cubic centimetre of so-called pure water, and by the millions in a centimetre of polluted water or of sewage.

For the destruction of dead organic matter, both of the two groups of bacteria are necessary; the anærobic to disintegrate and liquefy the complex organic substances, the ærobic to change those simplified and liquefied compounds into harmless substances.

Taking the above as a brief outline of wha takes place in the decomposition of excreted and effete matter, we are in a position to consider the

Changes that take place in the Cesspool.

Into the cesspool enter all the waste products of human life, and with these waste products millions of bacteria, both anærobic and ærobic. But, the contents of the cesspool being practically shut off from air and light, it is a most suitable environment for the development of the anærobic bacteria. These bacteria immediately begin to act upon the solid compounds in the excreted and other household waste. The complex nitrogenous substances are broken up and liquefied, also compounds like cellulose in its various forms—like paper, starch, woody fibre—are disintegrated, and, finally, if the action continues a sufficient time, all that remains in a solid state is chiefly what we can call the ash or the mineral matter of the animal and vegetable substances that entered the cesspool. The action that takes place in the cesspool might be compared to the process of combustion. In the cesspool the bacteria have taken the place of heat.

* Summary of a paper read before the Massachusetts Association of Boards of Health on July 29th, 1900.

Liquid that passes through the cesspool as it leaches through the soil, or as carried away by a drain and allowed to run on land, comes in contact with air, and the conditions become favourable for the development of the ærobic bacteria, and the final process of purification begins. The liquefied compounds are most easily acted upon by the bacteria, and the compounds changed into harmless gases and mineral substances.

It thus appears that our forefathers, without any knowledge of bacteriology, devised one of the most efficient methods for the purification of household waste. The question as to the

Dangers Attaching to a Cesspool

I do not at this time care to consider at any length; but it seems to me that the danger arising from the use of cesspools has been over-estimated. Certainly, in the decomposition of the solid complex compounds of the anærobic bacteria, a large amount of gas is given off. This gas, however, is composed chiefly of carbon dioxide, marsh gas, hydrogen, and nitrogen, and resembles concentrated sewer gas, but does not contain, as far as we know, any amount of sulphuretted hydrogen or other poisonous gas.

If the liquid in the cesspool is on different levels at different times, so that the sides at times become dry, there may be danger of some

GALVESTON COUNTY COURTHOUSE, TEXAS, U.S.A.

pathogenic germs being in the gas that escapes from the cesspool, but the above condition cannot exist if the inlet pipe enters the cesspool at a lower level than the exit drain.

If the liquid in the cesspool percolates through the sides of the cesspool and the soil is hard clay, it may, while still containing a large amount of soluble polluting matter, enter a water-supply, as a well or a stream; but if the cesspool is in sandy soil there is very slight, if any, danger, as late experiments have shown that organic matter in the condition that it is in on leaving the cesspool is changed with the greatest rapidity into absolutely harmless compounds. If the liquid is carried by a pipe from the cesspool and discharged over land or near a well or stream, it seems that there could be no danger. As to the escape of any dangerous gas from the soil near a cesspool, I do not see how it is possible.

The Scott-Moncrieff and Cameron Systems.

Having thus tried to answer the question why cesspools do not quickly fill up with solid matter, and also to describe what changes take place in the cesspool, I wish to describe how this method has been made use of by sanitary engineers for treating sewage on a large scale.

Mr. Scott-Moncrieff, the well-known sanitary engineer, was, I believe, the first to recognise that the bacterial purification of sewage took place in two stages, and that the first stage should serve as a prelude to further treatment. He erected, in 1891, at Ashland, a tank, or cesspool, for the express purpose of liquefying the solids in sewage, in which the sewage was forced upward over a bed of stones.

The credit, however, of showing that a modified cesspool could be advantageously used for the treatment of sewage of cities and towns belongs to Mr. Cameron, of Exeter. The process was named by him the septic treatment, and it is by this name that it is now known. He built at Exeter an underground tank of cement-concrete, 65ft. long, 19ft. wide, and of an average depth of 7ft., and having a cubical capacity of 53,000gals. The tank was covered with a concrete arch, and a portion of the tank near the inlets was made about 3ft. deeper than the rest, and partially cut off by a low wall, forming a couple of pockets or grit chambers to retain sand, grit and road washings. The inlets were carried down to a depth of 5ft. below the surface, so that air could not make its way down with the sewage, and also so that gases could not escape from the tank back into the sewer. The effluent outlet was also below the level of the liquid, and, to avoid any current that would be liable to carry with it any of the floating matter from the surface, a cast-iron pipe was carried across the whole width of the tank 15in. below the surface, and on the lower side of this pipe there was a continuous opening about ½in. wide. An iron pipe, about 1½in. diameter, extended out of the top of the tank to allow the escape of gases which were formed, and the sewage in the tank could be inspected by opening a manhole constructed in the centre and having glass windows. There are also five beds filled with crushed clinker or coke-breeze, which are admirably adapted for the cultivation of ærobic bacteria, and the liquid as it comes from the tank, having undergone the first stage in the process of putrefaction, is now in just the right condition to be acted upon by the ærobic bacteria.

In August, 1896, the main sewer of St. Leonard's, where there is a population of 1,500 and an average daily flow of sewage of 57,000 gallons, was connected with the tank, and the above volume of sewage has been continuously passed through the tank since that time. The effluent from the tank falls over a wall about 1ft. high, which effects slight aeration, and then by means of the alternating gearing is caused to pass automatically on one or the other of the beds.

What are the changes that take place in this tank? They are exactly those that take place in the cesspool. The most marked change is the disappearance of solid matter, and it has been demonstrated that from one-half to two-thirds of the total solid matter has decomposed and liquefied.

That a large volume of gas is given off from the septic tank is seen not only at Exeter, but everywhere the septic tank is in use. The only determination as to the amount of gas that is given off is, so far as I can learn, one that was made by H. W. Clark, chemist for the Massachusetts State Board of Health, working with a very small experiment tank. His results indicate that from five to six tenths of a cubic foot of gas is formed from 100gals. of sewage.

Analyses of the gas have, however, been frequently made, and though, of course, it must vary greatly from time to time, the following analyses, made by Dr. S. Rideal, give an idea of its composition:—

	Per cent.
Carbon dioxide	0·3
Marsh gas	20·3
Hydrogen	18·2
Nitrogen	61·2

That the action which takes place in the open septic tank is very similar to that which takes place in the closed tank is shown by a series of experiments made by Mr. Fowler at Manchester. He made daily analyses for one month of the effluent from an open tank and of the effluent from a closed tank, both being supplied with the same sewage. The following table gives the average of these daily analyses. The results, as seen, are almost identical:—

Parts in 100,000.	Open tank.	Closed tank.
Free ammonia	3·20	3·10
Albuminoid ammonia ..	0·50	0·51
Oxygen consumed	8·46	8·43
Chlorine	16·40	16·10

The Value of the Septic Tank.

The real practical value of the septic tank, or we might say the cesspool, is that it destroys suspended matter without forming any great amount of sludge or precipitate, thus having a great advantage over any chemical precipitation process. Also by using a septic tank, allowing the effluent to come in contact with air and then passing it on to a bacteria bed, the two phases of purification are kept separate, and better work is naturally to be expected.

What we hold as true to-day we are told to-morrow is false, and so, in a year or so from now, I may come before you and say that the changes that take place in the cesspool are not due to bacteria, but are due to chemical action; and I say this now because there are certain facts that point in this direction. There is a class of chemical substances known as enzymes, or unorganised chemical ferments, which are the products of vegetable and animal life, and which, in minimum amounts, without being themselves used up, are able to break up and decompose large amounts of complicated and insoluble compounds. Many of the enzymes being the products of anærobic bacteria, they would naturally occur in the septic tank, and a large amount of the decomposition may thus be chemical, rather than bacterial.

Whatever is the cause of the changes that take place in the cesspool or septic tank, the changes are those that I have described, and I only hope that I have been able to point out to you that the most modern method of treating sewage is, in fact, the method of our forefathers.

Galveston County Courthouse.—This building, which is illustrated on this page, was almost totally destroyed by the recent tornado at Galveston. It was the last large building designed by Mr. Arthur A. Messer, architect, of London and Woking, before he left for this country, and cost about £60,000. Building operations commenced in 1897, and it was finished about a year later.

A Discovery in Newgate Street.—The excavations necessitated by the construction of the Post Office telephones have resulted in finding portions of the original New Gate. While digging the trenches in Newgate Street, the workmen came across a quantity of Kentish rag about 4ft. from the surface, and not many yards to the east of Old Bailey. Investigation shows that the spot at which the discovery was made is about the point where the "New Gate" spanned the roadway. One piece of the relics, at least, formed the portion of a gateway, and the conclusion drawn is justifiable. This particular portion consists of a piece of lead some 7ins. or 8ins. in length. It is corroded with the soil of ages, but evidently it formed a part of the gate support, or possibly a hinge.

New Patents.

These patents are open to opposition until November 5th.

1899.—Air-bricks.—21,296. H. W. ROBERTS, Kingston House, Newmarket. The brick is so constructed that the air first passes through a slightly converging opening, then through a kind of neck into a cavity beyond, this cavity being covered (on the inside wall of the apartment or other place to be ventilated) by a lipped metal box. The form of the brick greatly diminishes the force of the incoming current.

1900.—Hollow Bricks.—10,180. J. C. SELLARS, 69 Bridge Street, Birkenhead. The brick, or block, is made of artificial stone and is hollow. On the top side a ledge extends for the whole length, and there is a corresponding recess in the bottom side: this for interlocking. There is also a slot at each end of the brick, on the top side, to receive a T-iron, which connects one row with another; while a continuous tube runs through the whole and gives great strength and rigidity to the wall. The invention is also applicable to floors, stairs, &c.

Camera for Architectural Work.—10,586. E. MILNER, 250 Wandsworth Bridge Road, London, S.W. In front of the plate is arranged a transparent screen, having concentric lines accurately drawn in relation to the distance of the screen from the light inlet of the camera (a pin-hole being preferred to a lens). The result is that the resulting photograph is marked with lines, which may be divided into degrees, so as to clearly indicate the angles which any parts of the building make with the point of view. It is claimed that the invention is specially applicable for the purpose of producing permanent records of buildings, walls, &c., to be used in connection with disputes.

The following specifications were published on Saturday last, and are open to opposition until November 12th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—17,724, DUTTON AND DUTTON, oil, gas, and similar motors. 17,966, HADDIN (*Soc. Berthe & Cie.*), artificial granite and process for manufacturing it. 18,058, MEURER AND BORMANN-ZIX, manufacture of calcareous sandstone. 19,956, PEART, wrenches. 20,347, PRYOR (*Summers*), manufacture of artificial marble and stone. 21,300, KAY, window fittings. 21,439, MALE AND HODGSON, flushing apparatus for sanitary and other purposes. 21,990, OPPENHEIMER (*Actiengesellschaft Mix and Genest*), cord grips for electrical apparatus. 21,991, OPPENHEIMER (*Actiengesellschaft Mix and Genest*), porcelain interiors for electric incandescent lampholders. 22,154, VON RITTERSHAUSEN, filters. 22,248, PRESTON AND RALSTON, ventilation of tunnels, buildings and other places. 22,345, PEYRUSSON AND PEYRUSSON, production of vitrifiable colours, enamels, &c. 22,475, BELL AND BELL, door and other latches. 22,519, BAXTER, operating mechanism of stone-breaking and ore-crushing machines.

1900.—1,458, SCHRÖETER, composition for and method of fireproofing. 5,499, VANDERBORGHT, bath heater. 5,505, NEWTON, ash-pans for domestic and other fire-places. 8,731, HILL, can or receptacle for painters, French polishers, &c. 10,275, HORN, kilns. 11,987, CORDES, process for the manufacture of artificial stone. 12,336, SLOCUM, apparatus for the manufacture of gas. 12,648, ENDRES, means for securing flooring boards to joists and beams. 12,842, ZOBEL, machine for clearing and assarting roads, &c. 12,876, JOHNSTON, PALMER AND COENEN, trolley for overhead electric traction. 12,984, WESTPHALEN, filters. 13,269, HUGO WARSCHAUER AND WILHELM RITSCHEL, air-moistening apparatus. 13,280, ACKERMANN, arc lamps.

A Public Abattoir and Meat Market for Hull is proposed to be built by the Corporation.

Engineering Notes.

The Ventilation of Holborn Town Hall is being rearranged under the direction of Mr. Charles Herbert Shoppee, F.R.I.B.A., of John Street, Theobald's Road, and Mecklenburg Square, W.C.

Central London Railway.—The Bond Street Station was opened for traffic for the first time last week. The delay was occasioned through a mishap to the machinery for working the lifts.

Two of the New Tunnels under Crewe Railway Station, which are part of the great extensions which have been in progress for several years past, were opened last week for through traffic. These are part of the extensions on the Crewe to Liverpool line.

London Water Excellent.—In their report upon the composition and quality of the water supplied to London for the month ended August 31st, Sir William Crookes, F.R.S., and Professor Dewar, F.R.S., state that all the 208 samples examined by them were found to be clear, bright and well filtered.

Electric Tramway for Rhyl.—After holding a public enquiry, the Light Railway Commissioners have decided to sanction the construction of an electric tramway from Prestatyn to the Marine Lake, Rhyl, a length of about 7 miles. The route follows the sea coast. The capital of the concern is £7,500, and the Rhyl Council will supply the electricity. The scheme is to be completed by next season.

An Improved Electric Shade Tilter is a speciality recently put upon the market by the Improved Electric Glow Lamp Company, Limited, of 103 Queen Victoria Street, London, E.C. By means of this simple device any lamp shade can be tilted to any desired extent, thus avoiding the inconvenience common to most offices, where the light is pendent in one position. The price in polished brass is 6s. per dozen.

Society of Engineers.—The members and associates of this society recently visited the works of the Gas Light and Coke Company at Beckton. The carbonising plant consists of 8,404 retorts, contained in fourteen retort houses, and about one-half of these are operated by machinery, hydraulic power, compressed air and power transmitted by ropes being used. The daily production of gas, including oil gas, of which about 8½ million cubic feet are made, is about 58 million feet.

Proposed Iron Bridge over Ostend Harbour.—The Belgian Government is considering a project for building an elevated iron bridge over the Ostend Harbour at a level of 52 metres above the sea. There would be a hanging electric car for passengers and carriages such as is established at Rouen (see supplement to BUILDERS' JOURNAL for January 10th last). The fare would be only two centimes. On the east side of the port, which would thus be put in direct communication with the town, is to be built a "garden city," consisting of villas surrounded by streets and squares along the sea front.

A Reservoir as a Swimming Bath.—A disused reservoir on the Stourport Road, Kidderminster, has been turned into a swimming bath for the borough. The bath is one of the largest in the Midland counties. The reservoir was constructed early in the seventies as part of the first scheme carried out for supplying the town with water. At first it had a gravelly bottom. Then vegetable growths were discovered and the bottom was asphalted. In time it was found that the reservoir was inadequate for the requirements of the district. Indeed, its elevation was not sufficient to supply all the houses with water by gravitation, and the new covered reservoir was constructed. For a considerable time the old reservoir was continued to be used for supplying Stourport with water. The water for the new bath is pumped into it direct from the upper well, and when it is necessary to change the supply this can at once be done by opening a valve, and the disused water will flow into the river Stour.

Law Cases.

A Building Line Case.—At the Chorley Petty Sessions recently Robert Counsell, of Withnell, was summoned under the Public Health Act by the Withnell Urban District Council for building without the consent of the Council a wall beyond the front main wall of the adjoining buildings, and continuing after having received notice to remove it. Mr. J. W. Carter, clerk to the Council, quoted the section of the Act upon which he relied, which declared it unlawful to make any addition to a house or building beyond the front main wall of the house or building on either side. Some time ago the defendant built a number of houses in School Lane, for which he submitted plans. These showed the main building, the garden area and the garden wall, but without submitting any further plan he had built in front of one of the houses a brick wall about 12ft. long, 6ft. 5in. at the side, and about 2½ft. high. After some consultation, the Chairman said the bench had no hesitation in deciding that there had been a breach of the law, and defendant would be fined 1s. a day for the offence and must pay the costs. Defendant's solicitor gave notice of appeal against the decision.

Alterations to Premises: A Curious Counter-claim.—At the Brighton County Court the case of *Smale* v. *Gouraud* was recently heard before his Honour Judge Martineau. Mr. S. C. Smale, a Hove builder, sued Colonel Gouraud, of Gwydyr Mansions, Hove, for £36 18s. 6d., asserted to be due for work done and materials supplied in respect of premises which defendant had rented from the plaintiff for use as a laboratory. The defendant contested the claim on the ground of bad workmanship and excessive charges, and brought a counter-claim for £5,000 for damages sustained by the plaintiff's alleged breach of contract, of which he claimed there should have been specific performance. In giving his decision, the Judge said that during February the defendant required a laboratory for his inventions, and being recommended plaintiff's premises he arranged to take the whole of the first floor. Certain alterations were needed, and plaintiff was engaged to do the work. He gave an estimate for some of the rooms, and for others he was left to charge reasonable prices. The defendant complained that nearly all the work executed by the plaintiff had been badly done. His Honour said he had viewed the premises, and, in his opinion, the work was not only rough, but of an inferior character; and he should have been inclined, had the matter rested there, to make some reduction on the plaintiff's claim; but he had to consider one or two other matters, among which was the fact that a letter the Colonel had written was an indication to Mr. Smale to do the work cheaply. In consequence of this, the work was done cheaply, and as a sort of makeshift. Although away from home, Colonel Gouraud had left an engineer at the laboratory, and it would have been possible to make complaints. His Honour said he was not prepared, taking these matters into account, to make any deductions from Mr. Smale's bill, which he therefore allowed as claimed. Referring to the counter-claim, his Honour said: "It's a terrible counter-claim." The Colonel estimated his loss from inability to use the premises at £5,000. His Honour dismissed the counter-claim so far as specific performance of contract to let the whole of the premises was concerned, and also so far as respected the damages claimed on account of the loss the Colonel thought himself to have sustained through his not having the use of as much of the premises as he considered himself entitled to. His Honour said he had formed rather an unfavourable opinion of the refusal of plaintiff to give up the two rooms, and assessed the damages at £2; he also gave judgment for £2 against the plaintiff for excessive use of yard.

The Death of M. Jules Machard, a well-known French portrait painter, occurred last week at the age of 61. In 1865 he gained at the Paris School of Art the Prix de Rome, and on returning from the latter city he began exhibiting mythological and legendary subjects.

THE CHURCH CONGRESS.

ART AND RELIGION.

THE evening meeting of the Church Congress in Lovaine Hall, Newcastle-on-Tyne, on Wednesday last, was devoted to the subject of "Art: its Relation to Religion."

The first paper was by Mr. W. Hole, who expressed the conviction that art inspired by the teaching of the Church might and ought to be restored to the position which it once held as a recognised means of conveying God's message to His people. While the Church had readily availed itself of the service of architecture, sculpture had in recent times received but timid recognition, and the claims of painting had been almost, if not altogether, ignored. The religious painting had to shift for itself as best it might, to jostle for a place among incongruous surroundings on the walls of exhibitions, or to be hawked about and exhibited under artificial light (a shilling a head for admission) in the back shop of a picture dealer. There was a time, in the earlier period of the Church, when colourless architecture was undreamed of, when all painting was decorative, and when the holiness and sanctity of what was beautiful was bound up in men's minds with the idea of the beauty of holiness. For nearly a thousand years after the establishment of Christianity as the religion of the Empire all art was religious in its inception and purpose. But the dawn of the Italian Renaissance marked the period whence we might date at once the increased vitality of each individual member of the body of art, and also that little rift between them which heralded their ultimate severance from and independence of each other. Worldly knowledge and manual skill were increased, and with them the pride of individual accomplishment, without the counterbalancing and restraining power of wisdom to maintain the ancient bond of union so valuable to all alike. Advocating

The Revival of Mural Decoration

in our churches, Mr. Hole said that it should be remembered that a mural painting was not an independent and isolated work of art, but part and parcel of an architectural scheme. It started from an architectural basis, and its merits or demerits as decoration must be judged entirely with reference to its environment. Whether, therefore, it took the form of a picture or one of simple pattern the decorative painting must be designed in conformity and in harmony with its surroundings, and with due consideration to essential features of the building or surface whose characteristics it was its duty to beautify and enhance. He would, therefore, welcome with thankfulness the formation of a guild or brotherhood of church artists, who would be brought into touch with one another for their mutual help and encouragement—a guild which should include in its membership architects, painters, sculptors, workers in wood, metal, glass and needlework—all, in fact, who were willing to devote as a free gift a tithe of their time, skill, and labour to the glory of God and the service of the Church.

Mr. Stirling Lee

followed, and, speaking of the present divorce between Art and the Church, said that Flaxman in his lecture on English sculpture had put the case very clearly:—"The reign of Henry the Eighth, and those immediately succeeding him, were employed in settling disputes of faith by public executions, as either of the contending religious parties prevailed; this mutual and undistinguishing spirit of persecution extended equally to the destruction of man and his ingenious labours. In the year 1538 Henry the Eighth issued an injunction that all images which had been worshipped, or to which idle pilgrimages had been made, should be taken down and removed from the churches; and in the reign of Edward the Sixth, in the year 1541, his uncle, the Duke of Somerset, the Protector, and Council, ordered all images, without distinction, to be thrown down and destroyed. This was understood and executed on pictures as well as sculpture, and there is good reason to believe that we are indebted to the immense number of these works, which tried the patience of their enemies before their destruction was completed, for what remains of them at this day." We could imagine if the Popes of that time had been actuated by the same iconoclastic fury against the Greek, Roman and Italian art, what the world would have lost in beauty, thought and historical record. Henry the Eighth himself was the first to want a sculptor, and had to import the Italian, Peter Tarreigano, and order him to make for himself the most magnificent sepulchral monument ever conceived. This was never executed.

The Commands for Destruction.

The commands for destroying sacred painting and sculpture effectually prevented the artist from suffering his mind to dwell on the contemplation or execution of any sublime effort, as he dreaded a prison or stake, and reduced him to the miserable mimicry of monstrous fashion or drudgery in the lowest mechanism of his profession. This unfortunate check to our national ability occurred at the time when art was making its greatest progress on the Continent; so, whenever England wanted a painter or a sculptor, he had to be imported; and this importation had continued until our own day, when at last we could say that our best sculptors were Englishmen and capable of doing great work, should they have the opportunity. Certainly no field could give greater possibilities and opportunities than the Church.

Papers by Mr. E. S. Prior and Mr. Selwyn Image followed.

Mr. G. F. Watts' Letter.

The following letter was read from Mr. G. F. Watts:—

"Little Holland House, Kensington, 1900.

"Dear Lord Bishop of Newcastle,—Your invitation to write a paper upon the relation of art to religion, I regret to say, I found myself unable to accept, limited, as I am, by the exactions of my own unfinished work and by want of strength.

"I could not, however, altogether reject the opportunity you so generously gave me of writing a few words to express my conviction that art, as we understand it, in its three presentations—architectural, pictorial and plastic—has exactly the same relation to religion as that which poetry and music have, and to assert for art the claim to a yet higher place than it is commonly understood to hold, convinced, as I am that it is a Divine voice, uttering through all time its message to mankind, the handmaid of religion, lifting the mind into an atmosphere of wonder and of worship. As music echoes the Divine voice heard in creation, art should clear the sight to the manifestation of the Divine power in the loveliness of creation. The creative faculty in man, working in the same direction to interpret the same purpose, shown in the apparently loving care and intention, evident in beauty of line and colour.

"In no spirit of irreverence this may be claimed: the splendour, the order, the fine perfection in the smallest detail of form and structure, of perfume and of colour, apparently not in the least necessary to existence, as these are all occasionally absent, reveal to us the high position that beauty takes in the service of the Creator. May we not, therefore, claim for man's creative work such high uses in the service of religion, stimulating thought to high and noble action?

"One who would suggest ideas by form and colour is like the child of an artist, whose delight in the beautiful things he sees emanating from his father's studio finds expression in endeavouring to do something of a similar character; consequently art, being unconscious worship, should find place wherever worship is the object.

"I would also express my conviction that art is inherently part of the great oneness of a creation, where the Creator has made His own house beautiful with all gracious and noble beauty of sky and of cloud, of mountain and of valley—a part of that creation in its vastness, its complexity, and its completeness, one in its law, and in its obedience to that law.

"No art or science, and, indeed, no possible acquirement, can really be desirable that does not do something to develop those qualities which distinguish humanity from the lower creation, the purely and consciously moral perceptions, and still more those qualities on the spiritually sensitive side.

"On this side, art should be unquestionably an important factor, for the highest, perhaps unutterable, thoughts can be presented to the mind by symbolic suggestions.

"To the eye that seeks this shall be made plain, the firmly-planted foot shall not be set down in vain, even though the law of conflict, not unkind, and necessary to avert stagnation, makes it hard.

"Failure is present in all highest endeavour. We have to know that nothing can be shaped by our hand, but in the soft and the hard, the dry and the moist, in darkness and in light, but with reason and with love, the most conflicting elements can be used and combined into the finest harmonies—a voice breathing through the soul, making itself rather felt than heard, and yet giving intimations of truths, enough for guidance, for hope, and new stimulus to higher attainment."

On Friday afternoon the subject for consideration was

The Housing Problem.

The Rev. J. W. Horsley (Woolwich), read the first paper. Sarcastic seemed the phrase, "the housing of the poor," when he thought of the 124,000 people in his civil parish living on less than a mile square; of nearly half a million in London whose home consisted of one room; of 4,575 one-roomed homes in Spitalfields, 1,400 being occupied by numbers rising from four to eleven persons; of a six-roomed tenement in a City slum inhabited by six families at 6s. a week each—that was £93 12s. per annum for a cottage in an alley; and of one sanitary inspector for 40,000 people. It was the stye that fouled the pig before the pig further fouled the stye, and therefore, bad landlords, whether of village hovels or city slums, were chiefly responsible for crime.

Dr. Steggall read the second paper, which reviewed the history of legislation on the subject and showed that the real root of the difficulty lay not so much in the legislature as in the apathy and negligence of the local authorities. He pointed out that about thirty years after Lord Shaftesbury's Act was passed in 1851 only one public body had put it in operation, and later Acts had scarcely been enforced more often.

Sir T. Wrightson contributed a paper in which he called attention to the valuable provisions of the Small Dwellings (Acquisition) Act, by means of which a man might be financially assisted to become the occupying owner of his house. There was nothing to prevent philanthropic agencies undertaking to build the house and lend the money to the purchaser up to within 10 or 15 per cent. of the whole value, charging such a rate as would pay a substantial interest.

Councillor Thompson, discussing the question from the standpoint of the duty of local authorities, said the authorities did not carry out their powers because they dared not. If they did, councillors would lose their seats and the officers would lose their salaries or situations. The clearance of insanitary areas, by restricting still more the inadequate accommodation, tended to increase overcrowding and to force up rents. Another fatal obstacle to improvement schemes was the enormous cost. Clearances had been effected by the London County Council at a cost of from £50 to £70 per head, or from £300 to £500 per family. They gave the money to the owners of the slum.

The Mayor of Newcastle thought private enterprise would always be able to provide houses for well-to-do artisans; corporations could never do it so well and effectively.

The Royal Victoria Hospital at Belfast, the foundation-stone of which is to be laid in the spring of next year by the Prince and Princess of Wales, is to be built from plans by Mr. William Henman. The commission was conferred after the Belfast committee had inspected the principal hospitals in Great Britain, and the work is now being vigorously pushed on by Mr. Henman and his partner, Mr. Thomas Cooper.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Temple of Theseus, Athens.

WOLVERHAMPTON.—PUZZLED writes: "I have been drawing out the Order from the above temple, as one of the R.I.B.A. intermediate 'Testimonies of Study.' Up to the present I have taken all particulars from Spiers's 'Orders,' but on referring to Gwilt's 'Encyclopædia' I find nearly all the dimensions to be rather less than those shown in Spiers's. The discrepancies appear to be about as follows (these are the several heights):—

	Spiers's.	Gwilt's.
Cornice	1ft. 4½in.	1ft. 0.75in.
Frieze	2ft. 11½in.	2ft. 8.55in.
Architrave ...	2ft. 8¼in.	2ft. 8 9in.
Columns	16ft. 9½in.	18ft. 8.8in.

By which authority would you recommend that I should be guided? Also, by what is the module regulated in this temple, since, according to Gwilt, the columns of the portico are of different diameters?"

The dimensions in "Gwilt" are the same as those given by Mr. Penrose, and may therefore be taken as correct. For the determination of the module, we only know the Vitruvian method, which probably dates from the first century B.C. It was contrived by the Roman architects to obviate what they regarded as defects in the Greek types. Briefly, they aimed at a more open arrangement of the peristyle; and this, of course, led to a reconstruction of the Greek standards for setting out the work. In view of the requirement just mentioned, it is natural that Vitruvius should lay stress on the elegant proportions of the Ionic and the Corinthian, while he speaks somewhat disparagingly of the Doric, which was not so adaptable. Beginning with the hexastyle Ionic of approved eustyle proportions, Vitruvius divides the front of the temple into eighteen parts, one of which served as the standard, and stood for the diameter of the columns—excepting those at the angles, which were a little thicker. The change wrought by this deviation from the Greek proportions is well shown by comparing the hexastyle Ionic temples at Priene and Teos, on the coast of Asia Minor. These two temples are nearly alike in size and plan, but that at Priene belongs to the time of Alexander and follows the Greek proportions, while that at Teos is Roman and shows the proportions of Vitruvius. In considering the Doric Order we find a similar liberty taken by the Roman architect with the proportions of the Greeks; indeed, Vitruvius frankly says that the rules he is about to give have been so amended from the Greek that anyone may now be able to design a sacred building in the Doric fashion without a single defect! From this point it is clear that our immediate purpose will not be served by following Vitruvius much further, so we merely add that according to his method the front of a hexastyle Doric temple of approved eustyle proportions should be divided into forty-four parts, one of which is called a module, and from the module so found the distribution of all the parts is regulated: the thickness of the columns is two modules, and any variation there may have been at the angles is not mentioned, but it probably followed the Ionic, as did the diminution and the eutaxis; anyway, it is not likely that the variation affected the standard of measurement obtained as above. J. A. M.

Examinations for Sanitary Inspectors.

LIVERPOOL.—S. S. writes: "In your issue for September 12th you give particulars of the examinations of the Sanitary Institute. I should be glad if you could tell me (1) what books would be the best to study to qualify as a sanitary inspector; (2) what the age limits are, and the conditions for entering. I have had a certain amount of practical experience, but am desirous of gaining in my spare time the theoretical knowledge.

(1) The following books may be studied with advantage:—Mitchell's "Building Construction"; Knight's "Annotated Model By-laws"; Willoughby's "Health Officers' Handbook" (Crosby Lockwood and Son); Coleman's "Sanitary House Drainage" (Spon); and Moore's "Sanitary Engineering" (Batsford). In addition to a sound general knowledge of building construction, drainage, and sanitation, the candidate must be thoroughly conversant with the various Acts and model by-laws relating to the duties of an inspector of nuisances. He must also be familiar with the method of inspecting dwellings, dairies, slaughter-houses, cow-sheds, &c.; the characteristics of good meat, fish, milk and vegetables; the regulations affecting persons suffering from infectious diseases; and the ordinary methods of disinfection. (2) A certificate is not granted to any candidate under twenty-one years of age. Satisfactory testimonials must be furnished as to age and personal character. The examination is partly written and partly *viva-voce*, the whole occupying a portion of two days. The fee is £3 3s., and formal application must be made fourteen days before the date of examination. A pamphlet is published (and may be obtained at the offices of the Sanitary Institute, price 6d.) containing detailed particulars, together with the copies of the papers set at previous examinations. T. E. C.

Building a Bungalow.

NOTTINGHAM.—BUNGALOW writes:—"I am about to build a country house for myself at a cost of about £1,000. To guide me in design I have procured Mr. Briggs's 'Bungalows and Country Residences.' Can you recommend any similar work which would be of use. Should hollow brick walls be made with the air-space nearer the inside or outside of the building? Is hot-water heating apparatus to be recommended for a residence, fireplaces, of course, being also provided?"

"Country Homes" (Batsford, 15s. nett), a series of illustrations of modern English domestic architecture, including examples by leading architects, may be of use in addition to the book mentioned by our correspondent. Opinions differ as to the method of building hollow walls. Our own opinion is that the constructive part of the wall should be placed on the inside, so as to be immediately under the superincumbent load of floors, &c., the outer 4½in. being regarded more in the light of a weather-proof or non-conductive covering; thus the wet cannot penetrate beyond the outer skin. If the wall is stone-faced the alternative method is better, but the damp may then penetrate rather far into the wall. The arguments for and against may be found clearly stated in Rivington's "Building Construction: Part II." We believe we have seen it claimed by the makers of the "Tenax" rock composition that a wall built with two 4½in. sections and a cavity of 1in. filled up with their composition is stronger than an ordinary 14in. wall. From our own experience we should say that a heating apparatus in a private house is not to be recommended; but this is largely a matter of opinion. If it is employed at all, we should suggest that it be confined to the hall, landings and passages, but a really good close stove in a central position and in the lower part of a house should answer the purpose. A. G. B.

House Planned Like the Ace of Clubs.

BEWDLEY.—J. W. writes: "Who was it that made a heavy gambling on cards and won, and then built himself a house in the shape of the ace of clubs? I have an impression it is to be seen in Ireland."

We know nothing of such a house. Perhaps some of our readers do, and will let us know.

Flooring for Billiard Room.

PUDSEY.—C. H. P. writes: "Which is the best kind of flooring for a billiard room on the first floor of a house?"

We should recommend querist to provide steel girders immediately beneath the points at which the legs of the billiard table are calculated to be placed. On the top of these girders hardwood supports, brought up flush with the ultimate level of the flooring, can then be fixed; they might be made about 8in. or 9in. square. This would ensure a true and level foundation for the table, and the rest of the floor could be treated in any way desired. By using a solid breeze-concrete floor and small steel joists about 1ft. 9in. apart, with a hardwood parquet flooring, the necessity for the above method would be avoided, but the girders should always be placed beneath the table-legs. A. G. B.

R.I.B.A. Preliminary Examination.

BOLTON.—H. S. writes: "Are Theoretical, Practical or Applied Mechanics and Physics required for the Preliminary Examination of the R.I.B.A.? Please name some elementary books which you advise for this examination."

Full information on all the subjects of examination, and a set of papers recently set, can be obtained in the Kalendar of the R.I.B.A. (price 2s. 6d.) by applying to the Secretary, at No. 9 Conduit Street, W. "Elementary Mechanics and Physics" forms one of the subjects for the Preliminary Examination. There are many good text-books for these subjects—among others may be mentioned Taylor's "Mechanics," 2s. 6d.; and Wright's "Physics," 2s. 6d. A. G. B.

Bonding Walls.

MANCHESTER.—An OLD SUBSCRIBER writes: "In altering some old property it is necessary to thicken out a large number of *old* 4½in. walls to 9in. Which is the way to bond the new to the old, the new work to be in mortar?"

Querist cannot do better than carry the work out in cement, to avoid settlement. He states that mortar is to be used, but we presume he means nothing other than cement mortar. We should say that bonders about one to every 3 sq. ft. would answer the purpose. A. G. B.

Legal Definition of "Drain" and "Sewer."

DULVERTON.—R. L. S. writes: "I am interested in the building of two houses at Dulverton, plans and specifications of which have been submitted to the R. D. C., whose only objection is in regard to the drainage. It was proposed to connect the drainage of the houses with the public sewer in the manner shown on Fig. 1 by the drain A, B, C. This, it appears, will not be allowed, as the Council are advised that the fact of two dwelling-houses being connected to one drain makes that drain a public sewer, for the maintenance of which the Council will be held responsible, and a refusal is given. The consequence is that the two houses will have to be drained in the manner shown in Fig. 2, namely, by laying two drains parallel to each other, and by having a separate connection for each house. I should be greatly obliged if you would kindly tell me (1) if the clerk of the Council is right in saying that the fact of two houses discharging their sewage into one drain (which is entirely within private property) makes that drain a public sewer; and (2) if such be the case, whether the Council has the power to veto the construction? I may say that the Council's by-laws forbid a drain being carried under any part of a dwelling-house when any other course is practicable. Now it is possible to build on sites adjoining the one under consideration between ten and fifteen houses; in fact, the owner contemplates doing so, and if the Council's ruling is right there will have to be ten or fifteen separate drains where one drain would suffice."

The fact that all "sewers" are maintained by the local authorities, while "drains" are private property, has given rise to considerable litigation in order to determine what is a "drain" and what is a "sewer." Under the Public Health Act of 1875 a "drain" is "any drain of and used for the drainage of one building only, or premises within the same curtilage." In the Public Health (Amendment) Act of 1890 the definition of "drain" is "a drain used for the drainage of two or more houses belonging to different owners." The first-mentioned Act applies to the whole

country (except the Metropolis, which is governed by special Acts of Parliament), while the Amendment Act of 1890 is known as an "adoptive" Act, i.e., it is left to the discretion of the local authorities to adopt it or not. The word "drain" being thus differently defined in the two Acts, while at the same time the Amendment Act has been adopted in some districts and not in others, has resulted in several apparently conflicting legal decisions. In the well-known Halifax case of *Travis* v. *Uttley* it was decided by the High Court that a drain taking the discharge from several houses, and constructed on private property (in fact, passing under the buildings), was a "sewer" within the meaning of the Act. A somewhat similar decision was given in the Carlisle case of *Hill* v. *Hare*. In the case of *Seal* v. *Merthyr Tydfil* it was decided that a drain into which sewage flowed from the houses of the owner, as well as from adjoining houses, was a "private drain" within the meaning of the Public Health Act of 1890. Under the Metropolitan Acts it was decided in the case of *The Shoreditch Vestry* v. *Phelan* that when once a drainage pipe becomes a sewer, by being combined with the drainage of other houses, it still continues to be a "sewer" although the pipe afterwards only drains one house. From the foregoing decisions it will

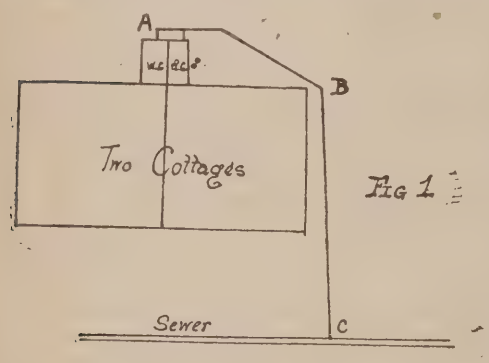

FIG 1.

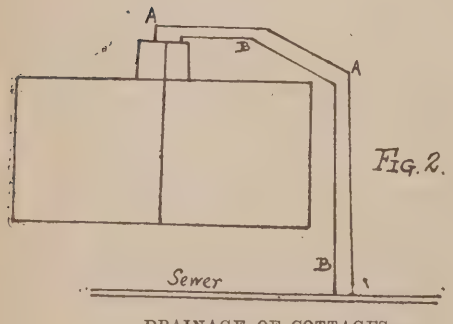

FIG. 2.

DRAINAGE OF COTTAGES.

therefore be seen that the legal definition of a "drain" or "sewer" can only be determined in a great measure by a consideration of the particular circumstances of each case. In some districts the local authorities have been compelled to reconstruct and maintain, at very heavy cost, a large number of so-called "sewers" laid on private ground, and which were originally constructed by the property owners. The result is that many local authorities will not now permit the construction of combined drains for the use of two or more houses, but insist upon a separate drain to each building. Unless there is anything to the contrary in the by-laws, &c., of your Rural District Council, they may refuse to sanction the construction of any combined drains within the area under their control. T. E. C.

Expansion Joints in Roof Truss.

LEICESTER.—J. S. M. writes: "What is the best form of expansion joint for an ordinary steel tie-rod roof truss for a 60ft. span? Should the feet be secured to stone templates with Lewis bolts?"

I do not consider it necessary in the proposed principal to have any form of expansion joint. The foot of principal might be bolted to the stone template by Lewis bolts, through slotted holes, but even this is not absolutely necessary. BREES VAN HOMAN.

Builders' Book-keeping.

SHERBORNE.—E. J. C. writes:—"I shall be obliged if you can inform me whether there is any good standard book on builders' accounts and book-keeping; and, if so, where it can be obtained."

"Builders' Book-keeping: a Perfected System," by Mr. Sidney Saker (published at 95-97, Finsbury Pavement, E.C.), price 3s. 6d.

Books of Church Planning.

REIGATE. — S. writes: "Will you kindly tell me what works would be helpful in church and chapel planning?

"Church Design for Congregations: its Development and Possibilities," by James Cubitt; "English Church Architecture," by George Gilbert Scott, F.S.A., 26s.; and Walcott's "Church and Conventual Arrangement," 9s. 6d. These can be obtained from Mr. B. T. Batsford, 94 High Holborn, W.C.

Government Appointments.

LONDON, E.C.—STUDENT writes: "Are there any Government appointments to be had in the architectural line? If so, what are the examinations I should have to pass?"

Examinations are held for Assistant Civil Engineers in the Admiralty and for Assistant Surveyors in the Royal Engineers. Draughtsmen are also engaged by H.M. Office of Works. There are several books published giving particulars of the Civil Service which will aid you.

THE BUILDING TRADES' GIFT.

MR. EDWIN O. SACHS, Chairman of the Executive of the Building Trades' Gift to the Nation, announces the following further list of contributions:—

	£	s.	d
The Birmingham Master Builders' Association, 2nd instalment (per Mr. W. Sapcote)	200	0	0
The Manchester Builders' Association	65	3	0
Mr. Samuel Warburton, Manchester	20	0	0
The Longridge Builders' Association	9	5	0
Workmen of Messrs. Thompson and Beveridge..	7	11	8
Association of Clerks of Works and Builders' Foremen, Bristol	5	5	0
The Preston Builders' Association..	5	5	0
Messrs. J. and W. Simpson and workmen ..	3	15	6
Mr. J. Parsons and workmen	3	0	0
Workmen of Mr. Samuel Warburton, Manchester	2	11	6
Mr. James Kent and workmen	2	11	6
Workmen of Mr. A. E. Symes, Stratford.. ..	2	2	0
Workmen of Mr. F. Britton	2	2	0
Messrs. W. H. Lambert and Sons and employees	1	10	6
Mr. J. A. Murray and workmen, Reigate ..	1	4	0
Mr. H. B. Oldrey and workmen	1	1	0
Mr. W. Carr and workmen	1	1	0
Employees of Messrs. Bray and Pope	1	0	0

New Church and Schools at Heaton, Newcastle.—The foundation-stones of the new schools to be erected by the Free Methodists at the junction of Heaton Road and Simonside Terrace, Heaton, were laid last week. A church is also to be erected, and, with the school, will cost about £7,500.

A Fish, Butter and Vegetable Market at Douglas, I.M., is about to be erected by the Corporation at a cost of about £3,000. This building has been designed entirely of iron to provide a market that can be kept perfectly open in summer during the hot weather and closed in winter, with the exception of the principal entrances. The site is one adjoining the new butchers' market, and is in close proximity to the quay where the fishing boats discharge. The building measures 115ft. 6in. by 43ft. 6in. at one side of angle and 9ft. 10in. by 37ft. at the other side, and is 12ft. high to the underside of the ornamental steel girders. All entrances are fitted with patent collapsible steel gates. The fish and vegetable markets are divided by a white glazed-brick wall running the full height of the building. There are lavatories for both sexes, also built with glazed bricks, with tiled floor, and fitted up with Twyford's urinals and water-closets. A boiler-house is provided, so that hot water can be obtained at any time for washing the stalls and fittings.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*Greek architecture is the flowering of geometry.*"—EMERSON.

Our Plates. THE block of three cottages at Tankerton, Whitstable, is about to be erected on the sea front for Mr. Ernest Beard, from designs by W. I. Chambers, architect, of Savoy House, W.C. The upper part will be finished with rough-cast and yellow beach pebbles, the bay windows and half timber work to be in English oak. The ground floor will be faced with dark red sand-faced bricks, and the roofs covered with brindled Broseley tiles. All the external woodwork will be painted white. Mr. Waring's Leyden drawings were made on a visit to Holland in fulfilment of the conditions of the Architectural Association Travelling Studentship, which he gained in 1898. The Stadhuis is a fine example of the Dutch Renaissance, having been erected in 1570. Stone is used throughout in its construction, and some good woodcarving is to be seen inside. An article dealing with Mr. Waring's tour was published in the BUILDERS' JOURNAL for February 22nd and March 8th, 1899. We are unable to give any particulars this week of the block of workmen's dwellings at Hull. These shall appear in our next issue.

Cardiff Asylum Competition. ABOUT fifty sets of designs for the new asylum which is to be erected at Whitchurch have been deposited at Cardiff Town Hall, and are now being considered by the assessor, Mr. G. T. Hine, F.R.I.B.A. A few particulars as to the general character of the new buildings as they will be when completed will therefore be of interest. In the first place, the building is to be erected on a site which, in respect to its admirable aspect and altitude, has already received the approval of the Lunacy Commissioners, and is within reasonably easy access of the town. The estate of which the site is a portion is that of Velindre, but it is stated that it is not proposed to alter this mansion at all, except to make it usable by a certain class of patients. In the first instance the asylum will be made to accommodate 800 patients, together with the large staff necessary in such an institution. The plans, however, allow an extension up to 1,250 patients, beyond which it seems undesirable to extend. Most of the local architects have sent in competitive plans, and these are largely supplemented by those of outsiders. It should be added that the present competition is intended to be a preliminary one, and not like that for the municipal buildings. Six designs have been selected out of the fifty sent in, and the six architects will enter into a second competition, the best set of plans submitted by one of these half-dozen being finally selected. The authors of the six selected plans are:—Messrs. Wills and Anderson (Swansea), J. Kirkland (Clapham Park), Greenaway and Newberry (Westminster), Law and Allen (Arundel Street, Strand), Hooley and Sander (Nottingham), Oatley and Skinner (Bristol). The estimates (which were, if anything, under the mark) varied from £195,000 to £226,000 for 800 patients, and from £224,000 to £296,000 for 1,250 patients.

The Forum Excavations. THE discoveries made by Signor Giacomo Boni in the course of his excavations in the Forum at Rome are most striking and play havoc with the accepted topography of the place. The Niger Lapis and Cippus with the archaic inscription, the Basilica Æmilia, the Sacrario of Mars, the house of the Vestals, and the many sacred wells scarcely possess the poetical interest of the discoveries now made under the site of the demolished Church of Santa Maria Liberatrice. Here were found first a magnificent Greek torso of an Apollo, then the Fons Juturnæ (a deep well crowned with a fine marble top), then an altar and other statues (all of the best Greek marble, worked in the best Greek style), and finally the Lacus

Juturnæ, which is at least 40 sq. yds. in extent, having in the centre a pedestal on which no doubt a statue of the nymph Juturna once stood. The fountain was most disgracefully treated by the Christians, and it is a striking epilogue to this desecration that, when the negligence of the Popes had allowed the Roman aqueducts to fall into ruin, the Christians should have been obliged to obtain water by sinking wells in the Forum at the very edge of the main sewer. Almost simultaneously with these discoveries Signor Boni, in another part of the Forum, near the Capitol, came on the rostrum of the Cæsars, which many writers have erroneously placed at a spot at some distance from the real site. In addition, a fourth cloaca maxima has been discovered. Since Signor Boni obtained the conjunction of the so-called cloaca maxima with the present main sewer of Rome he has been able to prevent the flooding of the Forum whenever the Tiber rises, and to explore the cloaca itself. This proceeding has led to the discovery of three other cloaca, each older and larger than the one hitherto known. They have proved to contain many fragments of splendid Etruscan vases and other interesting relics. The examination of the fourth cloaca, which has been sealed for at least two thousand years, will begin this week.

Brechin Cathedral. ON Saturday, September 22nd, the memorial stone in connection with the restoration of the Cathedral Church of Brechin was laid. The work is being carried out under the direction of Mr. John Honeyman, of Glasgow, and is estimated to cost about £12,000. It is believed that previous to the introduction of Christianity into Scotland Druidical rites were celebrated on the rocky knoll on which the present cathedral stands; and the disciples of St. Columba at a later date founded a cell there, and also a training college for priests and missionaries. The buildings then erected were probably mere wattle huts, similar to those which were put up at Iona and elsewhere. They would be superseded by more permanent buildings, but the only existing relic of the Culdees is the wonderful Round Tower, which has long been a subject of controversy among archæologists. The only other Round Tower in Great Britain is at Abernethy, in Perthshire, but both bear a resemblance to to the Round Towers of Ireland. The Bishopric of Brechin was founded about 1150, by David the First, and the present church was probably begun about that time. But the work in connection with the present restoration has proved that the building stands on the foundations of a much older edifice.

What the "Reconstructors" Did. BRECHIN CATHEDRAL was not injured much at the time of the Reformation: this work was left for the Philistines living at the beginning of the present century. The one object of the scheme was to make the building suitable for a parish church, and to secure the largest possible amount of sitting accommodation; and this is what the "reconstructors" did. The inners walls of the side aisles were removed, and the outer walls built up higher, the transepts demolished, and the clerestory windows in the nave hidden. The chancel arch was closed up and galleries were put all round the church, the pillars and walls of the nave being cut and defaced to receive the woodwork. To complete the destruction, a plastered ceiling was put across the whole building, hiding the roof and the beautiful tracery of the large west window, and the stonework of the nave was coated with plaster. The sapient architect who was responsible for this scheme even proposed to demolish the famous Round Tower and use the stones. But this economical proposal was prevented from being carried out. A neighbouring landed proprietor interfered, and threatened to hang from the top of the tower the first man who touched a stone!

Mr. Honeyman's Plans. MR. HONEYMAN'S plans provide for the complete restoration of the choir, the rebuilding of the aisle walls, the roofing of the aisles, the removal of the plaster roof, &c., and of the north, south and east galleries, re-roofing the nave, and building a north porch and small south transept. The operations are already fairly well advanced. The plaster ceiling has been taken down, and it has been found that the old clerestory is, happily, almost uninjured. In the foundations of the west gable of the south aisle a number of carved stones have been found which are believed to have formed part of a Norman building which stood on the site of the cathedral. Other pieces of Norman work have been found which still retain traces of coloured decoration.

THE SCHOOL-HOUSE, TEMPLE BALSALL. DRAWN BY E. STANLEY MITTON.

London University and Architecture. IN reply to Mr. Emerson's letter in the "Times" in connection with the fact that there is no Faculty of Architecture in the University of London (see last week's issue), Mr. T. Bailey Saunders says: "The University of London Act of 1898, in fixing the constitution of the Senate, did not, it is true, provide for any representation to be given to the Institute. But neither did it mention the Royal Society and some other distinguished bodies, . . . if the Institute was excluded from direct representation on the Senate, it was excluded in good company. But in no other respect is there, I think, much cause for dissatisfaction in regard to the position which architecture holds, and may hold, in the University. The President is technically right in saying that the statutes do not mention the subject, but if he will turn to those dealing with boards of studies he will find that certain boards enumerated in the annexed regulations are to be appointed, and amongst them 'A Board of Fine Art, including Architecture.' This provision embodies the recommendation of Lord Cowper's Commission. There is nothing whatever in the statutes to prevent the future Senate, if it so see fit, from recognising architecture as a branch of the faculty of science or of engineering. Nay, more, there is a particular statute enabling the Senate, if it so see fit, to conduct examinations of a professional character, jointly with institutions holding such examinations. . . . But the Senate cannot encourage systematic courses where none exist, or provide them itself without funds. So far as I am aware, there is no school of architecture in London at the present moment which has reached the level of efficiency displayed in the schools of medicine and engineering, or at all comparable with any of the more advanced schools of architecture abroad, of the standing, for example, of the department devoted to that subject in the great technical University of Charlottenburg, Berlin. With the amount of rebuilding that is in progress and in prospect in the metropolis, such a school might accomplish a great work. I am not unmindful of an association, protected to some extent by the Institute, which, without the command of any large resources, is yet doing useful service in the way of instruction. But its best friends can scarcely claim that it has now attained to University rank. When it develops, or when an efficient school for the study of architecture arises in London, it is hardly likely to be ignored by a University anxious to promote the interests of all branches of science and learning. But the promotion of those interests depends upon proper endowment, and there is no place of education in the Empire which is just now worthier of attention at the hands of generous donors than the University of London."

Temple Balsall School-house. THE illustration of this school-house shown on this page is from a drawing by Mr. E. Stanley Mitton, architect, of Birmingham. We have not been able to ascertain the exact date of its erection, but we are given to understand that this took place about thirty years ago from designs by Mr. Garner.

New National Museum at Munich. ON Saturday last the Prince-Regent of Bavaria opened the new National Museum at Munich, the novel arrangement of which is well worthy of study on the part of those who will be responsible for the proper display of our South Kensington possessions. The architect is Herr Gabriel Seidl, who built the important Annakirche in the town; the building cost £200,000, is of two floors, and contains no fewer than 100 rooms. The style is the nondescript which one finds in so many German buildings of the sixteenth century, where mediæval high-pitched roofs and round turrets come into quaint juxtaposition with doors and windows suggested by Italy. The leading principle adopted is that the rooms on the ground floor should show, in strict chronological order, Bavarian life at different epochs, from the little circular room which, in its architecture and in its contents, recalls the tenth and earlier centuries, down to the blue and gold magnificence of the late King Louis. In the early rooms, the sense of architectural evolution is greatly helped by the fact that the various castles of the Bavarian Crown have contributed ceilings, windows, &c.; and in many cases the rooms have been planned specially to receive these. One ceiling, from the Castle of Dachau, is of great beauty. But all kinds of other objects are shown—in fact, the Bavarian Museum neglects nothing, and is in consequence one of the most complete of its kind to be found in Europe.

Current Periodicals.

The British Clay-Worker for September expresses the opinion, in connection with the alleged injury to Westminster Abbey through the smoke from the potteries on the south side of the Thames, that, though the stone used in restoring the building during recent years is no doubt of excellent quality, "most of the stone used in olden times in the structure was about as bad as a stone can be." More than 200 years ago, Sir Christopher Wren was called in as an expert, and he alluded to some of the stone of the Abbey being considerably decayed, while 50 years ago some of the flying buttresses were found to be in a deplorable state—Messrs. Doulton and Messrs. Stiff had not then been long established. In conclusion, our contemporary says (and we endorse the opinion): "In view of the present state of our knowledge concerning the composition of the London atmosphere, we do not think anybody is justified in laying the disintegration of building stones in the metropolis at the door of any particular firms. As well might we charge them with causing the London fogs. Everybody who lights a fire contributes to the pollution of the atmosphere and the production of acids deleterious to the life of building stones—especially calcareous stones."

PLAN OF COTTAGES AT TANKERTON. W. I. CHAMBERS, ARCHITECT. (*For perspective see centre plate.*)

Pall Mall Magazine.—After an outburst which is not the climax of artistic writing, the writer of the article on "Wollaton Hall" in the October number of this magazine descends to "prosaic detail," and says that this magnificent building was erected in the days of Elizabeth by John Thorpe (of Padua) with his "architector," John Smithson. The work was begun in 1580 and finished eight years later. After an excellent description of Wollaton, the author closes with a note of sadness, for he says: "Sad is the gradual creep of the city down to the park walls; when the distance to lend enchantment will be absent from that view, when chimneys can no more appear as fairy spires, the gas-holders as mediæval granaries, and the big factories with their hard iron-framed windows lose charming value as ruddy blurs through the hazes of blue. Sad is the nighness of the local colliery, which it was left to the last generation to plant in the pretty village itself, and whose smouldering pit-bank generates sulphur fumes which will surely in time do to death the noblest trees." In the issue of the BUILDERS' JOURNAL for May 30th last will be found reproductions of John Thorpe's original designs for Wollaton Hall.

The Engineering Times.—Five shillings is the price of the special Paris Exhibition number of this magazine; and it is well worth this amount It is of course impossible here to do more than indicate the branches of engineering dealt with—railway plant, steam-engines, wood-working, electrical, milling, agricultural, metal-working and other machinery, oil and gas engines, pneumatic tools, &c.; but a few of the writer's conclusions may be noted. To begin with, he says that the show of Great Britain (in size) is contemptible; it will not compare even with that of Switzerland; and he blames the Royal Commission "for the disgraceful way in which British commercial interests have been trifled with at this great Exhibition." France has 30,000 exhibits, the United States 6,564, Germany 2,000, Russia 1,500—Great Britain 600, the same as British Columbia! "To say that we are represented would be absurd, and yet foreign buyers will think we are—and there is the sting." The illustrations are numerous and the printing is very good. As before stated, the number is an excellent one.

The Artist.—The September issue of this publication contains an article on "Rye" by Mr. G. Forrester Scott, illustrated with some pleasing sketches. The only other article of special interest to the architect is that on "Interiors and Furniture at the Paris Exhibition," among the illustrations to which we notice one titled, "Boudoir *by* 'L'Art Nouveau,' Paris," and another titled "Sofa, *by* 'L'Art Nouveau,' Paris." The italics are ours, as we always understood that "L'Art Nouveau" was a particular style.

Feilden's Magazine for September has a cover which accomplishes its object—that of catching the eye. Inside, however, is much of interest. Mr. R. G. Allanson-Winn contributes an article on groynes, while Mr. W. M. Twelvetrees, M.I.M.E., deals with the Central London Railway. "Some Notable Exhibits at the Paris Exhibition" and "Recent Bridges" are the titles of two other articles in this number.

The Antiquary.—Dealing with the new guard-house at the Tower, which was strongly condemned by us a short time ago, the following remarks are made in the October number of this publication: "The hideous ugliness of the new, cheap, red brick against, and by the side of, the old, gray, time-toned and time-stained stone of the ancient fortress, must be seen to be thoroughly realised. No one seems to know who is directly responsible for this gross act of vandalism, but the War Office must take the blame of, perhaps, the most wanton and outrageous architectural crime that has been committed for many years past." This number also contains "Notes on some Stone Finds at Killucan, co. Westmeath," by the Rev. W. Falkiner, M.R.I.A.

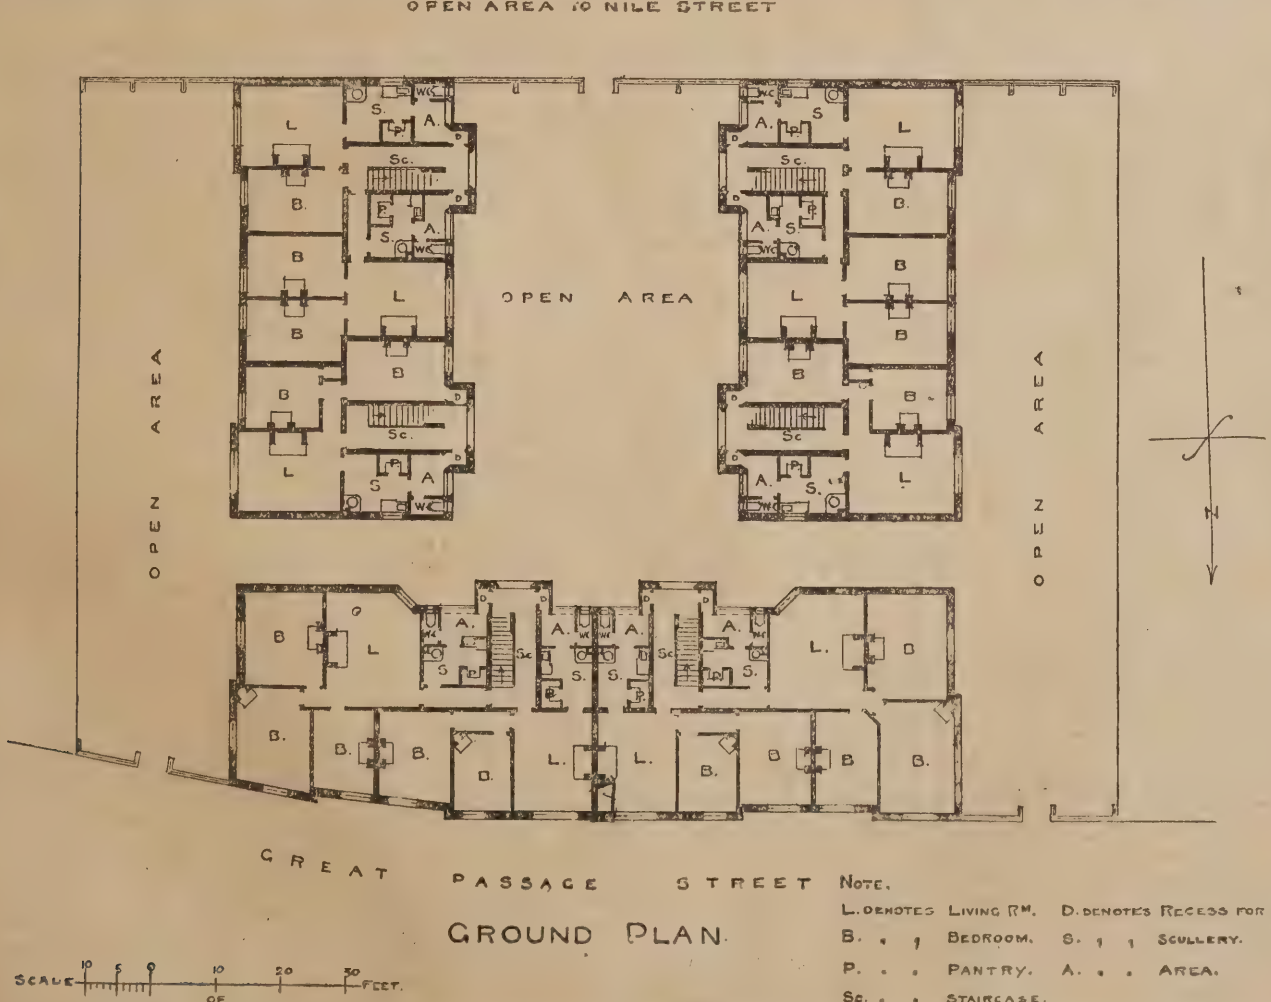
Harper's Monthly Magazine for October is a very interesting number. Mr. Chalmers Roberts supplies an illustrated article on Mr. Mortimer Menpes, who, besides being an artist, is a crack rifle-shot, a wrestler, and a raiser of prize fowls. His residence, 25 Cadogan Gardens, W., is described by himself as "a gold house, with a lace-work of delicate wood-carving on the gold," which is true, for your first impression is one of carved black wood everywhere over a ground of rich gold. All about the house are little Japanese lamps and lanterns enclosing electric lights; the decoration, however, is not copied from Japan, but Mr. Menpes' own production after a course of close study in the East. In fact, he is an artist to the finger tips, and one of the best known men in London.

Home Art Work for October completes another volume, and with the next issue its eighteenth year will commence. The designs presented include a good line drawing of an angel, after Fra Angelico. We note that some designs are promised during 1901 by Mr. G. C. Haité, Mr. F. Hamilton Jackson and Miss Bowley.

Journal of the Society of Architects.—The Society thinks it discerns a favourable change in the attitude of the R.I.B.A. in regard to architects' registration, and asks if it is not going too far to surmise that the leading association is gradually preparing itself "for the inevitable." We rather think the Institute would deny such an imputation; but we admire the Society of Architects for saying that they are disinterested enough "to place freely at the disposal of the Institute the results of the labours and expenditure of the past sixteen years, with only the reasonable proviso that the Institute shall definitely pledge itself to carry on the work." "Thunderstorms, and the Damage they Cause," is the title of Mr. Alfred Hands's paper in the number under review.

The R.I.B.A. Journal for September 20th contains an article by Mr. G. Hurst Seager, of Christchurch, New Zealand, on "Architectural Art in New Zealand." In regretting not being able to speak of the art *of* New Zealand, the author says: "Unfortunately, there has been no true development; we have no style, no distinctive forms of art. . . . All our methods are those of the Old World. . . . With a knowledge of the principles which govern the ancient work it is possible only to the most gifted to free themselves from the forms in which those principles are embodied." This view is borne out by a depressing series of illustrations. The only works which are truly characteristic of colonial life are the early wooden buildings put up by the first settlers, and these are mere imitations in wood of brick and stone forms. A paper read by Mr. J. Eadie Reid at a meeting of the Northern Architectural Association on "Some Principles of Christian Art Historically Considered" is included in the number.

American Architect.—It appears that, owing to some difficulty in determining its permanent site, the Dewey Arch in New York is causing dissension, and it is said that those who undertook to procure funds for rebuilding it in marble are ready to abandon the undertaking. Meanwhile the plaster structure is becoming so discoloured that by many it is regarded as an eyesore. A writer in the issue of this publication for September 1st says: "Marble fronts and marble statuary are out of place in city streets frequented by pigeons and sparrows, or where soot and dust must be deposited upon their horizontal surfaces, or in their carved recesses." Among the plates presented with this number are two of the first and second premiated designs in the recent Liverpool Dock Offices competition. In the issue for September 8th there is an interesting article by Mr. Paul Waterhouse dealing with Sens Cathedral (where William of Sens, "who laboured at the Canterbury Choir, and, as some say, planted the pointed arch in England, worked in 1168 and the preceding years"), Auxerre Cathedral and the surrounding country. The plates include two of Mr. Mountford's design for the new Sessions House and a beautiful photographic



reproduction of the Prudential Insurance Company's Office in Newark, N.J., of which Mr. George B. Post is the architect. It is about ten storeys high, and has been very successfully treated with an exterior built of large blocks of stone, giving it a substantial appearance. It is far ahead of the usual buildings of its class. The only thing worth noting in the issue for September 15th is the excellent article (continued) on the development of the acanthus and spiral scroll, which is illustrated by most suitable line drawings.

The Brickbuilder (Boston, Mass.) for August says: "The English-Portland cement held a high place in public favour for many years, and there were some contractors who used to claim that it was not possible to manufacture really first-class Portland anywhere except in England. But a protective tariff and large opportunities have changed all that. The English article has almost gone out of the market, and German cements have very largely taken its place, but these in turn are being supplanted by our own manufacture." In an article on "Brickwork of the Royal Châteaux of France," Mr. William T. Partridge deals with the Château de Maintenon, Château de Saint Germain-en-Laye, Fontainebleau and Versailles, and points out that with the Château de Saint Germain-en-Laye a new use of brickwork began, the colour of the brick being utilised; another innovation was the covering of the body of the building with stucco, and leaving pilasters, reveals and string-courses of red brick. Several illustrations are given in this issue of the designs by members of the T-square Club for a domestic establishment in the neighbourhood of Philadelphia: the winning design is by Mr. Lloyd Titus, who thus gains the European Travelling Scholarship. The plates presented with the issue under review are splendidly printed, but the designs are not remarkable for merit—the best is that of a New York house by Mr. Ernest Flagg.

The Architectural Review (Boston, Mass.).—In the August number there is an illustrated article by Mr. Glenn Brown in which suggestions are made for the grouping of Government buildings; but it deals almost entirely with Washington, and largely with a new boulevard proposed through the Mall, so its interest becomes localised. The view of the Capitol down Maryland Avenue shows, however, what an excellent effect is possible when the setting of buildings is thoroughly and intelligently considered. The genius of America, the dominant note of American life, is aspiration, and in attempting to monumentalise this Professor Désiré Despradelle designed the "Beacon of Progress," an obelisk 1 500ft. high, having a brilliant beacon light at its apex. The design was awarded the first medal in architecture at the Paris Salon this year; it is an extraordinary conception, but looks Egyptian rather than American. It is not proposed to be carried out. In dealing with the new Sessions House designs, criticism is free and hostile. They are described as being all bad in plan—the art of planning having been lost in England—though it is acknowledged that the best design is that by Mr. Mountford, which is considered dignified and expressive of its purpose. But on this side of the Atlantic the plan of this building has been thought excellent. Elevations and plans of the building for the Department of Architecture, Harvard University, by Messrs. McKim, Mead and White, are included among the plates: the planning is straightforward and good. The September number of this journal illustrates many small American houses: they vary in merit between atrociousness and passability; but they are printed in a manner which is greatly superior to similar work on this side of the Atlantic.

Stone (New York).—"Early Use of Second-hand Stone, and Jobbery at the Reformation" is the title (not an altogether pleasing one) of an article in the issue for August. There is a frontispiece showing the interior of the Mosque of Cordova. Concerning the columns, Edmondo de Amicis says in his book on Spain: "The Mosque of Cordova, which was converted into a cathedral after the overthrow of the Moors, but which must always remain a mosque, was built on the ruins of the original cathedral, a little way back from the bank of the Guadalquiver. Abdurrahman commenced its construction in the year 785 or 786 A.D. 'Let us rear a mosque,' said he, 'which shall surpass that of Bagdad, of Damascus, and of Jerusalem—a mosque which shall be the greatest temple of Islam, one which shall become the Mecca of the West!'" This he did. Other articles in this number are "The Formation of Limestones," "Ancient Picture Mosaics and the Tiles and Mosaics of Venice," "Spiral Staircases," and "Greek Marble."

Scientific American (Building Edition).—The issue for September contains a review of the "Architectural Annual" published under the auspices of the Architectural League of America. It contains the following remarks: "With few exceptions, until five or ten years ago architecture in the United States was but a business; now it is a recognised profession, although some of its members are not inaptly called by the 'Architectural Annual' nothing more than unscrupulous business men. . . . It is gratifying to note the advance in architectural design, but such advance seems to have been more amazing when the present state of architecture is considered. An architect is now paid, not in proportion to the excellence of his design, the watchfulness of his superintendence, or the conscientious effort on his part to minimise expense (of course not, such an arrangement would be impracticable), but in proportion to the entire cost of his work. This has encouraged the structural steel companies to include in their bids the service of an engineer who works out the construction, and has enabled terra-cotta companies to make detailed drawings from small scale sketches, without apparently charging either architect or owner for them. . . . A promising sign of the advance in the profession is the unanimous decision by its better element that open unlimited competitions are demoralising and unusually productive of most unsatisfactory results."

WORKMEN'S DWELLINGS, GREAT PASSAGE STREET, HULL. JOSEPH H. HIRST, CITY ARCHITECT, HULL. (*For perspective see centre plate*)

The Bricklayer and Mason (New York) for September contains an expressly-written article on "Compulsory Arbitration" by the Secretary of Labour for New Zealand. Considerable attention has recently been drawn in the British press to the excellent Arbitration Court established in our far-off colony; we could only wish that such results were made possible here.

La Revue de l'Art Ancien et Moderne (Paris).—The September number is entirely devoted to art exhibits at the Paris Exhibition. In regard to the sculpture, our contemporary says that little of importance emanates from this country, though Mr. Onslow Ford, Mr. Drury, Mr. Pomeroy and Mr. Frampton come in for a little praise. On page 197 is a line drawing of a metal milk jug, and on page 204 are three drawings of two candlesticks and an arm-chair: these are mentioned because of their splendid technique; though the greatest care has been taken by the artist, and every detail is accurately rendered, the result is not in the least laboured. In fact, the drawings are models of technique in their particular class, and equal those of Jacquemart and Bacher.

Die Kunst (Munich).—The October number is mainly an easel-picture number, and therefore of not much direct interest to our professional readers. But there are some good reproductions of British furniture and interior decoration at the Paris Exhibition. At the beginning, however, of the article accompanying these illustrations we are again informed that "England is badly represented." The work shown includes a tapestry designed by Burne-Jones and executed by William Morris, the result being very beautiful. The work of the Bromsgrove Guild of Applied Arts, of Mr. Cecil Brewer and of Messrs. Waring and Gillow is also included.

Professional Practice.

Cromford.—The new Wesleyan church and Sunday schools were opened on September 18th by the President of the Wesleyan Conference, the Rev. Dr. Allen. The buildings are on an excellent site in the centre of the town, and consist of the church, measuring 70ft. by 30ft., with a semi-octagonal rostrum, apse, organ chamber and minister's vestry; the schoolroom, 32ft. by 30ft.; an infants' room, 22ft. by 17ft.; and two classrooms, each 14ft. by 10ft. 6in. At the rear of the building are the boiler house and offices, and the heating chamber is underneath the rostrum. The materials used are local gritstone with Bentley Brook dressings, varnished pitch pine for internal fittings, wainscot and roofing, with Bath stone for internal arches and columns between chapel and schoolroom. The windows are glazed with stained lead lights and tinted Muranese glass. The style adopted is a free treatment of Gothic, and the interior arrangements and acoustic properties give entire satisfaction. Mr. William F. Bird, M.S.A., of Midsomer Norton, Somerset, is the architect, and the contractor Mr. William Boden, of Matlock Bank. The cost has been £2,000. The heating by hot water low pressure has been carried out by Messrs. Bates and Son, of Sheffield. The wrought-iron casements, gas fittings and ventilating appliances were made by Messrs. A. Gardiner, Sons and Company, of Bristol, and the rostrum railing by Messrs. W. Macfarlane and Company, of Glasgow.

Glasgow.—Public halls and public baths are to be erected at Kinning Park. Mr. Donald Bruce, of Messrs. Bruce and Hay, architects, 271 West George Street, the burgh surveyor, has prepared the plans. The expenditure will be about £20,000. The halls are to be erected on the north side of West Scotland Street, at the corner of Smith Street, and the baths on the south side of West Scotland Street, nearly opposite the halls. The principal entrance to the halls is from Smith Street by a flight of steps to a large vestibule, leading through glass doors to a crush hall, 65ft. by 12ft. Off the crush hall there are several ladies' and gentlemen's retiring rooms, lavatories, cloakroom, ticket office, and the stair which leads to the gallery of the large hall. The hall will be capable of accommodating 1,000 persons in the area, while the gallery will seat over 200. There will be a separate entrance to the platform from West Scotland Street, which can also be utilised as an entrance to the lesser hall, the committee rooms, reading room and library. On each side of the platform of the large hall there are other ladies' and gentlemen's retiring rooms, which in a case of emergency can be used in connection with the platform of the lesser hall. Immediately behind the platform of the larger hall there will be a four-manual hydraulic organ, with full pedal compass. Communicating with both halls there are other side rooms, to be used for booking purposes, and also a refreshment bar. The large hall will be lighted by side windows, and the lesser hall by roof lights. The heating and ventilation of the buildings will be on the most modern system. The frontage to Smith Street has a three-light Romanesque window over the main entrance, with minarets at each side, and a truncated gable with a niche in which the Goddess of Harmony is to be placed. The building is to be constructed of Dumfries polished stone, and when completed will be the most artistic building in this industrial suburb. Owing to the situation of the site upon which the baths are to be erected, the building will not have such a conspicuous appearance as the halls—only the north elevation, which faces West Scotland Street, being exposed. The swimming pond is 75ft. long by 37ft. broad, with a depth of 6ft. 9in. at the spring-board end and 3ft. 6in. at the shallow end. The interior of the building will be lined with white brick, and the floor of the passages with Italian mosaic having panelled borders. The water is to be heated by steam injectors. Around the pond will be seventy-six dressing boxes, also foot-baths, spray-baths and douches fitted up in an elaborate manner, together with private slipper baths of porcelain in white-glazed chambers. Over the dressing boxes there will be a gallery enclosed by handsome wrought steel panels and rails. Abutting the gallery will be a club room, which is situated in the roof over the main entrance.

London, S.W.—Six foundation stones of the U.M.S. Church, schools, &c., Fentiman Road, South Lambeth, were laid recently. The church is flanked on one side by a square tower, which is terminated by a small spirelet and weather vane, a staircase in it leading up to a small end gallery. A projecting narthex with the two main entrances forms a prominent feature of the design. The dressings are of Bath stone and the facings of red brick. The seating is circular on plan, so that the whole of the congregation immediately face the preacher. The preacher's platform or rostrum is placed centrally in an octagonal apse, where the choir is also accommodated. The organ chamber is arranged on one side of the apse, having organ fronts into both the church and the apse. The vestries are placed immediately behind the apse. A large schoolroom with a gallery is provided, together with additional classrooms and other conveniences. The school is placed by the side of the church, facing Fentiman Road. A suitable church parlour is provided, also fronting upon Fentiman Road. The style of the church is Perpendicular Gothic, freely treated. The contract for the whole block, including boundary walls, amounts to £6,506, and is let to Mr. J. O. Richardson, builder, Peckham. The architects are Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, 5 Clements' Inn, Strand, W.C.

Millport.—The new hospital at Millport is centrally situated on the rising ground behind Breakough Farm, about half a mile from the town, having a south-west exposure, the pavilions running approximately north and south. The hospital has been designed for the isolation of two different diseases, the south pavilion consisting of a four-bed ward for males, and a two-bed ward for females. The nurses' duty-room is situated immediately behind, and is so arranged as to overlook both apartments. The north pavilion consists of a two-bed ward for males and a one-bed ward for females, and is intended for the treatment of enteric fever. The one-bed ward will also be used for special cases and for the reception of private patients. The administrative block is situated to the south-west of the pavilion block, and in this building there is accommodation for caretaker, nurses, matron and servants. There is also provided a septic tank for the treatment of the sewage. The water supply is obtained from a spring considerably above the hospital, where it is stored, and allows the water to gravitate to the highest point of the building, the storage capacity being equal to eight days' supply for twenty persons at 30gals. per head per day. The accommodation is equal to the requirements of nine patients, allowing 2,000 cubic feet per adult. Considering that the greater proportion of the patients will be children, the local authority has in view the providing of several cots, when they will be able to accommodate three to four times the number of patients. The cost of the building will run close on £5,000. The plans are by Messrs. Fergus and Penman, architects, Largs, and the furnishings have been supplied by Messrs. Moore, Taggart and Co., Glasgow.

Reigate.—The foundation stone of the new municipal buildings now being erected in Castle Field was laid recently. Messrs. Mackintosh and Newman, of London, are the architects, and Mr. A. J. Amos is the clerk of works. The buildings are in three blocks: the main block, the fire station, and the house for the chief constable. The main block is divided into two portions, one of which is set aside for the transaction of the municipal business and the other for the work of the police and the borough court. The municipal portion will be provided with offices for the various officials of the Corporation, which will be kept together on the ground floor, while the first floor of the municipal portion is to be devoted entirely to the Council chamber. Committee rooms are to be arranged *en suite* for receptions, &c., with sub-committee rooms and rooms of that description. Thus the municipal business, the business of the Council chamber, and any receptions that may take place will be entirely apart from each other. In the police department, in the basement, will be the cells for prisoners and a large recreation room for the police. On the ground floor will be the various police offices, and the first floor will be entirely set apart for the borough court and such rooms as magistrates' rooms, solicitors' rooms, and rooms for witnesses, &c. Here there is a similar arrangement in the police department to the municipal department: each section of the building will be able to be used apart from every other section. In order to facilitate the arrangement, special attention has been paid to the entrances. The principal entrance will be set apart entirely for the use of the mayor and councillors, while the municipal business will be transacted entirely through a further entrance which is provided in the corridor which joins up to the fire-station block and the municipal block. The business of the borough court, too, will be transacted and kept apart from the police business by the use of that entrance, whilst the ordinary police work will be entirely served by a subsidiary entrance. The magistrates will be provided with a private entrance. The fire station will be on the highest point of the site, so that in the event of a fire the fire engine can get a good start. A look-out tower to the fire-station block will be provided. The tower also will serve for the purpose of hose drying. The chief constable's dwelling will be a small domestic building. The dimensions of the main block will have a frontage of 180ft., but there is a space of 22ft. between the main block and the fire-station block. The fire-station block itself has a frontage of 55ft., which gives a total frontage of 257ft. The corridor between the main block and the fire-station block will be joined up so as to give the whole of the buildings the appearance of one block, though it will be really separated by a space of 22ft. There will be an average depth of 50ft. The height of the main portion of the building, measured from the ground up to the parapet, will be 36ft., and the tower will be 70ft. The style of the building is to be Renaissance, freely treated. The chief constable's house will be rough cast and tiled.

Ulverston.—The Victoria Higher Grade and Technical School was opened recently. One and a half acres of a field abutting on Hart

Street form the site. The cost has been about £9,000. The school has a frontage of 175ft., and is of two storeys. Accommodation as a higher grade school for boys and girls is provided on the ground floor, and for technical and art classes on the first floor. Separate entrances for girls in the road lead to Ford Park, and for boys from the front of the building and also from Spent Lane. Ample playgrounds and offices are provided at the ends and rear of the school building. The entrances and staircases are so arranged that the rooms on the ground floor may be entirely cut off from the first floor, when the latter is in use by evening or exterior classes. The design is Victorian Classic in style, carried out in limestone, with red stone dressings. The building is to contain 380 boys and girls. On the ground floor is the school hall, large classrooms for boys and girls, cloakrooms, teachers' private rooms, workshop, kitchen and cookery centre with a separate entrance. The basement is taken up entirely with the heating apparatus. On the second floor are situated the lecture room, chemical and physical laboratories, storeroom, advanced and elementary art rooms, &c. The architect is Mr. J. Y. McIntosh, and Mr. J. Aldred clerk of works.

Westbury-on-Trym.—A new workhouse and infirmary for the Barton Regis Union Guardians is being erected at Southmead. The site of the workhouse is a commanding one. The Guardians have purchased 13½ acres of land, which form a healthy site. The workhouse and infirmary are on a small scale, and will be built on the pavilion system. No children will be kept in the workhouse, some being boarded out and the rest at two cottage homes situated about half a mile away, recently purchased by the Guardians. The workhouse buildings are divided into five main blocks:—Block A: Board room and clerk's offices. This block will be fenced off from the remainder of the workhouse buildings, and has a separate entrance for persons having business with the clerk, who is also superintendent registrar, or with the relieving officers, &c. Block B: Male and female tramp wards, with accommodation for 16 male tramps and eight female tramps, also four receiving wards, porter's lodge, clothes stores, and disinfecting chambers. The stone yard is placed at the back of Block B, and the porter's lodge is situated close to the main entrance to the workhouse buildings, so that the porter may have control of the access to and exit from the institution. Block C: Master's and matron's department, with accommodation for 82 inmates. The block consists of the master's house, which is placed in the centre, the main entrance to the block being alongside, dining room, kitchen, and stores department immediately behind, and on either wing pavilions two storeys in height, those on the right being for the women and those on the left for the men. A married couple's block for two married couples is also provided. At the rear of the pavilions are the laundry, carpenter's and shoemaker's shops, boiler-house, &c. In designing Block C the pavilion type of arrangement was adopted in preference to the old-fashioned style of workhouse because it gave a much better opportunity of classification, as well as thorough ventilation and light to each room. The inmates will be classified into four divisions in each sex. Block D: The infirmary ward has accommodation for twelve males and twelve females, divided into three separate wards on either side, so as to allow for the separation of doubtful cases. In the centre is the administrative department, consisting of kitchen, surgery, nurses' sitting room and nurses' bedrooms, and at the rear, connected by a covered-in way, is the lying-in ward for two women. Block E contains the mortuary and stables. The buildings have been designed in English Renaissance style and are plain in character. The whole site is surrounded by a wall which is nearly half a mile in length. Where it adjoins the road it is surmounted with railings, with ornamental pillars at the main entrances. The estimated cost of purchase of land, building and furnishing the whole of the above-mentioned blocks (which altogether have accommodation for 110 inmates and for 24 in the casual wards) is £32,852. The architects are Messrs. W. H. Thorp, of Leeds, and A. P. I. Cotterell, of Bristol. The boundary walls have been built by Messrs. W. and J. Bennett, and the foundations and buildings of the boardroom, clerk's offices, porter's lodge, casual wards, workhouse and infirmary, &c., are being carried out by Messrs. H. A. Forse and Sons, of Bristol.

Builders' Notes.

Creditors of the New Haslingden Plastic Brick Company, Limited, are required, on or before the 10th day of November, 1900, to send their names and addresses, and the particulars of their debts or claims, and the name or address of their solicitor, if any, to Mr. Harry Rothwell, of 2 Piccadilly Street, Haslingden, liquidator of the Company, which is to be wound up voluntarily.

The Building Trade of Newquay has met with a severe check. This is ascribed principally to the present demand for houses in Newquay not equalling the supply and the higher prices of labour and building materials. Dr. Martyn, formerly of Saltash, is building a residence for himself on the Pentire Estate. With the exception of two houses at Mount Wise in course of erection by Mr. William Tippett, there is little else going on in the building line.

A Warning to Builders.—Messrs. J. and H. Bangs, of 142 High Street, Camden Town, write as follows:—"In the interests of the trade we should like to call attention to what we fear is not an uncommon experience, in the hope that steps might be taken to avoid its recurrence as much as possible. At one of our jobs in Tavistock Square, after the men had left off work for the day, a decently-dressed man called and presented a note to one of the servants to the effect: 'Please give bearer brushes for me. J. Stone, foreman.' The girl, thinking it was all right, allowed the man to go and help himself, with the result that he took away all the men's brushes, although branded with our name. We suggest that if builders were to advise the domestics that no one has authority to remove any of the men's things after leaving-off time it would materially assist in the prevention of such frauds."

The Builders' Clerks' Benevolent Institution.—A meeting of the Committee of this institution was held at the offices, 21 New Bridge Street last week. The dinner committee presented their report on the dinner held in March last. In all, it was stated, 321 attended, and the funds of the charity benefited to the extent of £440, including £400 in donations and new subscriptions. The list of Mr. Henry Holloway, the president, alone totalled £315, and the valuable aid he thus rendered to the institution was acknowledged. The committee complimented the dinner committee on their work and the amount they had been instrumental in procuring. Mr. E. B. Gammon stated that as a result of these subscriptions by the end of the year they would be able to record the appointment of three new pensioners, the presentation of one orphan to the Orphan Working School, and the granting of several sums in the form of temporary relief.

Dissolutions of Partnerships.—Messrs. Charles Sutcliffe Crabtree and James Moorhouse, carrying on business as joiners and builders, at Lister Lane Joinery Works, Halifax, under the style or firm of "Crabtree and Moorhouse," has dissolved partnership from September 21st. All debts due to and owing by the firm will be received and paid by Mr. Charles Sutcliffe Crabtree, who will in future carry on the business in his own name and on his own account. The partnership between Messrs. Frederick John Rutter, Edward Rutter, and Algernon Rutter, carrying on business as brickmakers, at 41 Parliament Street, London, S.W., under the style or firm of D. and C. Rutter, has been dissolved by mutual consent as and from the first day of June, 1900, and in future the business will be carried on by Messrs. Frederick John Rutter and Edward Rutter alone, under the style of D. and C. Rutter. All debts due to and owing by the said late firm will be received and paid by them.

Halifax Building Trades Federation held a meeting recently, when Councillors Parker and Morley spoke on the benefits of federation, and of the desirability of all building trades being federated. Discussion followed, and it was hoped that, as a result of the meeting, the federation would be strengthened.

Wall Construction.—Reference was made last week to the Fireproof and Soundproof Wall Construction Company, Limited, and a few particulars were given of the patented system which they propose to acquire and work. On Tuesday in last week a demonstration was given in the Medici Room of the Hôtel Cecil to a number of pressmen, architects, builders and others, when the secretary of the company (Mr. E. P. Stanley) explained the advantages which the system afforded. The blocks used are 2ft. 8½in. long, 10in. deep, and 2in. thick, and are composed of a light fireproof material, five continuous tunnels being formed longitudinally through them for the purpose of checking the transmission of sound. By a simple arrangement of Z- and U-shaped iron clamps the whole partition or wall is made firm, and when a ½in. coat of plaster has been given to each side one solid strong mass is obtained. There can be no doubt that the system offers great advantages over brickwork, for not only is there a saving of weight and space, but not half the inconvenience is caused during erection. A room, for instance, may be permanently divided off by one of these partitions with very little trouble, noise and dirt. In flats and similar buildings where it is highly desirable to prevent sound passing from one room to another, or from one floor to another, the system should be largely employed. Any plaster may be used (for the slabs afford an excellent key), but the company's "Hygienic" variety is preferable; by its use a marble-like finish is obtained, besides which the surface can be washed down when required. As we have already pointed out, the fact that large corporations, leading architects, and builders of integrity have used and highly recommended the system is the best possible proof of its genuineness and value.

Three Builders' Bankruptcies.—At Dudley County Court, last week, John Henry Whittaker, trading as Whittaker and Company, residing and carrying on business at Dudley as a builder and contractor, was examined. The statement of affairs showed gross liabilities at £30,555, unsecured creditors £10,529, creditors fully secured, £19,984, the estimated value of the securities being £20,119, and a deficiency of £7,918. October 22nd was fixed for the adjourned hearing.—A receiving order in bankruptcy has been issued in the matter of Jabez Octavius Ford, builder, of 36 Tower Road, Eastbourne. The debtor has also been formally adjudicated. The statement of affairs shows liabilities—gross, £5,374 12s. 5d.; expected to rank, £1,301 18s. Including £1,128 13s. 4d., estimated by the bankrupt as the surplus from securities in the hands of creditors fully secured, the assets are put at £1,183 9s. 7d., leaving a deficiency of £118 8s. 5d. There are five creditors fully secured and forty-one unsecured. In his observations the Official Receiver says: "The bankrupt states he started as a builder in December, 1897, without capital, having previously been a journeyman carpenter, and that he does not think he is now insolvent if his properties could be sold for their full value."—The first meeting of creditors of Messrs. William Edwards and Edward Medway, who carried on business as builders and contractors at 19 Ethelred Street, Kennington Cross, Surrey, was held last week. It appears from their statements that they commenced business in March 1891, each of them providing £300 capital. They do not consider themselves to be insolvent, but state that want of capital has brought their business to a standstill. The liabilities were returned at £18,000 or £19,000, the assets being estimated to produce £21,000 or £22,000, a large portion of which consisted of the debtors' interest in building contracts. The creditors resolved that the debtors be adjudged bankrupt, and appointed Mr. F. W. Davis, chartered accountant, trustee of the estate, with a committee of inspection.

Keystones.

Marlborough Town Hall is to be reconstructed at a cost of £7,270.

The New Town Hall and Law Courts for Cardiff are to be commenced shortly.

A new Chancel at Buckley Church, Flintshire, is being erected as a memorial of Mr. W. E. Gladstone. The cost will amount to £2,000.

A new Church at Denaby Main has been opened. The total cost of the structure is £3,500. A vicarage, including a residence for a curate, has been erected near the church at a cost of £1,500. Messrs. Fowler and Smethurst were the architects.

Mr. Henry W. Dodd, M.S.A., of 54 and 55 London Wall, E.C., is the architect of five warehouses and alterations to two shops in Pitfield Street and Bowling Green Walk, E., now being erected by Messrs. W. Lawrence and Son, builders, at a cost of £5,337.

Roman Remains in Hayling Island.—Mr. Talfourd Ely, F.S.A., who has been engaged on the excavation of a Roman building in the "Towncil Field," Hayling Island, writes from Stoke, Havant, to say that he has now laid open the foundations of the outer wall for a distance of over 80ft. north of the point reached in 1898. The wall then turns, he says, at a right angle westwards, in which direction he has followed it for 60ft. He has also excavated one of the rooms, 18ft. square, where he found a brooch of bronze and blue enamel.

A Stained Glass Window at St. James's Church, Bristol, has been erected. It has been designed and executed by Messrs. Joseph Bell and Son, of Bristol, and is in the south aisle. It is 12ft. high and 8ft. 6in. wide. The four main lights containing the subjects are 9ft. high, and are surmounted by ornamental canopies. In the two centre lights the subject is "The Resurrection Morn," the subject on the left being "The Nativity," and on the right "The Crucifixion." In the tracery, with colouring of the same tone, are three angels bearing shields with emblems of the Passion, namely, scourging pillar, scourge, crown of thorns, cross, spear, reed and sponge, and on either side of these are shields with the inscriptions, "Alpha" and "Omega."

Extensions in Dublin.—In Dawson Street, Dublin, a new furniture warehouse is being erected for Messrs. Millar and Beatty, whose premises now extend from Grafton Street to Dawson Street, the connection being effected by an overhead bridge. The new building is five storeys high, and extends back about 180ft. to where it joins the old building. It is constructed specially for the furnishing trade, and will have a large arched entrance showing a window two storeys high. Several portions of the building are adapted for special fitments of the firm's own manufacture. The approaches to the different floors will be by wide staircases in easy stages, and when the warehouses are completed customers will be enabled to enter in Grafton Street and pass right through to Dawson Street. The furniture factory and upholstery workshops have been remodelled and fitted with additional machinery.

The Ancient Cross at Bitterley, Ludlow, in the churchyard, fortunately escaped destruction by the Puritans, and is still standing unharmed after more than 500 years. This tall tabernacle cross has, under the representation of the Crucifixion, some light and peculiar brackets that are almost unique and rather resemble thirteenth-century work. At the visit of Mr. A. E. Lloyd Oswell (the diocesan architect) to the church last year it was noticed the old cross was in a most critical condition. The shaft was considerably out of the upright and in danger of falling owing to the giving way of its foundation. The churchwardens, parishioners, and neighbours are to be complimented on their worthy action in preserving it. The cross is nearly 20ft. high, so that the task of preservation—not restoration—was a most delicate one; but it has been accomplished without taking down the shaft or removing any of the octagonal steps. Nothing has been altered, only insecurity has been replaced by firmness, not even the picturesque moss removed.

A Fever Hospital at Plaistow is being erected from designs by Mr. E. T. Hall, of 57 Moorgate Street, E.C., at a cost of £100,000.

Mr. James Prentice, a member of the firm of Messrs. Burns and Prentice, builders and contractors, of Dromore, died recently.

The new Infirmary in Acton Lane, Willesden, will be erected from the designs of Mr. A. Saxon Snell, architect, 22 Southampton Buildings.

A House with Corner Shop at Pitsea has been erected in the centre of the parish by Mr. C. Sheldrick from plans of Mr. H. G. Clark, of Wickford.

Four New Board Schools are now being built at West Hendon. The memorial stone of one which is to cost £17,916, including furniture, ventilation and heating, and which will accommodate 1,100 children, was laid last week.

The new Robert Hall Memorial Church, Leicester, has just been completed. The new church is situated in the Narborough Road, and is an effort of the Leicester Baptist Church Extension. The estimated cost is nearly £12,000, inclusive of the site.

Commissions for Sculpture for definite work, public and private, are increasing. Mr. Henry C. Fehr, among others, is profiting by the new demand for public monuments. He has been given the order for two "memorials," one to Ruskin, the other to Browning, both to be executed in marble, and to be erected in a public institution in London.

The School of Art Wood Carving, Imperial Institute, South Kensington, has been re-opened after the usual summer vacation. Some of the free studentships maintained by means of funds granted to the school by the Drapers' and the Cloth Workers' Companies are vacant. The evening class is for the present closed, but to meet the requirements of those professionally engaged during the week a special Saturday afternoon class is held. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

A Central Hall at Bermondsey, S.E., capable of seating 2,200 persons, has been opened in connection with the South London Wesleyan Mission. The building is situated in Bermondsey New Road, and is the first of its kind in London. The designs for the new structure were furnished by the Rev. H. T. Meakin. The exterior is of red brick. The main entrance is through a central archway beneath the tower. The plan of the hall is that of a square with the corners cut off. Below this hall is another capable of accommodating 600 persons, and there are other rooms for clubs, &c. The hall is lighted by electricity, and the heating will be done by hot air, forced throughout the building by an electric motor. The total cost is £30,000, of which £23,000 has been secured.

The R.I.B.A. Examinations, November, 1900.—The examinations will be held as follows:—The Preliminary Examination, qualifying for registration as Probationer R.I.B.A., on November 6th and 7th. Applications must be sent in on or before Saturday, October 13th. The Intermediate Examination, qualifying for registration as Student R.I.B.A., on November 6th, 7th, 8th, and 9th. Applications must be sent in on or before Saturday, October 13th. The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., from November 16th to the 22nd inclusive. Applications must be sent in on or before Saturday, October 27th. The Testimonies of Study, &c., with the necessary fees, should accompany the applications, all of which should be addressed to the Secretary R.I.B.A., at the offices of the Institute, 9 Conduit Street, W. Examinations qualifying for the office of District Surveyor in London (pursuant to the provisions of the London Building Act 57 & 58 Vict. c. ccxiii. s. 140) and of Building Surveyor under Local Authorities will be held by the Royal Institute on October 25th and 26th, 1900. Applications must be sent to the Secretary R.I.B.A. on or before Thursday, October 11th. All applications must be made on the official forms, to be obtained from the Secretary.

A new School at Edmonton is to be erected in Croyland Road. Designs have been prepared by Mr. H. W. Dobb, of 54 and 55 London Wall, E.C.

Mr. Sidney Cooper, R.A., has entered upon his ninety-eighth year. Notwithstanding his great age, the output of work of the veteran artist shows but a slight decrease. He is still usually in his studio by eight o'clock in the morning, and walks out or drives in the afternoon.

Walsall Municipal Buildings Competition.—On the recommendation of the Assessor, Mr. J. Macvicar Anderson, F.R.I.B.A., the General Purposes Committee of the Corporation have recommended the Council to adopt the design of Mr. J. Glenn Gibson, of 4 Gray's Inn Square, London, W.C. The other premiated designs in order of merit are those sent in by Messrs. Cranfield and Potter (London), Messrs. Pite and Balfour (London), Messrs. Cackett and Burns Dick (Newcastle-upon-Tyne) and Mr. James A. Bowden (London), each of whom becomes entitled to a premium of £100.

Crediton Parish Church has been fitted with new chancel stalls, the erection of which completes the work of reseating the church, commenced in 1887 in commemoration of the Queen's Jubilee. The estimated cost is nearly £400, of which £300 has been raised. The new stalls, which are of oak grown in the neighbourhood, seat about 40 persons. The bench ends are richly carved, as also are the front book boards. The side walls of the chancel between the main columns have been reduced 6in. in thickness, thereby exposing to view the shafts and bases of the columns which have been hitherto buried in the walls.

"French Architects and Sculptors of the Eighteenth Century" is the title of a book by Lady Dilke which carries forward the work begun in the authoress's "French Painters." In the new, as in the former book, representative men in each department are chosen, and typical examples of their works selected. The architects are seen to be engaged in "solving the problems connected with the creation of the modern house, remodelling old palaces, such as the Hôtels de Toulouse and de Soubise; erecting stately official monuments, of which the fine Garde-meuble of the Place de la Concorde is an admirable type; and building dwelling places, the charm of which still hangs about the walls of the Petit Trianon and the lovely Hôtel de Salm." The authoress shows how the sculptors give a new direction to the "sculpture d'appartement." She traces the tradition by which the sculptors were guided, and gives us many interesting particulars concerning their lives. The work is announced by Messrs. Bell and Sons.

The Worshipful Company of Plumbers.—At the quarterly meeting of the Court, held at the Guildhall last Saturday, Mr. Charles Hudson was sworn into the office of Master and Mr. Alderman Richard Hind and Alderman Sir John Knill into the offices of Warden and Renter Warden respectively for the year ensuing. Dr. F. J. Waldo, medical officer of health for Temple and St. George's, Southwark, and Dr. Reginald Dudfield, medical officer of health, Paddington, were admitted to the freedom and livery of the Company. A copy of a memorial to Mr. Balfour was laid before the Court calling attention to the desirability of the Government's dealing with the registration of qualified plumbers in the interest of the public health. It was reported that the following resolutions were passed at the Tenth International Congress of Hygiene and Demography held in Paris:—(1) That all plumbers' work, as much in the supply of drinking water as in the removal of soil or slop water, should be the object of particular attention. The pipes for the distribution of water, as well as the hydraulic apparatus (reservoirs, syphons, &c.) and the down pipes for slop water, should be completely protected from frost. (2) That a professional education with a test examination before obtaining a diploma should be demanded of "sanitary plumbers" with a view to spreading among plumbers a knowledge of hygiene and of rational and economic construction in their work.

Surveying and Sanitary Notes.

Manchester Improvements.—A meeting of the General Purposes Committee of the Manchester City Council had under consideration last week the proposed widening and improvement of Corporation Street, Cannon Street, Cateaton Street, Hanging Ditch, Market Street, Market Place, and Old Millgate. There were three schemes, the largest of which was estimated to cost £500,000, the second £300,000, and the third £200,000. It was decided to apply for Parliamentary powers in pursuance of the scheme involving the smallest outlay.

Water Supply of India.—A report on the work of the Geological Survey during the year 1899-1900 states that the director of the survey has been endeavouring to ascertain the chances of increasing the water supply by means of artesian borings. It had been insinuated that Government had neglected its duties by not resorting more frequently to artesian well-sinking. An immense mass of official papers, says the director, proves the contrary. Attempts have been made in various parts to sink artesian wells, but with indifferent success, except in the Quetta district.

Insanitary Essex.—A few weeks ago an epidemic of typhoid fever broke out in the village of Roxwell, near Chelmsford, among the cottagers, and a number of deaths resulted. The villagers had been drinking from a brook which acted as the sewer of a group of other houses higher up the stream. When the matter was reported to the Rural District Council it was found that Roxwell had to depend upon the polluted brook for this necessary of life. In Essex there are now forty-one cases of infectious disease in half-a-dozen villages, the epidemic is spreading, and the isolation hospital is full.

The Sanitary Condition of Windsor has been censured by Dr. Bulstrode, a Local Government Board inspector, in a report to the Board. Complaints of smells from the sewers he attributes to the main outfall being made to act for the greater part of each twenty-four hours as a storage tank. There is room for much improvement, too, he says, in dealing with the house refuse in the poorer parts. The accumulation of heaps of refuse, partly vegetable and partly animal, upon the bare ground cannot, he argues, be good for health. Dilapidations, darkness, dampness, overcrowding and inadequate water supply are some of the defects he finds in certain properties. The report winds up with a lecture to the authorities as wanting in the initiating and guiding force necessary for vigorous administration.

American Asphalt Combine.—Particulars have been published in New York of the scheme for amalgamating the principal asphalt companies in the United States. The new company is to be called the National Asphalt Company, and the capital will be $22,000,000. In addition there is an authorised issue of $6,000,000 twenty-year collateral gold bonds. The National Asphalt Company will take in all the Barber properties, the Asphalt Company of America, the Pennsylvania Asphalt Company, Gilson Asphaltum Company, which controls the Gilson Asphaltum Company of St. Louis, owning mines in Utah, and the Gilsonite Roofing and Paving Company of St. Louis, which has an extensive paving business in western cities. It will also combine the New Jersey-Mexican Asphaltum Company, which has two leases of important asphalt properties near Tuxpan, Mexico; Manhattan Trap Rock Company, which owns valuable quarry lands and appurtenances at Upper Nyack, Rockland County, New York; titles to three valuable asphalt deposits upon the east shore of Lake Maracaibo, in Venezuela, known as El Mene, Templador and Laguinillas. These properties taken over by the National Asphalt Company give it an important control of the best raw asphalt deposits on the American continent. The officers of the company are: President, Amzi L. Barber; first vice-president, John M. Mack; second vice-president and general consul, Avery D. Andrews.

New Companies.

Incorporated Bristol Channel Timber Importers' Association.

This company was registered on September 19th with 50 members, each liable for £5 in the event of winding up, to promote the interests of the timber trade generally. The management is vested in a committee.

County Louth Granite Quarries, Limited.

This company was registered on September 12th with a capital of £20,000 in £1 shares to acquire a lease of certain granite property at Earl's Quarter Bush, County Louth, Ireland, and to carry on the business of quarry and mine owners, mineral merchants, &c. The first directors are A. S. Caine, E. Littlejohn and J. McAuslane. Registered office: 60 Watling Street, E.C.

County of London Estates Company, Limited.

This company was registered on September 24th with a capital of £5,000 in £1 shares to take over from J. G. Arrow a contract with Mary Christie-Miller and S. R. Christie-Miller for the acquisition of certain freehold properties in Solon New Road and Bedford Road, Clapham, and to deal in property of any kind. The first directors (to number not less than two nor more than four) are R. Price, J. G. Arrow and R. A. Price.

British Iron Foundry Company, Limited.

This company was registered on September 24th with a capital of £20,000 in £1 shares, to carry on the business of ironfounders, merchants and agents, dealers in stoves, mantels, railings, radiators and sanitary appliances, &c. The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers. Registered office: 220 Upper Thames Street, E.C.

William Stead, Limited.

This company was registered on September 22nd with a capital of £10,000 in £10 shares to acquire the business carried on at Brighton as William Stead, and to carry on the business of upholsterers, house decorators and wholesale and retail dealers in household furniture, ironmongery, turnery, household fittings and utensils, ornaments, hardware, &c. The first directors (to number not less than two nor more than five) are A. F. Griffith and G. J. Horlock.

Stokell, Limited.

This company was registered on September 21st with a capital of £5,000 in £1 shares to adopt an agreement with T. W. Stokell and to carry on the business of painters, decorators, paperhangers, paper merchants, oil, paint, varnish and brush merchants, &c. The first directors (to number not less than three nor more than seven) are T. W. Stokell, W. Canham, J. Proud, F. W. Appleyard and R. H. Barker. Registered office: Chapel Buildings, Lynn Street, West Hartlepool.

British Power Traction and Lighting Co., Ltd.

This company was registered on September 15th with a capital of £52,000 in £1 shares, of which 50,000 are preference, to adopt and carry into effect agreements made between the Engineer Cycle Works, the Eclipse Copper Company, the Anglo-American Motor Car Manufacturing Company, the Power Transmission and Traction Company and G. J. Gibbs, and generally to carry on the business of machinery manufacturers, metal founders, mechanical, electrical, and general engineers, smiths, ironmongers, contractors, &c.; as ironmasters, iron, brass and metal founders, engineers, metallurgists, &c. The first directors (of whom there shall not be less than three nor more than seven) are to be elected by the signatories—A. Hodgson, G. J. Gibbs, C. Midgley, A. E. Miethe, W. Peddie, W. H. Spencer and M. Patchett.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

BRITON FERRY, Glam.—For the construction of a brick sewer (700 yards) for the Urban District Council. Mr. H. Alec Clarke, engineer, Council Offices, Briton Ferry. Quantities by the engineer:—

J. Sutherland	£2,397 0 0	T. Waters	£1,475 19 6
J. Williams	1,911 0 0	W. Thompson	1,486 1 1
J. Grove	1,604 18 5	H. Jones, Briton Ferry*	1,434 10 0
L. Gower	1,600 0 0		

* Accepted. [Engineer's estimate, £1,450.]

BRISTOL.—For the erection of the superstructure of the offices and depot of the Public Benefit Boot Company (Lennards Limited), Park Place, Clifton. Mr. H. Dare Bryan, architect, 38 College Green, Bristol. Quantities by Messrs. Bernard & Pearson, Bristol:—

	Bath.	Doulting.	Ham Hill.

Perry & Co., Bow, London	54,300	56,500	58,150
Hayward & Wooster, Bath	53,700	56,010	57,100
Parnell & Son, Rugby	53,407	55,860	57,000
J. Long & Sons, Bath	52,210	54,600	56,590
A. J. Beaven, Bristol	50,700	53,100	54,900
Stephens & Bastow, Bristol	48,324	50,624	50,624
Cowlin & Son, Bristol	48,124	50,496	52,079
Shillitoe & Son, Bury St. Edmunds	42,950	46,000	46,500
R. Wilkins & Son, Bristol	41,680*	44,900	45,600

* Accepted at the reduced tender of £33,774.

CROYDON.—For the erection of schools, Portland Road, South Norwood, for the Croydon School Board. Mr. H. Carter Pegg, architect, 187 Brigstock Road, Thornton Heath:—

Foster Bros.	£25,362	W. Smith & Son	£19,500
S. Redhouse	21,165	Akers & Co.	18,949
Patman & Fothering-ham	20,771	J. Smith & Sons	18,881
		E. J. Saunders, Croydon*	17,800

* Accepted.

LONDON.—For the erection of nurses' home and additions to kitchen at Church Lane, Tooting, for the Guardians of the Wandsworth and Clapham Union. Mr. Cecil A. Sharp, architect, 11 Old Queen Street, Queen Anne's Gate, S.W.:—

Garrett & Son	£3,108 10 0	Akers & Co.	£2,447 0 0
R. A. Jewell	2,788 7 4	Huntley Bros.	2,398 0 0
Cropley Bros.	2,750 0 0	Foster Bros., Norwood Junction*	2,296 0 0
H. Wall	2,659 0 0		
W. H. Lascells	2,503 0 0		

* Accepted.

PORTSMOUTH.—For the erection of power station buildings and chimney-shaft, Vivash Road, Fratton Grove, for the Corporation. Mr. E. Rotter, C.E., Town Hall, Portsmouth. Quantities by Messrs. Rake & Cogswell, Prudential Buildings, Portsmouth:—

Light & Son	£12,200 0 0	J. J. Cockerell	£11,075 0 0
W. W. Learmouth	11,473 0 0	W. W. Evans	10,990 0 0
Clark & Son	11,450 0 0	M. Coltherup	10,826 8 5
T. W. Quick	11,45[illegible] 0 0	J. W. Perkins, Clive Road, Portsmouth*	10,515 8 0
W. Ward	11,30[illegible] 0 0		
J. Croad	11,200 0 0		

* Accepted.

WAKEFIELD, Yorks.—Accepted for the erection of Wesleyan Church and Sunday Schools at Newton Lane End, for the Committee. Messrs. Garside & Pennington, architects, Pontefract, Castleford, and Selby. Quantities by the architects:—

Brickwork.—Armitage, Outwood... £1,470 12 0
Joinery.—J. W. Harrop, Ossett ... 629 14 0
Plumbing.—J. H. Wilson, Outwood ... 202 0 0
Plastering.—Lockwood, Castleford ... 135 15 0
Slating.—Pickles Bros., Leeds ... 270 0 0
Painting.—Geo. Thompson, Leeds ... 84 0 0

PENRITH.—For additions to the Brunswick Road Board Schools, for the Penrith School Board. Messrs. G. Watson & Son, F.I.S.A., architects, 3 St. Andrew's Place, Penrith:—

Masonry, &c.
